PHYSICS ABSTRACTS

Physics Abstracts is one of a series of abstracts publications produced by INSPEC. Published twice monthly by the Institution of Electrical Engineers, it forms the world's major English-language abstracting service for the physics community.

SUBJECT SCOPE & COVERAGE

Physics Abstracts covers the whole field of physics. An impression of its scope can be gained from the classification scheme. The information contained in *Physics Abstracts* is derived from a wide range of sources including journals, reports, books, dissertations and conference papers published in all countries and languages of the world.

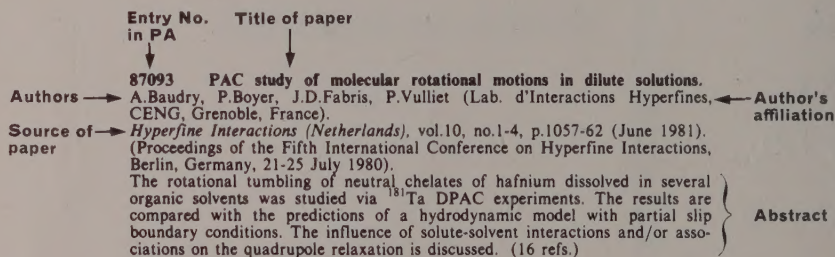

The number of items included is currently running at over 100,000 per year.

JOURNALS SCANNED

A list of the journals scanned for the INSPEC services is published with the twice-yearly author indexes to *Physics Abstracts*. Additions and amendments to this list are included in *Physics Abstracts* towards the end of the first issue for each month.

FORM OF ENTRY

All entries in *Physics Abstracts* follow the same basic pattern. The following example identifies the individual parts of a typical entry for an article from a journal.

Entries for other types of material differ mainly in the reference to the source, e.g., a report will refer to the report series and the number of the individual report. A conference paper on the other hand will normally refer to the title, place and date of the conference at which the paper was given.

SUBJECT ARRANGEMENT & SUBJECT GUIDE

The abstracts are arranged by subject in accordance with the scheme in the CLASSIFICATION and CONTENTS which appears opposite. The page number for the start of each subject section is given. An alphabetical index to the scheme—the SUBJECT GUIDE—follows the CLASSIFICATION and CONTENTS.

SUBJECT INDEXES

Detailed twice-yearly subject indexes to the individual entries are provided separately, covering the periods January-June and July-December. In these SUBJECT INDEXES each major concept occurring in each paper abstracted is indexed under headings drawn from the INSPEC Thesaurus.

AUTHOR INDEX

At the end of each issue, an alphabetical index of authors is provided showing the entry number of the items written by them. These indexes are cumulated every six months and, with the addition of the title of the individual papers, are published separately to cover the periods January-June and July-December of each year.

SUBSIDIARY INDEXES

Where appropriate, the following subsidiary indexes are included for the convenience of users:

Bibliography index of articles where a significant list of references or bibliography is contained.

Book index of books received and abstracted.

Corporate Author index where a corporate organisation rather than an individual is responsible for publication. This index includes all reports.

Conference index with reference to individual papers.

Subscription prices and ordering procedure are shown on the inside back cover.

PHYSICS ABSTRACTS is published twice monthly by the Institution of Electrical Engineers in association with the Institute of Electrical and Electronics Engineers Inc. Printed by Unwin Brothers Limited, The Gresham Press, Old Woking, Surrey. 2nd Class postage paid at Piscataway, N.J. 08854, USA. POSTMASTER: Send address changes to INSPEC/IEEE SERVICE CENTER, 445 Hoes Lane, Piscataway, N.J. 08854.

No part of this publication may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, electronic, mechanical, photocopying, recording or otherwise without the prior permission of the Institution of Electrical Engineers.

CLASSIFICATION AND CONTENTS

The abstracts are arranged by subject in accordance with the following scheme. The page number for each section is given. The CLASSIFICATION AND CONTENTS is followed by an alphabetical guide to the scheme, the SUBJECT GUIDE.

The classification scheme is the result of cooperation between INSPEC, the American Institute of Physics, the European Physical Society and the Physics Working Group of the ICSU-AB.

0000	GENERAL	4751	0620H	Measurement standards and calibration	4767

0340	Classical mechanics of continuous media: general mathematical aspects	4757	0762	Detection of radiation (bolometers, photoelectric cells, i.r. and submillimetre waves detection)	4774
0340D	Mathematical theory of elasticity	4757	0765	Optical spectroscopy and spectrometers	4774
0340G	Fluid dynamics: general mathematical aspects	4757	0765E	UV and visible spectroscopy and spectrometers	4775
0340K	Waves and wave propagation: general mathematical aspects	4757	0765G	IR spectroscopy and spectrometers	4775
0350	Classical field theory	—	0768	Photography, photographic instruments and techniques	4776
0365	Quantum theory; quantum mechanics	4757	0775	Mass spectrometers and mass spectrometry techniques	4776
0370	Theory of quantized fields	—	0777	Particle beam production and handling; targets	4776
0380	General theory of scattering	4759	0780	Electron and ion microscopes and techniques	4777
			0785	X-ray, gamma-ray instruments and techniques	4778
			0790	Other topics in specialised instrumentation	4778
0400	RELATIVITY AND GRAVITATION	4759	1000	THE PHYSICS OF ELEMENTARY PARTICLES AND FIELDS	4778
0420	General relativity	4759			
0430	Gravitational waves and radiation: theory	4760	1100	GENERAL THEORY OF FIELDS AND PARTICLES	4778
0440	Continuous media; electromagnetic and other mixed gravitational systems	4760	1110	Field theory	4778
0450	Unified field theories and other theories of gravitation	4760	1120	S-matrix theory	4780
0460	Quantum theory of gravitation	4761	1130	Symmetry and conservation laws	4780
0465	Supergravity	4761	1140	Currents and their properties	—
0480	Experimental tests of general relativity and observations of gravitational radiation	4761	1150	Dispersion relations and sum rules	4782
0490	Other topics in relativity and gravitation	—	1160	Complex angular momentum; Regge formalism	—
			1180	Relativistic scattering theory	4782
			1190	Other topics in general field and particle theory	—
0500	STATISTICAL PHYSICS AND THERMODYNAMICS	4761	1200	SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS	4782
0520	Statistical mechanics	4761	1210	Unified field theories and models	4782
0530	Quantum statistical mechanics	4762	1220	Models of electromagnetic interactions	4783
0540	Fluctuation phenomena, random processes, and Brownian motion	4762	1220D	Specific calculations and limits of quantum electrodynamics	4783
0550	Lattice theory and statistics; Ising problems	4765	1220F	Experimental tests of quantum electrodynamics	4783
0560	Transport processes: theory	4766	1225	Models for gravitational interactions	—
0570	Thermodynamics	4767	1230	Models of weak interactions	4783
0590	Other topics in statistical physics and thermodynamics	—	1235	Composite models of particles	4783
			1235C	General properties of quantum chromodynamics (dynamics, confinement, etc.)	4783
0600	MEASUREMENT SCIENCE, GENERAL LABORATORY TECHNIQUES, AND INSTRUMENTATION SYSTEMS	4767	1235E	Applications of quantum chromodynamics to particle properties and reactions	4784
0620	Metrology	4767	1235H	Phenomenological composite models of particle structure and reactions (partons, bags, etc.)	4785
0620D	Measurement and error theory	4767	1235K	Other composite models	4785
0620F	Units	—			

	page		page		
1240	Models of strong interactions	4786	2360	alpha decay	4797
1240E	Statistical models	4786	2390	Other topics in nuclear decay and radioactivity	—
1240F	Bootstrap models	—			
1240H	Duality and dual models	4786	2400	NUCLEAR REACTIONS AND SCATTERING:	
1240K	Hadron classification schemes	—		GENERAL	4797
1240M	Complex angular momentum plane; Regge poles and cuts (Reggeons)	—	2410	Nuclear reaction and scattering models and methods	4797
1240P	Absorptive, optical, and eikonal models	—	2410H	Optical and diffraction models	4798
1240Q	Potential models	4786	2430	Resonance reactions and scattering	4798
1240R	Peripheral models (one or more particle exchange)	—	2450	Direct reactions	4798
1240S	Multiperipheral and multi-Regge models	4786	2460	Statistical theory and fluctuations	4798
1240V	Vector-meson dominance	4786	2470	Polarization in reactions and scattering	4798
1270	Hadron mass formulas	4786	2475	General properties of fission	4799
1290	Miscellaneous theoretical ideas and models	4786	2490	Other topics in nuclear reactions and scattering, general	—
1300	SPECIFIC REACTIONS AND PHENOMENOLOGY	4787	2500	NUCLEAR REACTIONS AND SCATTERING:	
1310	Weak and electromagnetic interactions of leptons	4787		SPECIFIC REACTIONS	4799
1315	Neutrino interactions	4787	2510	Nuclear reactions and scattering involving few-nucleon systems	4799
1320	Leptonic and semileptonic decays of mesons	4787	2520	Photonuclear reactions and photon scattering	4799
1325	Hadronic decays of mesons	4787	2530	Lepton-induced reactions and scattering	4799
1330	Decays of baryons	4787	2540	Nucleon-induced reactions and scattering	4799
1335	Decays of leptons	—	2550	^2H - and ^3H -induced reactions and scattering	4800
1340	Electromagnetic processes and properties	4787	2560	^3He - and ^4He -induced reactions and scattering	4800
1340D	Electromagnetic mass differences	—	2570	Heavy ion induced reactions and scattering	4800
1340F	Electromagnetic form factors; electric and magnetic moments	4787	2580	Meson- and hyperon-induced reactions and scattering	4801
1340H	Electromagnetic decays	4788	2585	Fission reactions	4802
1340K	Electromagnetic corrections to strong and weak interaction processes	4788	2588	Fusion reactions	4802
1360	Photon and charged-lepton interactions with hadrons	4788	2590	Other topics in nuclear reactions and scattering: specific reactions	4802
1360F	Elastic and Compton scattering	4788			
1360H	Total and inclusive cross sections	4788	2700	PROPERTIES OF SPECIFIC NUCLEI LISTED BY	
1360K	Meson production	4788		MASS RANGES	4802
1360M	Meson-resonance production	4788	2710	$A \leq 5$	4802
1360P	Baryon and baryon resonance production	—	2720	$6 \leq A \leq 19$	4803
1365	Hadron production by electron-positron collisions	4788	2730	$20 \leq A \leq 38$	4803
1375	Hadron-induced low- and intermediate-energy reactions and scattering, energy ≤ 10 GeV	4789	2740	$39 \leq A \leq 58$	4803
1375C	Nucleon-nucleon interactions, including antinucleon, deuteron, etc. (energy ≤ 10 GeV)	4789	2750	$59 \leq A \leq 89$	4803
1375E	Hyperon-nucleon interactions (energy ≤ 10 GeV)	—	2760	$90 \leq A \leq 149$	4803
1375G	Pion-baryon interactions (energy ≤ 10 GeV)	4789	2770	$150 \leq A \leq 189$	4803
1375J	Kaon-baryon interactions (energy ≤ 10 GeV)	4789	2780	$190 \leq A \leq 219$	4803
1375L	Meson-meson interactions (energy ≤ 10 GeV)	4789	2790	$220 \leq A$	4803
1385	Hadron-induced high- and super-high-energy interactions, energy > 10 GeV	4789	2800	NUCLEAR ENGINEERING AND NUCLEAR	
1385D	Elastic scattering (energy > 10 GeV)	4789		POWER STUDIES	4804
1385F	Inelastic scattering, two-particle final states (energy > 10 GeV)	4790	2820	Neutron physics	4804
1385H	Inelastic scattering, many-particle final states (energy > 10 GeV)	4790	2841	Fission reactor theory and design	4804
1385K	Inclusive reactions, including total cross sections, (energy > 10 GeV)	4790	2842	Fission reactor materials	4804
1385M	Cosmic ray interactions	—	2842H	Fuel preparation and reprocessing	4812
1388	Polarisation in interactions and scattering	4790	2843	Fission reactor operation	4813
1390	Other topics in specific reactions and phenomenology of elementary particles	4791	2844	Fission reactor protection systems, safety and accidents	4814
			2850	Fission reactor types and applications	4817
			2852	Fusion reactors	4817
			2858	Integrated reactor systems	4823
			2870	Nuclear explosions	4823
			2880	Radiation technology, including shielding	4823
			2890	Other topics in nuclear engineering and nuclear power studies	4823
1400	PROPERTIES OF SPECIFIC PARTICLES AND RESONANCES	4791	2900	EXPERIMENTAL METHODS AND INSTRUMENTATION FOR	
1420	Baryons and baryon resonances	4791		ELEMENTARY-PARTICLE AND NUCLEAR	
1440	Mesons and meson resonances	4792		PHYSICS	4823
1460	Leptons	4792	2910	Preacceleration (injection)	—
1480	Other and hypothetical particles	4792	2915	Electrostatic and linear particle accelerators	4823
			2920	Cyclic accelerators and storage facilities	4824
2000	NUCLEAR PHYSICS	4792	2925	Particle sources and targets, preparation and technology	4825
2100	NUCLEAR STRUCTURE	4792	2930	Radiation spectrometers and spectroscopic techniques	4827
2110	General and average properties of nuclei; properties of nuclear energy levels	4792	2940	Radiation detectors	4827
2110D	Binding energy and masses	4793	2960	Counting circuits and nuclear electronics	4828
2110F	Shape, charge, radius and form factors	4793	2970	Radiation measurement, detection and counting	4829
2110H	Spin, parity, and isobaric spin	4793	2975	Polarization analysis	—
2110J	Spectroscopic factors	4793	2980	Nuclear information processing	—
2110K	Electromagnetic moments	4793	2990	Other topics in high-energy and nuclear experimental methods and instrumentation	4829
2110M	Level density and structure	4793			
2130	Nuclear forces	4794	3000	ATOMIC AND MOLECULAR PHYSICS	4829
2140	Few-nucleon systems	4794			
2160	Nuclear-structure models and methods	4794	3100	THEORY OF ATOMS AND MOLECULES	4829
2160C	Shell model	4794	3110	General theory of structure, transitions and chemical binding	4829
2160E	Collective models	4795	3115	General mathematical and computational developments	4830
2160F	Models based on group theory	4795	3120	Specific calculations and results	4830
2160G	Cluster models	4795	3120D	Complete ab initio calculations (exact or nearly exact calculations on small species)	—
2160J	Hartree-Fock and random-phase approximations	4795	3120E	Ab initio LCAO and GO SCF calculations	4831
2165	Nuclear matter	4795	3120G	Other accurate, or nearly ab initio calculations (DIM method, SAMO method, etc.)	4831
2180	Hypernuclei	4795	3120L	Statistical model calculations (Thomas-Fermi and Thomas-Fermi-Dirac models)	—
2190	Other topics in nuclear structure	—	3120N	Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCIO methods, etc.)	4832
2300	RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS	4796			
2320	Electromagnetic transitions	4796			
2320C	Lifetimes and transition probabilities	4796			
2320N	Internal conversion and extranuclear effects	—			
2340	beta decay; electron and muon capture	4796			

	page		page
3120P	Other semi-empirical calculations (Hückel, generalized Hückel, PPP methods, etc.)	4832	3500 PROPERTIES OF ATOMS AND MOLECULES; INSTRUMENTS AND TECHNIQUES
3120R	Valence bond calculations (ab initio or not)	—	3510 Atoms
3120T	Electron correlation and CI calculations	4832	3510B Atomic masses, mass spectra, abundances, and isotopes
3120W	Empirical methods (nonquantum methods for conformations, as Wiberg method, Westheimer method, etc.)	—	3510D Electric and magnetic moments, polarizability
3130	Corrections to electronic structure	4833	3510F Relativistic corrections, fine- and hyperfine-structure constants
3150	Excited states	4834	3510H Ionization potentials, electron affinities
3170	Effects of molecular interactions on electronic structure	4835	3510W Weak interactions
3170D	Environmental and solvent effects	4835	3520 Molecules
3170F	Potential-energy surfaces for collisions	4835	3520B General molecular conformation and symmetry; stereochemistry
3170H	Time-dependent phenomena: excitation and relaxation processes, and reaction rates	4835	3520D Interatomic distances and angles
3170K	Molecular solids	4836	3520G Bond strengths, dissociation energies, hydrogen bonding, etc.
3190	Other topics in the theory of atoms and molecules	4836	3520J Barrier heights (internal rotation, inversion); rotational isomerism, conformational dynamics
3200	ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS	4836	3520M Electric and magnetic moments (and derivatives), polarizability, and magnetic susceptibility
3220	Atomic spectra grouped by wavelength ranges	4836	3520P Rotation, vibration, and vibration-rotation constants
3220B	Radiofrequency, microwave, and infrared spectra	4836	3520S Hyperfine and fine-structure constants
3220J	Visible and ultraviolet spectra	4836	3520V Ionization potentials, electron affinities, molecular core binding energy
3220R	X-ray spectra	4836	3520W Weak interactions
3250	Fluorescence, phosphorescence	4837	3520X Mass spectra
3260	Zeeman and Stark effects	4837	3520Y Correlation times in molecular dynamics
3270	Spectral line shapes and intensities	4837	3580 Atomic and molecular measurements and techniques
3280	Photon interactions with atoms	4838	
3280B	Level crossing and optical pumping	4838	
3280D	Autoionization	4839	
3280F	Photoionization and photodetachment	4839	
3280H	Auger effect and inner-shell ionization	—	
3280K	Multiphoton processes	4839	
3290	Other topics in atomic spectra and interactions with photons	4840	
3300	MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS	4840	4000 CLASSICAL AREAS OF PHENOMENOLOGY
3310	Calculation of molecular spectra	4840	
3320	Molecular spectra grouped by wavelength ranges	4841	4100 ELECTRICITY AND MAGNETISM; FIELDS AND CHARGED PARTICLES
3320B	Radiofrequency and microwave spectra	4842	4110 Classical electromagnetism
3320E	Infrared spectra	4842	4110D Electrostatics, magnetostatics
3320F	Raman and Rayleigh spectra	4843	4110F Steady-state electromagnetic fields; electromagnetic induction
3320K	Visible spectra	4844	4110H Electromagnetic waves: theory
3320L	Ultraviolet spectra	4845	4170 Particles in electromagnetic fields: classical aspects
3320N	Vacuum ultraviolet spectra	4845	4180 Particle beams and particle optics
3320R	X-ray spectra	4845	4180D Electron beams and electron optics
3325	Nuclear magnetic resonance and relaxation; nuclear quadrupole resonance (NQR)	4845	4180G Ion beams and ion optics
3330	Electron paramagnetic resonance and relaxation	4846	4190 Other topics in electricity and magnetism
3335	Double resonances and other multiple resonances	4847	
3335H	MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)	4847	4200 OPTICS
3340	Mössbauer spectra	4847	4210 Propagation and transmission in homogeneous media
3345	Magneto-optical and electro-optical spectra; dichroism	4847	4220 Propagation and transmission in inhomogeneous media
3345B	Zeeman and Stark effects	4848	4230 Optical information, image formation and analysis
3345C	Magnetic circular dichroism	4848	4240 Holography
3350	Fluorescence, phosphorescence; radiationless transitions (intersystem crossing, internal conversion)	4848	4250 Quantum optics
3365	Photoelectron spectra	4852	4252 Masers
3370	Intensities and shapes of molecular spectral lines and bands	4853	4255 Lasing processes
3380	Photon interactions with molecules	4853	4255B General theory of lasing action
3380B	Level crossing and optical pumping	4853	4255D CO ₂ lasers
3380E	Autoionization, photoionization, and photodetachment	4854	4255F Inert gas lasers
3380G	Diffuse spectra; predissociation, photodissociation	4854	4255H Lasing action in other gas lasers
3380K	Multiphoton processes	4856	4255K Chemical lasers
3390	Other topics in molecular spectra and interactions with photons	4856	4255M Lasing action in liquids and organic dyes
3400	ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS	4856	4255P Lasing action in semiconductors with junctions
3410	General theories and models	4856	4255R Lasing action in other solids
3420	Interatomic and intermolecular potentials and forces	4857	4255T Free electron lasers
3440	Elastic scattering of atoms and molecules	4857	4260 Laser systems and laser beam applications
3450	Inelastic scattering of atoms and molecules	4859	4260B Design of specific laser systems
3450E	Rotational and vibrational energy transfer	4861	4260D Laser resonators and cavities
3450H	Electronic excitation and ionization (inc. beam-foil excitation and ionization)	4861	4260F Laser beam modulation
3450L	Chemical reactions, energy disposal, and angular distribution, as studied by atomic and molecular beams	4863	4260H Optical problems related to properties and interactions of laser beams
3470	Charge transfer	4863	4260K Optical problems related to applications of laser beams
3480	Electron scattering	4864	4265 Nonlinear optics
3480B	Elastic scattering of electrons by atoms and molecules	4864	4265B General theory
3480D	Atomic excitation and ionization by electron impact	4865	4265C Stimulated Raman, Brillouin and Rayleigh scattering; parametric oscillations and harmonic generation
3480G	Molecular excitation, ionization, and dissociation by electron impact	4866	4265F Phase conjugation
3490	Other topics in atomic and molecular collision processes and interactions	—	4265G Photon echoes, self-induced transparency, optical saturation and related effects

SUBSIDIARY INDEXES

SUBJECT GUIDE

The SUBJECT GUIDE is an alphabetical index to subjects covered in the classification scheme, by which the abstracts are arranged. The numbers given are classification codes. The CLASSIFICATION AND CONTENTS, which precede the Guide, gives the page number for each section.

	Classification		Classification		Classification
A mesons	1440	Atomic polarisability	3510D	Boson systems	0530
Ab initio calculations	3120	Atomic spectra	32	Boundary layer flow	4715C, 4725F
Aberrations	4180, 4230, 4278	Atomic structure	31, 3510	Boundary layer turbulence	4725F
Abrasion	4630P, 6220P, 8140P	Atomic transitions	3110	Brain	87
Absorptive models	1240P	Atoms	30	Bremsstrahlung	0350, 41, 7870
Acceleration measurement	0630G	Audition	8734	Brillouin spectra	3320F, 4265C, 5170, 7835
Accumulation layers	7320, 7340Q	Auger effect	3280H, 7920F, 7920N, 7960, 8260	Brillouin zones	6320, 7125
Acoustic devices	4385	Aurora	9410S	Brink model	2160G
Acoustic holography	4363	Autoionisation	3280D, 3380E	Brittleness	4630N, 6220M, 8140N
Acoustic noise	4350, 4360, 4388, 8670J	Axial vector currents	1140	Brownian motion	0540
Acoustic nuclear magnetic resonance	7660	Axiomatic field theory	1110	Bubble chambers	2940
Acoustic paramagnetic resonance	7630			Buckling	4630L, 6220F, 8140L
Acoustic properties of gases	5140				
Acoustic properties of liquids	6260				
Acoustic properties of solids	6265				
Acoustic signal processing	4360				
Acoustic wave propagation	4320, 4325, 5140, 6260, 6265				
Acoustics	43	B mesons	1440	C invariance	1130
Acousto-optical effects	5140, 5170, 7820H	Background radiation	9870V	Calibration	0620H
Acoustoelectric effects	4388, 5140, 5150, 7250	Band model of magnetism	7510L	Calorimetry	0720F
Adaptive optics	42	Band structure	7125	Cameras	0768
Adherence	4630P	Barkhausen effect	7560E	Capillarity	6810
Adhesion	4630P, 6825, 8190	Barrier heights	3520J	Carbon dioxide lasers	4255D, 4260
Adsorption	6845, 8265	Baryon-baryon interactions	1375C, 1375E, 1385	Cardiology	87
Aerodynamics	4740	Baryon-baryon scattering	1375C, 1375E, 1385	Carrier density	7220
Aeroelasticity	4630C, 4630M	Baryon decays	1330	Carrier lifetime	7220J
Aeronomy	94	Baryon electric moment	1340F, 1420	Carrier mobility	7220
Aerosols	4755K, 8270, 92	Baryon-kaon interactions	1375J, 1385	Casting	8120, 8130F
Aerospace	9480, 9555	Baryon-kaon scattering	1375J, 1385	Catalogues	9585
Aerospace biophysics	8765	Baryon magnetic moment	1340F, 1420	Cathodochromism	7820
Ageing	8140G	Baryon mass	1420	Cathodoluminescence	7860H
Airglow	9410Q	Baryon parity	1420	Cavitation	4755B
Algebra	0210	Baryon-pion interactions	1375G, 1385	Celestial mechanics	0320, 9510C
Alpha decay	2360	Baryon-pion scattering	1375G, 1385	Cells (electric)	8630D
Alpha particle-nucleus reactions	2560	Baryon-pion production	1360P, 1365, 1375, 1385	Cellular biophysics	8725
Alpha particle-nucleus scattering	2560	Baryon resonance production	1360P, 1365, 1375, 1385	Ceramic preparation	8120L, 8120N
Alpha particle spectroscopy	2930			Ceramics	81
Alpha particles	2140, 2710	Baryon resonances	1420	Cermets	81
Amorphous semiconductors	6140, 7125M, 7220, 7280N	Baryon spin	1420	CESR	7630P
Amorphous state	6140, 81	Baryons	1420	Chalcogenide glasses	6140D, 7280N
Anderson model	7110, 7125M, 7155	BCS theory	2160, 7420F	Channel flow	4760
Anelasticity	4630J, 6240, 8140J	Beam-foil excitation	3450H	Channelling	6180M
Anemometers	4780, 9385	Beam-foil ionisation	3450H	Chaos	0540
Angular measurement	0630C	Beam handling equipment	2925	Charge density waves	7145, 7215N
Annealing	8140E, 8140G	Beam handling techniques	2925	Charge exchange	3470
Anodisation	8160, 8245	Bending	4630J, 6220F, 8140L	Charge ordered states	7145, 7150
Antiferromagnetism	7530	Beta decay	2340	Charge transfer	3470
Antiferroelectric materials	7780	Beta ray spectroscopy	2930	Charge transfer reactions	8230
Antiferromagnetic properties of substances	75, 7550E	Betatron	2920	Charge transfer states	31, 7170C
Antiferromagnetic resonance	7650	Bethe-Salpeter equations	1110	Charm particles	1420, 1440
Antiphase boundaries	81	Bi-metric gravity theories	0450	Chemical analysis	8280
Antiphase domains	81	Bibliographies	0130T	Chemical binding	3110, 3520G
Antireflection coatings	4270, 4278H, 4280	Binary stars	9780	Chemical energy conversion	8630Q
Appearance potential spectroscopy	0785, 7870E	Binding energy	31, 3520V, 6150L	Chemical energy storage	8640H
APW calculations	7110, 7125C	Bio-optics	8750E, 8760G	Chemical kinetics	8220
Architectural acoustics	4355	Bioacoustics	8738, 8750B, 8750C, 8760B	Chemical lasers	4255K, 4260, 8240
Artificial limbs	8770J	Biocommunications	87	Chemical reactions	3450L, 8230, 8235, 8240
Artificial organs	8770J	Biocontrol	8710	Chemical shifts	3325, 7660C
Association	6120, 6125, 8230	Biocybernetics	8710	Chemical thermodynamics	8260
Asteroids	9630H	Bioelectric phenomena	8730, 8732E	Chemical vapour deposition	6855, 8115H
Astroarchaeology	9590	Bioenergy conversion	8630Z	Chemiluminescence	5170, 7860P, 8240
Astrometry	95, 9555	Biography	0150	Chemioception	8738
Astronomical instruments	95	Biological effects of radiation	8750	Chemisorption	6845, 8265
Astronomy and astrophysics	95, 96, 97, 98	Biological fluid dynamics	8745	Cherenkov detectors	2940
Atlases	9585	Biological techniques and instruments	8780	Cherenkov radiation	41
Atmospheric acoustics	4328	Biology	87	Chiral symmetries	1130

59523 Plutonium recycling scenario in light water reactors. Assessment of the environmental impact in the European Community. Chur, Switzerland: Harwood Academic Publishers (1982), iv+254 pp. [3 7186 0118 4]

The aim of the report is to make a forward assessment of any additional environmental impact of a conceivable plutonium recycling strategy in some light water nuclear power plants in the light of the possible development of nuclear generating capacity in the European Community at the end of the century. The specific studies initiated are as follows: description of a reference mixed oxide fuel fabrication plant; preliminary design for a plutonium oxide storage unit; environmental radiological impact of plutonium recycling in light water reactors; differential environmental impact of reprocessing spent U/Pu mixed-oxide instead of spent uranium fuel; environmental impact of the conversion of plutonium nitrate arising from the reprocessing of mixed-oxide fuel; environmental impact of plutonium transportation for normal transport conditions; and toxicity of plutonium, americium and curium.

01.30C Conference proceedings

59524 Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting.

Adv. Space Res. (GB), vol.2, no.4 (1982).

Conference held at: Ottawa, Canada. Date 16 May-2 June 1982. The following topics were dealt with: spatial resolution of telescopes in space, IR and submillimetre astronomy techniques and instrumentation, X-ray instruments and missions, far and EUV techniques and instrumentation and solar physics.

59525 Supercritical Fluids. Their Chemistry and Application.

Fluid Phase Equilibria (Netherlands), vol.10, no.2-3 (March 1983).

Conference held at: Cambridge, England. Date 13-15 Sept. 1982. The following topics were dealt with: general theory and predictions of supercritical fluid equilibria; thermophysical properties of supercritical fluids; applications of supercritical fluids including fluid extraction techniques. 21 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

59526 21st Annual Congress of the South African Association for Physicists in Medicine and Biology (papers in summary form only received).

Health Phys. (GB), vol.44, no.3 (March 1983).

Conference held at: Bloemfontein, South Africa. Date 16-18 March 1981. The topics dealt with included: radiation protection past, present and future; criteria for setting a lower limit to radiation dose; in vivo chest measurements used for routine determinations of U contamination; a national calibration service in radiation dosimetry; physical aspects of neutron dosimetry and the neutron response of a photon detector; a new type of recoil spectrometer for neutron energy spectra measurements; existing and future dosimetry standards; calibration of a remotely controlled afterloading system suitable for brachytherapy; the neutron sensitivity of a GM counter; absorbed doses to a tissue equivalent phantom during pantomographic radiology. 19 papers were presented.

59527 2nd Special Symposium on the National Radiation Environment Indian Association for Radiation Protection (papers in summary form only received).

Health Phys. (GB), vol.44, no.3 (March 1983).

Conference held at: Bombay, India. Date 19-23 Jan. 1981. The topics dealt with included: dosimetry analysis of high natural radioactivity areas of the Indian SW coast; Rn and daughter products in man and his environment; α spectroscopic techniques for field measurement of Rn daughters; the electret system and measuring Rn isotopes and decay products in dwellings; natural contamination in radionuclide detection systems; radiation exposure and resulting risk due to residence and employment in a Rn spa; internal exposure of residents in high background areas; natural radioactivity releases from coal fired and geothermal power plants in Italy; lung exposure to Rn daughters. 20 papers were presented.

59528 1982 IEEE Conference on the Application of Accelerators in Research and Industry.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2 (April 1983).

Conference held at: Denton, TX, USA. Date 8-10 Nov. 1982. Sponsors: DOE; NSF; D.A.R.P.A.; Naval Surface Weapons Centre; NBS; et al. The following topics were dealt with: accelerator application in: atomic and molecular physics; energy loss; nuclear physics and astrophysics; CTR and related phenomena; trace analysis with ion beams, surface analysis, microprobes; accelerator technology; detectors and spectrometers; accelerator targets; radiological safety aspects, activation and bulk analysis; radiation processing; mineral exploration and geophysics; computed tomography; ion implantation, semiconductors, materials modifications, channeling, sputtering; medical applications, radiotherapy, image applications, radioisotope production. 257 papers were presented, of which 246 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

59529 Proceedings of the Meeting held by The Astronomical Science Group of Ireland.

Irish Astron. J., vol.15, no.3 (March 1982), [received: April 1983]

Conference held at: Cork, Ireland. Date 22 May 1981. The following topics were dealt with: evolved H II region M16, IR, gamma rays, Cygnus X-3, image intensifiers, R81, P Cygni star, Large Magellanic Cloud, Irish early astronomy.

59530 Proceedings of the Third International Workshop on Railway and Tracked Transit System Noise.

J. Sound & Vib. (GB), vol.87, no.2 (22 March 1983).

Conference held at: Monument, CO, USA. Date 8-10 April 1981. The following topics were dealt with: sources and mechanisms of wheel/rail noise; means for control of wheel/rail noise; other sources of railway noise; elevated structure noise; propagation of railway noise; community response to railway noise; and ground vibration from railway operations. 29 papers were presented, all of which are published in full in the present proceedings.

59531 Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences.

J. Stat. Phys. (USA), vol.30, no.2 (Feb. 1983).

Conference held at: Gaithersburg, MD, USA. Date 28 June-1 July 1982. The following topics were dealt with: continuous time random walks from classical dynamics; reaction-diffusion processes; fractal and lacunary stochastic processes; nonexponential decay in relaxation phenomena; exciton motion; relaxation, capture and annihilation; renormalization group approach; hopping and multiple-trapping transport; excitation trapping; diffusion; random walks on inhomogeneous lattices; diffusion-controlled reactions among stationary sinks; stochastic biological locomotion; ligand migration in biomolecules; protein folding; self-avoiding walks; polymers excluded volume; Monte Carlo renormalisation group calculations for polymers; Pearson's random walk; vacancy mechanism in crystals; energy transfer as a random walk; diffusion in concentrated lattice gases; deterministic microscopic dynamics; random walks of dislocations; adsorption kinetics on stepped surfaces; and equilibrium folding pathways for model proteins. 44 papers were presented, of which 29 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

59532 Proceedings of the Third International Conference on 'Vibrations at Surfaces'.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29 (15 Jan. 1983).

Conference held at: Asilomar, CA, USA. Date 1-4 Sept. 1982. The topics chosen for the eight sessions held over a span of 3 days were: (I) vibrational frequency shifts and width-lateral interactions; (II) dynamical processes at surfaces; (III) and (IV) electron loss spectroscopy; (V) Raman and surface enhanced Raman scattering; (VI) infrared absorption and reflection spectroscopy; (VII) beam surface scattering—surface phonons; (VIII) electron tunnelling spectroscopy—surface enhanced Raman studies in electrochemistry. In addition, C.B. Duke presented an introductory keynote surveying progress in the field since the last meeting. In the final session H. Ibach and T. Grimley presented conference overviews and future prospects for the field from an experimental and theoretical perspective. Approximately 102 papers were presented in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

59533 RAS Specialist Discussion on Astrophysical Applications of Accretion Disks (Papers in summary form only received).

Observatory (GB), vol.103, no.1053 (April 1983).

Conference held at: London, England. Date 8 Oct. 1982. The following topics were dealt with: accretion discs in regions of star formation; protoplanetary discs; accretion-disc coronae; disc eruptions in cataclysmic variable stars; jets and the giant binary star R Aquarii; alpha-beta accretion discs; the theory of thick accretion discs; and accretion discs in galactic nuclei. 8-papers were presented, of which all are published as abstracts only.

59534 Proceedings of the First International Conference on 'Radiation Effects in Insulators'.

Radiat. Eff. (GB), vol.65, no.1-4 (1982).

Conference held at: Arco, Largo di Garda, Italy. Date 1981. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

59535 Radiation and the Worker - Where do we go from Here?.

Radiol. Prot. Bull. (GB), no.51, suppl. (March 1983).

Conference held at: London, England. Date 7 Jan. 1983. The following topics were dealt with: scientific and administrative bases of radiological protection; radiation and the law; radiation protection and the unions; radiation protection and the employer. Four papers were presented, all of which are published in the present proceedings as abstracts only.

59536 OFC '83. Sixth Topical Meeting on Optical Fiber Communication (papers in summary form only received).

New York, USA: IEEE (1983), 108 pp.

Conference held at: New Orleans, LA, USA. Date 28 Feb.-2 March 1983. The following topics were dealt with: optical fibre telecommunications; non-oxide fibre materials; undersea systems; fibre design; passive optical components; fibre splicing; cables; single-mode fibres; polarisation; chemical studies; sensors; sources; detectors; transmitters; receivers; fibre strength; fibre drawing; system technology; diode laser noise; telecommunication systems; lightwave systems; fibre fabrication; distribution; local networks; local loop applications; nonlinear optics; radiation effects; and military applications.

59537 Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028).

Oak Ridge, TN, USA: Oak Ridge Nat. Lab. (1982), ix+502 pp.

Conference held at: Arlington, VA, USA. Date 16-17 June 1982. Sponsors: U.S. Nucl. Regul. Comm.; Oak Ridge Nat. Lab. The following topics were dealt with: low level nuclear waste disposal; geological site characterisation; geomechanical properties; hydrologic characterisation; groundwater investigation; surface water quality; air quality; meteorological measurements. 19 papers were presented, all of which are published in full in the present proceedings.

ings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

59538 Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering.

Amsterdam, Netherlands: Elsevier (1982), xii+654 pp. [0 444 42122 X]
Conference held at: Portoroz, Yugoslavia. Date 7-10 Sept. 1981. The following topics were dealt with: sintering, theory and kinetics, solid state sintering, liquid phase sintering, activated sintering, hot pressing, powder metallurgy, ceramics sintering, surface energy, solid solution additives, reactive sintering, interfacial segregation, shrinkage, grain growth, densification, sol-gel processes, diffusion during sintering, dimensional changes, grain boundaries, electronic structure, magnetic properties, mechanical properties and electrical properties of sintered materials, geometrical aspects, computer simulation, and sintering of garnets and semiconductors. 86 papers were presented of which all are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

59539 Topics in Ocean Physics. Proceedings of the International School of Physics, 'Enrico Fermi', Course LXXX.

Amsterdam, Netherlands: North-Holland (1982), xvi+554 pp. [0 444 86160 2]
Conference held at: Varenna, Italy. Date 7-19 July 1980. The following topics were dealt with: (1) the dynamics of mesoscale and large-scale flows, (2) nonlinear wave mechanics, (3) mixed-layer physics, and, (4) linear models of ocean surface waves. 21 papers were presented.

59540 Exploration of the Polar Upper Atmosphere. Proceedings of the NATO Advanced Study Institute.

Reidel: Dordrecht, Netherlands (1981), xvi+498 pp. [90 277 1225 5]
Conference held at: Lillehammer, Norway. Date 5-16 May 1980. The following topics were dealt with: the neutral polar atmosphere above the tropopause, the polar ionosphere, optical remote sensing of the polar atmosphere and ionosphere, solar-magnetosphere-polar atmosphere interactions, electric fields and currents at high latitudes, waves and particles in the polar regions, historical exploration of the polar upper atmosphere and applications of polar upper atmosphere research.

59541 Earthquake Prediction. An International Review. Symposium on Earthquake Prediction.

Washington, DC, USA: American Geophys. Union (1981), viii+680 pp. [0 87590 403 3]

Conference held at: Mohonk, NY, USA. Date 12-16 May 1980. The following topics were dealt with: seismicity patterns, recurrence times along major fault zones, seismic precursors and nonseismic precursors, models, laboratory investigations and national programs.

59542 Reevaluations of Dosimetric Factors, Hiroshima and Nagasaki. Proceedings of a Symposium.

Oak Ridge, TN, USA: U.S. Dept. Energy (1982), x+296 pp. [0 87079 398 5]

Conference held at: Germantown, MD, USA. Date 15-16 Sept. 1981. Sponsors: Office Health Environ. Res.; Office Energy Res.; U.S. Dept. Energy. This volume is the result of recent research which indicates that significant revisions may have to be made in the estimates of radiation doses to survivors of the atomic bombs at Hiroshima and Nagasaki. Studies of health effects among these survivors and their correlation with the doses estimated in the late 1950s and early 1960s have provided a fundamental data base for estimating radiation risk. Because of the profound implications of any substantial modifications of the estimated neutron and gamma doses in the two cities, this book explores the current status of research and assesses future directions and priorities. The thirteen papers provide a comprehensive discussion of the many factors that affect the dose estimates, including weapon yields, prompt and delayed neutron and gamma source terms, air transport, and structure and body shielding. Taken as a whole, the volume contains detailed information on the historical perspective, recent developments (notably in significant improvements in source terms and air-transport calculations), and plans for future research efforts.

59543 Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop.

Berlin, Germany: Springer-Verlag (1982), viii+337 pp. [3 540 11956 6]

Conference held at: Marseille, France. Date 29 June-4 July 1981. The following topics were dealt with: relations of the theory of diffusion processes, jump processes, and random fields with nonrelativistic quantum mechanics, stochastic mechanics, quantum field theory, and gauge field theory; stochastic processes in solid state physics and in equilibrium and nonequilibrium classical and quantum statistical mechanics, noncommutative stochastic processes, stochasticity in classical dynamical systems, and stochastic processes in acoustics and music. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

01.30E Monographs, and collections

59544 Paleoreconstruction of the continents. M.W.McElhinny, D.A.Valencia [Ed.]

Washington, DC, USA: American Geophysical Union (1981), 194 pp.

The following topics were dealt with: continental fitting, palynology, palaeogeography, palaeoclimatology, glaciation, marine magnetic anomalies, Arctic seafloor structure, and palaeomagnetic studies of: Africa and Madagascar, Australia and Antarctica, India, South America, Japanese islands, southeast and east Asia, northern Europe, southern Europe and Middle East, North America, and the Soviet Union.

59545 Tectonic and geologic evolution of southeast asian seas and islands. D.E.Hayes [Ed.]

Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

The following topics were dealt with: the tectonic and geological evolution of the Philippines and adjacent seas; the spatial distribution of earthquakes and subducted lithosphere in the Philippine and northeastern Indonesian islands; Eocene oceanic crust in the Celebes Basin; marine magnetic anomalies in the western Philippine Sea; the Central Basin Fault of the West Philippine Basin; the tectonic evolution of the South China Basin; Quaternary sedimentation in the South China Basin; Recent volcanism in the central Philippines; the Sunda Arc and the Molucca Sea; variations in geological structure along the Sunda fore arc; the Molucca Sea collision zone; the lower trench slope off Nias Island in the Sunda Arc; crustal structure across the Mariana island arc; faulting in the Mariana fore arc; palaeomagnetism of Tuk Island and Saipan; volcanic rocks of the Philippine Sea; primitive arc volcanism and a boninite series; back arc spreading and arc volcanism in the Philippine Sea; a palaeomagnetic synthesis for southeast Asia; and heat flow in the east and southeast Asian seas. 18 papers were presented, all of which are published in

full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

59546 Neutron sources. For basic physics and applications. H.H.Barsehall, G.A.Bartholomew, C.B.Bigham, R.C.Bloch, R.M.Brugger, R.E.Chrien, S.Cierjacks, H.Conrads, J.S.Fraser, G.F.Knoll, M.A.Lone, C.A.Uttley, L.Walter, G.B.West, W.L.Whittemore.

Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

This book is the second in the Series on Neutron Physics and Nuclear Data in Science and Technology sponsored by the Nuclear Energy Agency Nuclear Data Committee (NEANDC). The development of neutron sources has advanced tremendously in recent decades and they are now a basic tool for all areas of neutron physics research and nuclear applications. In this book, neutron sources are classified according to the technique by which the neutrons are produced. The corresponding chapters are treated separately by different authors. Each chapter itself gives a more or less independent description for the reader who is interested in a particular category of neutron source. This presentation has led to a certain amount of necessary duplication, but the more generally interested reader will also find numerous cross references between chapters. Each chapter includes a short introduction explaining the source characteristics, a description of the neutron production technique, a thorough discussion of the principal source components and of individual design concepts realized in various laboratories and an illustration of typical source parameters and characteristic applications.

59547 Realism and the aim of science. K.R.Popper.

London, England: Hutchinson (1983), xxxix+420 pp.

In Realism and the Aim of Science, Popper formulates and explains his nonjustificationist theory of knowledge. Science—empirical science—aims at true explanatory theories, yet it can never prove, or finally establish, or justify, any of its theories as true, not even if it is, in fact, a true theory. So science must continue to question and to criticize all its theories, even those which happen to be true. But it can give reasons for preferring some theories to others: some theories are better tested (corroborated), they may raise or solve more problems, they may have greater explanatory power, and they may even be able to correct those (apparent) facts which they were designed to explain. Thus although we do not possess a criterion of truth, we do possess something like a criterion of progress for our theories: of progress towards the truth and towards deeper and more powerful theoretical explanations. Popper replaces the utopian aim of justifying our theories by the realistic aim of submitting them to the severest theoretical and empirical criticism which our ingenuity can devise. Testing a theory consists not only in observing, but in ingenious attempts to find out its weak spots: the spots where the theory may be found wanting, the problems it may be unable to solve.

59548 Research and development on radioactive waste management and storage. First annual progress report of the European Community programme 1980-1984.

Chur, Switzerland: Harwood Academic Publishers (1982), 129 pp. [3 7186 0115 X]

This is the first progress report of the European Community's second programme (1980-1984) of research on radioactive waste management and storage (indirect action). It shows the status of the programme on 31 December 1980. The aim of the programme is the joint development and improvement of a management system of radioactive waste produced by the nuclear industry which, at its various stages, ensures the safety and protection of both man and his environment.

59549 Energy reviews. Nuclear power systems. Vol.1. L.A.Melentiev [Ed.]

Chur, Switzerland: Harwood Academic Publishers (1982), ix+334 pp. [3 7186 0071 4]

This volume, the first in the 'Energy Reviews' section of this series, is devoted primarily to the development and operation of the electrical power system in the Soviet Union. The collection begins with an outline of energy trends in the USSR and presents the reasons for the impending fundamental change in the fuel based for electrical power plants in the European regions of the USSR. It was also considered important to have special articles on the following topics: prospects for using new methods of producing electrical power and the development of district heating in the Soviet Union. Another of the papers was prompted by the widespread use in the USSR of mathematical models for designing and managing electrical power systems.

59550 Cellules solaires constitues de couches minces de CdTe polycristallines (Solar cells made from polycrystalline CdTe thin films). Y.Marfaing.

Report EUR 8154 EN-FR, Comm. European Communities, Luxembourg (1982), 75 pp. Contract 206-76 ESF.

The following topics were dealt with: minority carrier diffusion lengths; theoretical and experimental analyses; p-n homojunction characteristics.

01.30M Textbooks for graduates and researchers

59551 Relativistic astrophysics. M.Demianski.

Oxford, England: Pergamon (1981), 300 pp. [0 08 025042 4]

Discusses gravitational fields, relativistic thermodynamics and hydrodynamics, stellar equilibrium and stability in general relativity, rotating stars, neutron stars, pulsars, gravitational collapse and black holes, gravitational waves and cosmology.

59552 Channels of Mars. V.R.Baker.

Bristol, England: Adam Hilger (1982), xiii+198 pp. [0 85274 467 6]

Discusses telescopes, canals and space probes, morphology, channel types and age and distribution, origin, valley patterns and networks, ice, outflow channels, channelled scabland, Earth analogue, catastrophic floods and water.

59553 Superconductivity in ternary compounds. II. Superconductivity and magnetism. M.B.Maple, O.Fischer [Ed.]

Berlin, Germany: Springer-Verlag (1982), xvi+306 pp. [3 540 11814 4]

Considers the problems of the coexistence of superconductivity and magnetism. The topics covered include: the critical fields and critical currents of ternary molybdenum chalcogenides; the superconductivity and magnetism in rare earth rhodium borides and rare earth transition metal stannides; NMR and Mossbauer effect measurements in ternary compounds and the neutron scattering measurements of magnetic ordering in ternary superconductors.

59554 Analysis, manifolds and physics. Revised edition. Y.Choquet-Bruhat, C.DeWitt-Morette, M.Dillard-Bleick.

Amsterdam, Netherlands: North-Holland (1982), xx+630 pp. [0 444 86017 7]

A theoretical physicist needs to be able to use nearly all branches of mathematics and to use them reliably. The authors have written this book to make contemporary mathematics accessible and useful to the physicist. For this reason, the book covers a very large amount of material and brings together several branches of mathematics of interest to physics. It also includes many problems with their solutions. The present edition is a thorough revision of the first. There is a new chapter entitled 'Connections on Principle Fibre

Bundles' which includes sections on holonomy, characteristic classes, invariant curvature integrals and problems on the geometry of gauge fields, monopoles, instantons, spin structure and spin connections. Other additions include a section on the second fundamental form, a section on almost complex and kahlerian manifolds, and a problem on the method of stationary phase. Many paragraphs have been rewritten, and examples and exercises added to ease the study of several chapters. The index has been expanded by more than 150 entries. This reference book, which can also be used as a text, provides an answer to the needs of graduate physical mathematics students and their teachers.

59555 Adsorption on metal surfaces. An integrated approach. J.Benard [Ed.] Y.Berthier, F.Delamare, E.Hondros, M.Huber, P.Marcus, A.Masson, J.Oudar, G.E.Rhead.

Amsterdam, Netherlands: Elsevier (1983), x+338 pp. [0 444 42163 7]
This book makes no claim to be an exhaustive review of the research which has been done on adsorption on metals. The abundance and diversity of this research would have made such a task difficult and probably of limited interest. It is, rather, an attempt at an overall view inspired by the constant preoccupation with bringing together the thermodynamic approach with the atomistic approach to surface and interfacial interactions. The authors cover the following topics: the absolute measurement of the concentration of adsorbates on single-crystal faces, the structure interpretation of diffraction patterns, the specific role of surface defects, and finally the role of equilibria which are established under certain conditions between the bulk metal and its surface. The bibliography at the end of each chapter has been limited to those publications in which the authors' opinions have made a really original and significant contribution on either the experimental or the conceptual level.

01.30P Textbooks for undergraduates

59556 Spectral transform and solitons: Tools to solve and investigate nonlinear evolution equations. Vol.1. F.Calogero, A.Degasperis.
Amsterdam, Netherlands: North-Holland (1982), xviii+514 pp. [0 444 86368 0]

This book presents a novel technique to solve and investigate (certain classes of) nonlinear partial differential equations of evolution. The main motives are the solvability by this technique of many nonlinear evolution equations of great applicative and theoretical interest, and the phenomenology associated with the concept of 'solitons', that is closely related with this technique and has major relevance to various fields of application. This broadness of scope, both in pure and in applied mathematics as well as the dynamical stage of development of this field of enquiry exclude the possibility of providing a systematic and complete coverage of the theory and/or its applications in a single book. This volume focusses on one approach, and leaves out any specific treatment of applications. The guiding thread is the analogy of the spectral transform technique for solving nonlinear evolution equations to the Fourier transform method for solving linear PDEs. The presentation is primarily aimed at students who are approaching this subject for the first time; the book is organized so as to be suitable for self-instruction, or as a textbook (possibly also at the undergraduate level). It will be of use also to the expert researcher, who will find, in addition to a thorough treatment of several topics previously only dealt with in scattered papers, some novel results. (466 refs.)

59557 Probabilistic and statistical aspects of quantum theory. A.S.Holevo.
Amsterdam, Netherlands: North-Holland (1982), x+316 pp. [0 444 86333 8]
The book is accessible to a wide circle of readers, both mathematicians and physicists. It has six chapters dealing with the following subjects: statistical models; mathematics of quantum theory; symmetry groups in quantum mechanics; covariant measurements and optimality; Gaussian states, and unbiased measurements.

59558 Elementary statistical thermodynamics. A problems approach. N.O.Smith.
New York, USA: Plenum (1982), xiv+216 pp. [0 306 41205 5]
This text has been designed to provide an introductory treatment of statistical thermodynamics for all students of chemistry: The author presents a thorough and logical account of the foundations and applications of the subject, in clear steps guiding the neophyte to the point where he or she will be able to apply the elementary material to the calculation of thermodynamic properties by statistical methods. The approach used throughout is problem-based, in the belief that to learn a quantitative subject a student must, above all, work numerical problems in it. An abundance of illustrative examples and problems are provided, with many of the problems fully worked out. Coverage includes the subject of probability developed from first principles, the elementary statistical mechanics of systems of distinguishable particles, the Boltzmann distribution law, the statistical basis of entropy, the statistical treatment of systems of nonlocalized particles and of ideal gases, the calculation of the partition functions for the various kinds of energy (developed at length as an example of how thermodynamic functions are computed), and the subject of chemical equilibrium.

01.30R Surveys and tutorial papers; resource letters

59559 Atmospheric pressure waves generated by solar eclipses. C.A.Reddy (Space Phys. Div., Vikram Sarabhai Space Centre, Trivandrum, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.356-69 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

A review of the present state of knowledge about the solar eclipse-induced pressure perturbations in the atmosphere is presented. The results of experimental measurements on the ground-level pressure perturbations during solar eclipses are critically reviewed and compared with theoretical predictions. The Lamb wave hypothesis of Chimonas (1973) is shown to provide a satisfactory explanation for the ground-level pressure perturbations; but more theoretical modelling work is needed to find out the reasons for the low amplitudes or the non-existence of eclipse-induced pressure perturbations during several observations. It is also pointed out that the ionospheric observations on solar eclipse-induced perturbations in the upper atmosphere are inconclusive in relation to the hypothesis that the gravity waves generated in the stratosphere in the wake of the Moon's shadow can generate ionospheric perturbations. It is concluded that further theoretical work and well-planned measurements from a network of observing stations are needed for further elucidation of the relevant questions. (28 refs.)

01.40 EDUCATION

- 59562 Science anxiety and science learning. J.V.Mallow (Dept. of Phys., Loyola Univ., Chicago, IL, USA), S.L.Greenburg. *Phys. Teach. (USA)*, vol.21, no.2, p.95-9 (Feb. 1983). Discusses the origins and nature of science anxiety. The authors describe the Science Anxiety Clinic and outline the techniques used therein, including science skills training and psychological interventions. Finally comments on the connection between science anxiety and cognitive processes in science learning are given. (20 refs.)

01.50 EDUCATIONAL AIDS

- 59563 Classroom Moire demonstrator. B.W.Cotterman, P.D.Heimdahl (Dept. of Mech., US Military Acad., West Point, NY, USA). *Exp. Tech. (USA)*, vol.7, no.1, p.38-9 (Jan. 1983). A simple and inexpensive 10-minute visual demonstration of moire fringe analysis for use in a classroom or a large lecture room is described. The moire demonstrator consists of a 3-ft wide by 4-ft high, $1/4$ -in. thick Plexiglas master grille connected to a wooden frame. The master grille is made from strips of electrical tape. The specimen consists of a clear-plastic garbage bag clamped at the top to the frame and at the bottom to a rigid movable support arm. A light bouncing off the view-graph screen placed behind the demonstrator projects the grilles. (no refs.)
 59564 Plastic concave and convex cylindrical mirrors. B.F.Melton, T.W.Mayes (Univ. of North Carolina, Charlotte, NC, USA), R.P.Lemmon. *Phys. Teach. (USA)*, vol.21, no.2, p.195-9 (Feb. 1983). Concave and convex cylindrical mirrors are used widely in optics experiments for introductory physics laboratories. The authors describe the advantages of using longer focal length concave and convex cylindrical mirrors constructed from sheets of flexible, back-surfaced, mirror acrylic plastic. Suggestions for several student experiments, along with typical experimental results, are also presented. (6 refs.)

01.65 HISTORY OF SCIENCE

- 59565 Recollections of the discovery of the Thomas precessional frequency. L.H.Thomas (Univ. of North Carolina, Raleigh, NC, USA). *AIP Conf. Proc. (USA)*, no.95, p.4-12 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). The author discusses his recollections of early work on the spinning electron and the discovery of the Thomas precessional frequency. (no refs.)
 59566 International Colloquium on the History of Particle Physics. *J. Phys. Colloq. (France)*, vol.43, no.C-8 (Dec. 1982). Conference held at: Paris, France. Date 21-23 July 1982. The following topics were dealt with: cosmic rays, physics with accelerators, strange particles, early cloud chamber expts., ideas and discovery of leptonic property, neutrino physics, Beta decay and the weak interaction, atomic bomb (philosophy), isospin, quantum electrodynamics, chronology of particle physics.

Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

- 59567 The role of cosmic rays in the development of particle physics. C.Peyrou (Div. EP, CERN, Geneva, Switzerland). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/7-67 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). The discoveries of elementary particles in cosmic rays are reviewed. The paper starts with the discovery of the positron in 1932, follows with the discoveries of the light mesons and make an extensive description of the finding of strange particles in cosmic rays. (67 refs.)
 59568 Development of the cosmic ray techniques. B.Rossi (Dept. of Phys., MIT, Cambridge, MA, USA). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/69-99 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). A close relationship exists between the advances of cosmic-ray physics and technical developments. Thus the development of highly sensitive ionization chambers, eventually to become self-recording instruments, was an essential prerequisite of the observations which first suggested, then proved the extraterrestrial origin of the radiation. The invention of the Geiger-Muller counter and of the associated coincidence devices opened the door to the investigation of the physical properties of the local radiation. Also 'c.r. telescopes', made of G.M. counters, discovered the E-W effect, showing that primary c.r. are positively charged particles. The development of cloud-chambers suitable for c.r. observations, and the development of nuclear emulsions were responsible for the discovery of 'new' elementary particles in the local radiation (the positive electron, the μ -meson, the π -meson, the 'strange' particles). New techniques involving the use of very large detector arrays produced important advances in the study of air showers showing that the primary spectrum extends beyond 10^{20} e.v. Finally, the availability of space vehicles, coupled with the development of new suitable detectors made it possible to determine the chemical and isotopic composition of the incident radiation. (25 refs.)
 59569 Early history of physics with accelerators. H.L.Anderson (Los Alamos Nat. Lab., Los Alamos, NM, USA). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/101-62 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). The early history of physics with accelerators is reviewed, with emphasis on three experiments which have had a profound influence on our view of the structure of matter: the Franck-Hertz experiment demonstrating the mechanism of atomic spectra, the Cockcroft-Walton experiment opening practical ways of studying nuclear disintegration, and the discovery of the Δ^{++} isobar of the proton by Fermi and collaborators, revealing structure in the nucleon. Fermi's work is illustrated by pages from his notebooks. (52 refs.)
 59570 Observations on the discovery of the strange particles. G.D.Rochester (Dept. of Phys., Durham Univ., Durham, England). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/169-75 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). Observations on the early history of the discovery of the strange particles, starting in 1940 with the work of L. Janossy and his collaborators on showers of penetrating particles and ending with the confirmation of the Manchester discoveries by C.D. Anderson and his group in Pasadena in 1950. The role of P.M.S. Blackett is emphasised. (11 refs.)
 59571 Early cloud chamber experiments at the Pic-du-Midi. C.C.Butler (Loughborough Univ. of Technol., Loughborough, England). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/177-84 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). The early history of cloud chamber work on strange particles is described. Particular attention is given to the pioneering work of the Manchester group at the Pic-du-Midi in France. The paper concludes with some preliminary remarks on the value of historical studies of the development of main areas of physics. (15 refs.)
 59572 Cosmic rays and particle physics at Berkeley. W.B.Fretter (Univ. of California, Berkeley, CA, USA). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/191-4 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). The author presents a review of work performed at Berkeley using two particular cloud chambers. An explanation of the phenomena observed and the experiments performed with cosmic rays during the years 1935-1960 is also presented. (no refs.)
 59573 Strange particle theory in the cosmic ray period. R.H.Dalitz (Dept. of Theoretical Phys., Oxford, England). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/195-205 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). The author discusses the role of theoretical physicists in strange particle theory during the cosmic ray period. A review of conferences held and theories presented in the development of strange particles is also made. (22 refs.)
 59574 Ideas and nonideas and the discovery of the leptonic property in Rome. O.Piccioni (Dept. of Phys., Univ. of California, San Diego, La Jolla, CA, USA). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/207-13 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). The author presents a summary of his work on muon detection in Rome from 1941. (14 refs.)
 59575 The infancy and youth of neutrino physics: some recollections. B.Pontecorvo (JINR, Dubna, USSR). *J. Phys. Colloq. (France)*, vol.43, no.C-8, p.c8/221-36 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982). The talk is quite subjective in character, and is in no way complete. It is not a chapter of history of particle physics. It is a collection of a few short stories related to neutrino physics. Two of these, about Pauli and Fermi, touch on subjects already covered by a number of physicists, including the author, in connection with the recent neutrino's fiftieth birthday. A story about Majorana's work on Majorana's fermions, which is following, has been covered much less extensively, at least in English. There follow a few recollections, very personal indeed, related to the experimental and theoretical work of the author in proposing and developing the C1-A method of neutrino detection, in establishing the notion of weak processes and in proposing a new type of weak interaction investigations-high energy neutrino experiments. (41 refs.)

59576 Neutrinos to 1960—personal recollections. F.Reines (Dept. of Phys., Univ. of California, Irvine, CA, USA).

J. Phys. Colloq. (France), vol.43, no.C-8, p.C8/237-60 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982).

An account is given of the events which led to the detection of the free neutrino starting from the tentative idea to use a nuclear explosion as the neutrino source to the detailed realization of the experiment at a nuclear reactor. The logical requirement for detection of the neutrino at a point remote from its origin is discussed as are some subsequent developments in experimental neutrino physics. (35 refs.)

59577 Beta decay opens the way to weak interactions. E.Amaldi (Istituto di Fisica, Guglielmo Marconi, Roma, Italy).

J. Phys. Colloq. (France), vol.43, no.C-8, p.C8/261-300 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982).

After a short introduction with some personal recollection, the author summarizes, in Section 2, the main points of Fermi's theory of beta decay and of the neutrino hypothesis first proposed by Pauli. The successive Sections refer to: a few extensions and modifications of this theory (Section 3), various experimental investigations carried out in the 1930s for testing Pauli's hypothesis and Fermi's approach (Section 4), further attempts, refinements and proposals (Section 5) and a few fundamental steps forward such as the discovery of the universality of weak interactions, of parity violation by weak interactions, the 2-component theory of the neutrino and the (V-A) theory of weak interactions (Section 6). Finally Section 7 refers to a few contributions given in the period 1930-1960 to the problem of double beta decay. (103 refs.)

59578 The road to Los Alamos. S.R.Weart (Centre for History of Phys., American Inst. of Phys., New York, NY, USA).

J. Phys. Colloq. (France), vol.43, no.C-8, p.C8/301-21 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982).

A field of science involves not only pure knowledge, but also images in the public mind. By affecting funding and recruitment into the field, these images help to determine its destination in the world of action. The history of nuclear physics offers an example. By 1938 the field was linked with images of 'transmutation', involving not only scientific methods but images of great improvements for health and wealth, and weapons that would bring world peace or doom. The scientists who went to Los Alamos to build atomic bombs did so chiefly because they wanted to defend themselves against the Nazis, just as others were doing with radar and incendiary bombs. Yet they were also responding to fantastic, but accurate, images that were already deeply established in the public mind; without those images there would have been no atomic bombs. (no refs.)

59579 Isospin. N.Kemmer (Univ. of Edinburgh, Edinburgh, Scotland).

J. Phys. Colloq. (France), vol.43, no.C-8, p.C8/359-93 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982).

The history of isospin is described, starting from the introduction by Heisenberg (1932) of the concept (ρ -spin), associated with the idea that proton and neutron are two states of the same entity (later to be called 'nucleon'). It is stressed that from the start Heisenberg had the picture of the transmission of proton-neutron interaction by a charged agent (field) in mind. It is shown that, in contrast, Majorana's modification of Heisenberg's interaction scheme rejected the isospin formalism and moved away from a field picture. The introduction of isospin into field theories of nucleon-nucleon interaction is described: the charge independent extension first of the Fermi (β , ν) field (Kemmer, 1937) and then of the Yukawa field (Kemmer, 1938). A brief account is given of the consolidation of the 'symmetric theory' of the isospin of the nucleon-pion system, following the post-war experimental proof of the existence of the pion isotriplet and the improvement in the understanding of field theories in terms of the renormalisation concept. The application of this iso-invariance of the (N- π) system in the description of a wide range of phenomena (weak interactions) is sketched. The first step into nonabelian gauge theory—the Yang-Mills iso-vector gauge field—is briefly described, concluding with brief remarks on the status of isospin within the framework of modern particle theory. (35 refs.)

59580 Strangeness. M.Gell-Mann (Lauritsen Lab. of Phys., California Inst. of Technol., Pasadena, CA, USA).

J. Phys. Colloq. (France), vol.43, no.C-8, p.C8/395-408 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982).

This paper is not a history of the discovery of the strangeness, but rather a contribution to such a history, consisting of personal reminiscences. The atmosphere and ideas of the period 1951-1953 are described. The author explains the reasons that led him to introduce the concept of the strangeness and how he had to convince people and to overcome oppositions. (11 refs.)

59581 Quantum electrodynamics—an individual view. J.Schwinger (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

J. Phys. Colloq. (France), vol.43, no.C-8, p.C8/409-23 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982).

The aim of this report is to describe the development of the quantum electrodynamics in the years from the 1930s to the 1950s. It is based on the way the author saw and participated to this development. Four phases are discussed: preparation (1934-1946); noncovariant relativistic theory (1947); first covariant relativistic theory (1947-1948); second covariant relativistic theory (1949-50). A detailed technical description is presented. The author shows the influence of quantum electrodynamics in other areas of physics. (54 refs.)

59582 An essay of chronology of particle physics until 1965. J.Six (Lab. de l'Accelérateur Lineaire, Univ. Paris-Sud, Orsay, France), X.Artru.

J. Phys. Colloq. (France), vol.43, no.C-8, p.C8/465-93 (Dec. 1982). (International Colloquium on the History of Particle Physics, Paris, France, 21-23 July 1982).

The main developments in elementary particle physics, from the origins to 1965, are presented in a chronological list with three columns: theories, experimental discoveries and technical means. The work mainly focuses on the period 1930-1965, for which are given the references of the original papers. (165 refs.)

01.75 SCIENCE AND SOCIETY

59583 Radiation hormesis, public health, and public policy: a commentary. R.J.Hickey, E.J.Bowers, R.C.Clelland (Univ. of Pennsylvania, Philadelphia, PA, USA).

Health Phys. (GB), vol.44, no.3, p.207-19 (March 1983).

Public policy affecting public health regarding effects of low-level ionizing radiations has been, and is being, determined by effects estimates based on linear or other monotonic extrapolation from high-level radiation dose-response data to presumed ecologically realistic low-level exposure effects. Such predictive, unmeasured estimates are very possibly in serious error; they are incompatible with observed low-level dose-response data that indicate a negative correlation between low-level radiation data and health effects, such as cancer mortality rates. Observed negative correlations with low-level radiation data are to be expected on the basis of evidence supporting the validity of the hormesis phenomenon. The ignoring of the hormesis phenomenon seems to constitute a very serious error in modern biomedical science and in preventive medicine. A mathematical model is offered that describes the general shape of certain dose-response functions when radiation hormesis at low-level exposure is taken into consideration along with the well-known detrimental effects of high-level radiation. (77 refs.)

02.00 MATHEMATICAL METHODS IN PHYSICS

Analysis, manifolds and physics. Revised edition See Entry 59554

02.10 ALGEBRA, SET THEORY, AND GRAPH THEORY

59584 Cartesian polytensors. J.Applequist (Dept. of Biochem. & Bio-phys., Iowa State University, Ames, IA, USA).

J. Math. Phys. (USA), vol.24, no.4, p.736-41 (April 1983).

A Cartesian polytensor is defined as a set of Cartesian tensors in a sequence of increasing rank. A matrix formulation of polytensors is given to express arrays of direct tensor products and series of tensor contractions in concise form. The transformation of a polytensor under rotation of coordinate axes is shown to be accomplished by means of an orthogonal matrix. The special properties of compressed polytensors, composed of totally symmetric tensors with redundant component deleted, are demonstrated. The use of polytensors is illustrated by an application to the problem of interactions among polarizable electric charge distributions. (7 refs.)

59585 Some character theory for groups of linear and antilinear operators. J.D.Newmarch (Dept. of Phys., Univ. Pertanian Malaysia, Selangor, Malaysia).

J. Math. Phys. (USA), vol.24, no.4, p.742-56 (April 1983).

Elementary group concepts are recast into a form applicable to finite magnetic groups of linear and antilinear operators. Analogs of useful definitions for linear groups such as the Frobenius-Schur invariant, commutator subgroups, and ambivalent classes are considered. These are applied to the 180 magnetic single and double point groups and it is shown that only seven require independent treatment of characters. (37 refs.)

59586 Complementary group with respect to SO(n). G.Couvreux, J.Deenen, C.Quesne (Phys. Theorique et Math., Univ. Libre de Bruxelles, Brussels, Belgium).

J. Math. Phys. (USA), vol.24, no.4, p.779-84 (April 1983).

The authors look for a complementary group with respect to SO(n) within either irreducible representation $\langle \frac{1}{2} \rangle_n$ or $\langle \frac{1}{2} \rangle_{2n-1}^{3/2}$ of the group $Sp(2dn, R)$ of linear canonical transformations in a $2dn$ -dimensional phase space. They prove that (i) such a group is $Sp(2d, R)$ when $n=2q+1$ or $n=2q>2d$; (ii) it is $SU(d, d)$ when $n=2$ and $d>1$; (iii) it does not exist when $n=2$, $d=1$, or $2 < n=2q \leq 2d$. (12 refs.)

59587 Fonction generatrice des facteurs isocscalaires des groupes unitaires (Generating function of isoscalar factors of unitary groups). M.Hage Hassan.

Report LYCEN/8306, Univ. Lyon, France (Feb. 1983), 23 pp. In French.

The author introduces a new schematisation of the elements of the unitary group fundamental representation basis. Using this schematisation as well as two rules which will be established in this work, he finds by an elementary calculus, the generating function of the Gel'fand basis of the unitary group, and the generating function of coupling coefficients. This last generating function allows one to find the one corresponding to SU(n) isoscalar factors. (8 refs.)

02.30 FUNCTION THEORY, ANALYSIS

59588 Continuous and discrete matrix Burgers' hierarchies. D.Levi, O.Ragnisco, M.Bruschini (Istituto di Fisica, Univ. di Roma, Roma, Italy).

Nuovo Cimento B (Italy), vol.74B, ser.2, no.1, p.33-51 (11 March 1983).

The authors derive two hierarchies of matrix nonlinear evolution equations which reduce to the Burgers' hierarchy in the scalar case and can be linearized by a matrix analogue of the Hopf-Cole transformation: for these hierarchies they display the associated class of Backlund transformations and show some special kinds of explicit solutions. Moreover, by exploiting a discrete version of the Hopf-Cole transformation, they are also able to construct

- two hierarchies of linearizable nonlinear difference evolution equations and to derive for them Backlund transformations and explicit solutions. (9 refs.)

03.30 SPECIAL RELATIVITY

- 59590 A special relativistic heat engine. W.S.Cariens. *Int. J. Math. & Math. Sci. (India)*, vol.6, no.1, p.193-6 (1983).
Using the concepts of a heat engine from classical thermodynamics and $E=MC^2$ from special relativity, the author constructs a relativistic heat engine. Central to its functioning is the rest mass increase which results from heating a mass; this in turn will increase both its internal energy and its macroscopic kinetic energy. The engine's operation is as follows; a mass is accelerated to a high speed, heat is added from a comoving reservoir to increase its kinetic energy, the new 'heavier' mass is slowed down to its initial speed, and finally it is cooled to repeat the cycle. More work is seen to be produced during deceleration than was absorbed in acceleration. The efficiency of the engine is derived, and seen to be analogous to the corresponding Carnot equation. (5 refs.)
59591 Questions on universal constants and four-dimensional symmetry from a broad viewpoint. I. J.P.Hsu (Space Sci. Lab., NASA/Marshall Space Flight Center, Huntsville, AL, USA). *Nuovo Cimento B (Italy)*, vol.74B, ser.2, no.1, p.67-80 (11 March 1983).
It is demonstrated that there is a flexibility in clock synchronizations and that the four-dimensional symmetry framework can be viewed broadly. A new viewpoint of the four-dimensional framework is discussed on the basis of a common time for all observers who may be in motion relative to each other. Such a common time can be realized by a special method of clock synchronization and it is not absolute in the Newtonian sense. The author suggests that the truly universal constants in physics are $J=0.35 \times 10^{-37}$ g cm and $\bar{e}=1.6 \times 10^{-20}$ e.m.u. rather than \hbar , e (in e.s.u.) and the speed of light because J and \bar{e} are independent of a special arrangement of the measuring apparatus—such as clock synchronizations. (13 refs.)
59592 Are classical tachyons slower-than-light quantum particles?. E.Recamì, G.D.Maccarrone. *Report INFN/AE-83/1*, Ist. Naz. Fis. Nucl., Catania, Italy (4 Jan. 1983), 9 pp.
After having studied the shape that a tachyon T (e.g., intrinsically spherical) would take up, the authors show in an explicit example that the characteristics of classical tachyons are similar to those of the ordinary (slower-than-light) quantum particles. In particular, a realistic tachyon is associated with a 'phase-speed' V ($V^2 > c^2$), but with a 'group-speed' $v=c^2/V$ ($v^2 < c^2$). (13 refs.)

59593 Finite element, boundary element and coupled analysis of unbounded problems in elastostatics. G.Beer (Dept. of Civil Engng., Univ. of Queensland, Queensland, Australia).

Int. J. Numer. Methods Eng. (GB), vol.19, no.4, p.567-80 (April 1983).

The implementation of a combined boundary element-finite element analysis capability is discussed. A comparison is then made between the finite element, boundary element and coupled method as applied to unbounded problems in elasticity and plasticity. (19 refs.)

59594 Geometrically nonlinear formulation for the curved shell elements.

K.S.Surana (McDonnell Douglas Automation Co., Saint Louis, MO, USA).

Int. J. Numer. Methods Eng. (GB), vol.19, no.4, p.581-615 (April 1983).

Presents a geometrically nonlinear formulation using total lagrangian approach for the three-dimensional curved shell elements. The basic element geometry is constructed using the coordinates of the middle surface nodes and the mid-surface nodal point normals. The element displacement field is described using three translations of the mid-surface nodes and the two rotations about the local axes. The existing shell element formulations are restricted to small nodal rotations between two successive load increments. The element formulation presented here removes such restrictions. This is accomplished by retaining nonlinear nodal rotation terms in the definition of the displacement field and the consistent derivation of the element properties. The formulation presented here is very general and yet can be made specific by selecting proper nonlinear functions representing the effects of nodal rotations. The element properties are derived and presented in detail. Numerical examples are also presented to demonstrate the behaviour and the accuracy of the elements. (26 refs.)

59595 A decreasing property of solutions of parabolic equations with applications to thermoelasticity. W.A.Day (Hertford College, Univ. of Oxford, Oxford, England).

Q. Appl. Math. (USA), vol.40, no.4, p.468-75 (Jan. 1983).

The object of this paper is to establish a decreasing property of solutions of parabolic equations which satisfy boundary conditions of a somewhat unusual kind. The author begins by illustrating, with the aid of two examples from the quasi-static theory of thermoelasticity, how such problems can arise. The coupled partial differential equations are first considered which describe the behaviour of a slab made of homogeneous and isotropic material. (7 refs.)

59596 On the Burnett and higher order equations of hydrodynamics.

L.S.Garcia-Colin (Dept. of Phys., Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).

Physica A (Netherlands), vol.118A, no.1-3, p.341-9 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Several derivations of the Burnett and high order in the gradients equation of classical hydrodynamics are critically examined. It is clearly pointed out that the two available phenomenological derivations and Grad's (1958) kinetic derivation are compatible with the local equilibrium assumption and the entropy balance equation. Furthermore, the failure to fulfil these requirements when such equations are obtained from the Chapman-Enskog method for solving Boltzmann's equations is accounted for. A comparison with other more microscopic methods to obtain these equations is also provided. (20 refs.)

59597 Inverse problem for the reduced wave equation with fixed incident field. III. V.H.Weston (Dept. of Math., Purdue Univ., West Lafayette, IN, USA).

J. Math. Phys. (USA), vol.24, no.4, p.828-33 (April 1983).

For pt.II see *ibid.*, vol.22, p.2523 (1981). The inverse problem for the reduced wave equation $\Delta u + k^2 n^2(x)u = 0$, $x \in R^2$, is examined for the case where measurements of the amplitude of the scattered field (produced by a fixed incident field at a single frequency) are obtained at a finite number of points. A strategy is given for the recovering of the phase data through the minimization of a quadratic form involving comparison data. The problem is then reduced to the problem treated in previous papers where the complex-valued quantities $u^*(x_i)$ are known at a finite number of points. A relationship between the smallest eigenvalue of the 'measurement' matrix and $\|k\|_2$ is given. (4 refs.)

59598 On signal velocity for anomalous dispersive waves. F.Mainardi

(Dipartimento di Matematica, Univ. di Bologna, Bologna, Italy).

Nuovo Cimento B (Italy), vol.74B, ser.2, no.1, p.52-8 (11 March 1983).

The concept of signal velocity for dispersive waves is usually identified with that of group velocity. When the dispersion is anomalous, this interpretation is not correct since the group velocity can assume nonphysical values. In this note, by using the steepest-descent method first introduced by Brillouin (1960), the phase velocity is shown to be the signal velocity when the dispersion is anomalous in the full range of frequencies. (8 refs.)

59599 Travelling waves in a dielectric slab with an abrupt change in thickness. F.G.Leppington (Dept. of Math., Imperial Coll., London, England).

Proc. R. Soc. London Ser. A (GB), vol.386, no.1791, p.443-60 (8 April 1983).

If a slab (or tube) of dielectric material of uniform thickness is surrounded by a medium of lower dielectric constant it can support travelling waves that propagate without attenuation. If there is an abrupt change in the slab thickness, reflection and radiation will occur. The author considers the simplest prototype case, in which a transverse magnetic travelling wave, whose length is large compared with slab thickness, encounters such a change in geometry. At points very close to the junction the field is modelled by a quasistatic solution. An outer approximation is calculated, based on the idea of replacing the actual slab by a hypothetical surface of infinitesimal thickness, with appropriate discontinuity conditions. A solution is determined in the form of an inverse Fourier integral, and explicit results are given for the reflection and transmission coefficients. (5 refs.)

59600 An improved solution to the fourth moment equation for intensity fluctuations. C.Macaskill (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).

Proc. R. Soc. London Ser. A (GB), vol.386, no.1791, p.461-74 (8 April 1983).

An approximate solution is presented for the fourth moment equation that describes fluctuations of intensity in a wave propagating through a randomly fluctuating medium. The solution is valid for high frequency or relatively strong fluctuations in the medium. The solution procedure is straightforward and at zero order agrees with previously derived approximate solutions. However, the present method is much more direct and more easily extended to complicated problems. Indeed, the first order correction to this basic solution is also determined and it is found that significantly better agreement with previous numerical work is obtained. In addition, knowledge of the correction term allows approximate estimates to be made for the error involved in using the basic solution. (17 refs.)

59601 Existence of global solutions in nonlinear wave equations. Y.Niwa (Dept. of Math., Univ. of Tokyo, Tokyo, Japan).

Proc. Jpn. Acad. Ser. A (Japan), vol.58, no.9, p.391-4 (Nov. 1982). [received: April 1983] (4 refs.)

59602 Control of wave processes with distributed controls supported on a subregion. J.Lagnese (Dept. of Maths., Georgetown Univ., Washington, DC, USA).

SIAM J. Control & Optimiz. (USA), vol.21, no.1, p.68-85 (Jan. 1983).

It is proved that solutions of one-dimensional wave equations satisfying general boundary conditions at the ends of a bounded interval I can be exactly controlled to any finite energy state by means of distributed controls which vanish outside of any fixed nonempty subinterval of I . An example is given which shows that no such general analogous result can hold in higher dimensions. In this case, for a spherical region, those states are characterized which can be exactly controlled to zero by means of controls supported in an annulus within the region. It is found that very strong controllability obtains when the controls are distributed near the boundary, but that only rather weak controllability is possible with controls supported in an interior annulus. Applications of these results to boundary control problems in annular regions are also discussed. (12 refs.)

59603 Nature of the instability in a system of two weakly coupled waves.

A.P.Kuznetsov (N.G. Chernyshevskii State Univ., Saratov, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.408-9 (Aug. 1982). Translation of:

Pis'ma v Zh. Tekh. Fiz. (USSR), vol.8, no.15-16, p.941-4 (Aug. 1982).

[received: April 1983]

Studies the nature of the instability in a situation in which it is not clear whether one is dealing with an amplifier or an oscillator. A method is proposed for studying the nature of the instability in multiparameter problems; this method radically shortens the formal mathematical aspect of the analysis. (3 refs.)

03.65 QUANTUM THEORY; QUANTUM MECHANICS

(see also 05.30 Quantum statistical mechanics; for relativistic wave equations, see 11.10)

59604 Exponential factor optimization in characteristic function method for electrically charged particles. M.Demiralp (Dept. of Appl. Math., Marmara Sci. & Industrial Res. Inst., Gebze-Kocaeli, Turkey).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.779-87 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The simplest basis function on hyperspherical coordinates with an optimization parameter is used to construct the characteristic function for a system of electrically charged particles. The first three coefficients of the serial expansion of the characteristic function in powers of eigenvalue parameter are evaluated in terms of well-known functions. The construction of a Pade table for this expansion with the aid of these coefficients, a theoretical discussion, the optimization of the exponential parameter, evaluation of ground state energies for certain systems, and finally comparison of accuracy increments due to optimization for several systems complete the work. (14 refs.)

59605 Scattering in view of the Titchmarsh-Weyl theory. M.Rittby, N.Elander (Res. Inst. for Phys., Stockholm, Sweden), E.Brandas.

Int. J. Quantum Chem. (USA), vol.23, no.3, p.865-74 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The Titchmarsh-Weyl theory for a singular second-order differential equation is presented. The equations, however, are arranged such that the theory is immediately applicable to the multichannel formulation. The mathematical basis of the Titchmarsh-Weyl theory (TWT) is outlined and the Titchmarsh-Weyl m function is presented. Relations to the associated Green's function and the spectral function are given. It is shown how some quantities common in scattering theory can be expressed in terms of the TWT. The method of complex rotation is then applied to the TWT to create a complex rotated analog of the Titchmarsh-Weyl theory. This is then extended as exterior complex scaling is introduced. An outline of a proof for the method of exterior complex scaling is presented and some numerical results of the complete theory are given. (32 refs.)

- 59606 Hypervirial theorems for some simple quantum chemistry systems.** F.M.Fernandez, E.A.Castro (INIFTA, Sección Química Teórica, La Plata, Argentina). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.915-19 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).
A very general form of the hypervirial theorems, which can be applied to several quantum systems of great interest for the theoretical quantum chemists is presented. (18 refs.)
- 59607 Affine Maczynski logics on compact convex sets of states.** J.Pykacz (Inst. of Maths., Univ. of Gdansk, Gdansk, Poland). *Int. J. Theor. Phys. (USA)*, vol.22, no.2, p.97-106 (Feb. 1983).
Sets of affine functions satisfying Maczynski orthogonality postulate and defined on compact convex sets of states are examined. Relations between affine Maczynski logics and Boolean algebras when the set of states is a Bauer simplex (classical mechanics, some models of nonlinear quantum mechanics) are studied. It is shown that an affine Maczynski logic defined on a Bauer simplex is a Boolean algebra if it is a sublattice of a lattice consisting of all bounded affine functions defined on the simplex. (10 refs.)
- 59608 Calculus on complex Banach spaces.** J.Pian, C.S.Sharma (Dept. of Maths., Birkbeck Coll., London, England). *Int. J. Theor. Phys. (USA)*, vol.22, no.2, p.107-30 (Feb. 1983).
Using the techniques of modern functional analysis, a variety of new concepts have been developed and new results proved which extend considerably the new calculus on complex Banach spaces developed by Sharma and Rebelo (1975). The distinguishing feature of the new calculus is that in this calculus the more general concept of additivity replaces that of linearity in the Frechet calculus. (9 refs.)
- 59609 Remarks on semiclassical quantization.** P.Pechukas (Dept. of Chem., Columbia Univ., New York, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3999-4004 (15 March 1983).
Semiclassical quantization in the basic, or 'primitive', version often predicts a simpler, more highly degenerate energy level spectrum than is observed. This point is illustrated by remarks on two-dimensional systems with threefold and higher rotational symmetry and on perturbations of such systems. For example, according to semiclassical quantization essentially all energy levels of a C_3 system are at least doubly degenerate. Such 'incorrect' degeneracy predictions are to be interpreted as predictions of coalescence of levels in the semiclassical ($\rightarrow 0$) limit, coalescence which may manifest itself in real spectra as an excess of near degeneracies. Finally, a consideration on degeneracy rules out one possible solution to the problem of semiclassical quantization of ergodic systems. (14 refs.)
- 59610 Semiclassical quantization and extraction of eigenfunctions using arbitrary trajectories.** N.de Leon, E.J.Heller (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4005-17 (15 March 1983).
The authors present in this paper a coordinate independent semiclassical quantization method. They demonstrate that in order to extract accurate eigenvalues and eigenfunctions the trajectory does not necessarily have to reside on the quantizing torus, rather, one can use information obtained on arbitrary tori. Because the method is coordinate independent, no difficulty is encountered in quantizing within classical resonance zones. Furthermore, nearby eigenstates and eigenvalues (nearly in action space) may be extracted from the same trajectory—this is especially convenient when the density of states becomes large. (29 refs.)
- 59611 On the $3j$ symmetries.** J.D.Newmarch (Dept. of Phys., Univ. Pertanian Malaysia, Selangor, Malaysia). *J. Math. Phys. (USA)*, vol.24, no.4, p.757-64 (April 1983).
The symmetric properties of the $3jm$ tensor for any finite or compact linear group are discussed using a wreath product construction. This is shown to provide a complete group theoretic explanation for all symmetry properties whether 'essential' or 'arbitrary'. The link with the similar—but distinct—method of inner plethysms is considered. (26 refs.)
- 59612 Some special $SU(3) \supset R(3)$ Wigner coefficients and their application.** K.T.Hecht, Y.Suzuki (Dept. of Phys. Dept., Univ. of Michigan, Ann Arbor, MI, USA). *J. Math. Phys. (USA)*, vol.24, no.4, p.785-92 (April 1983).
Bargmann space expansions of oscillator functions are used to derive analytic expressions for $SU(3) \supset R(3)$ Wigner coefficients for the couplings $(2,0) \times (0,2) \rightarrow (\lambda_3, \mu_3) L_3=0$ and $(\lambda_{10}) \times (\lambda_{20}) \rightarrow (\lambda_{30}, \mu_{30}) L_3=0$, with arbitrary (λ, μ) . These lead to expansions useful in nuclear cluster problems and are used to give a simple form for the $SU(3)$ -irreducible tensor expansion of a scalar two-body interaction, an application which motivated this investigation. (19 refs.)
- 59613 Operator formalism equivalent to the Feynmann quantization technique.** V.Janis, J.Soucek (Math. Inst., Czechoslovak Acad. of Sci., Prague, Czechoslovakia), V.Soucek. *J. Math. Phys. (USA)*, vol.24, no.4, p.834-8 (April 1983).
The concept of a Fock-Stueckelberg space of quantum states and a procedure of an operator quantization using only Lagrangians (kinematical quantization) are introduced. A propagator operator \mathcal{K} , matrix elements of which are Green's functions, is used, and an equation of motion for it is derived. The authors prove that kinematical quantization is an operator (coordinate-free) form of the Feynmann quantization technique. The Feynman path integral (FPI) is obtained as a spectral representation of the operator \mathcal{K} in a coordinate basis. The connection of a representation of commutation relations in this scheme, the domain of integration in FPI, and causality is mentioned. (12 refs.)
- 59614 Weak dispersion-free states and the hidden variables hypothesis.** P.Ptak (Tech. Univ. of Prague, Czechoslovakia). *J. Math. Phys. (USA)*, vol.24, no.4, p.839-40 (April 1983).
The author investigates dispersion-free states which are additive only on the pairs containing a central element (central-absolutely compatible). The author shows that any logic possesses plenty of such states, in fact, as many as a certain Boolean algebra. The latter result matches the hidden variables conjecture. (13 refs.)
- 59615 A generalization of Cohen's theorem.** R.Groblicki (Dept. of Math., Monash Univ., Clayton, Victoria, Australia). *J. Math. Phys. (USA)*, vol.24, no.4, p.841-3 (April 1983).
The theorem due to L. Cohen (1966, 1968), which implies that quantum mechanics cannot be formulated as a stochastic theory in phase space, is generalized. The assumption that the phase-space representatives of the density operators satisfy the quantum mechanical marginals is replaced by the weaker condition of Ω -representability. (10 refs.)
- 59616 A partial inner product space of analytic functions for resonances.** L.P.Horwitz, E.Katznelson (Dept. of Phys. & Astron., Tel Aviv Univ., Ramat Aviv, Israel). *J. Math. Phys. (USA)*, vol.24, no.4, p.848-59 (April 1983).
Generalized Hilberg spaces $D(\alpha, \beta)$ are defined using analytic continuation of Hardy class functions into a wedge bounded by the angles α, β . Eigenfunctions of isolated complex eigenvalues may be found in $D(\alpha, \beta)$ for operators that have a self-adjoint representation in L^2 . These eigenvalues correspond to resonances in the associated decay problem. A bilinear form between $D(\alpha, \beta)$ and $D(-\beta, -\alpha)$ is defined, which has some of the properties of a Hilbert space scalar product, and it is shown that this form can be used to define a variational principle to obtain the eigenvalue equations. (19 refs.)
- 59617 The generalized anharmonic oscillator in three dimensions: Exact eigenvalues and eigenfunctions.** A.Rampal, K.Datta (Dept. of Phys. & Astron., Univ. of Delhi, Delhi, India). *J. Math. Phys. (USA)*, vol.24, no.4, p.860-6 (April 1983).
The authors study the generalized anharmonic oscillator in three dimensions described by the potentials of the form $\Sigma_{k=1}^{2m+1} b_k r^{2k}$. The asymptotic analysis of the Schrodinger equation yields the leading asymptotic behavior of the energy eigenfunctions in terms of the dominant $(m+1)$ coupling constants b_k , $m+1 \leq k \leq 2m+1$. Using an ansatz which incorporates this asymptotic behavior, they reduce the eigenvalue equation to an $(m+2)$ -term difference equation. The corresponding Hill determinant may be used to factorize with a finite determinant as a factor, if a set of constraints on the couplings is satisfied; an infinite sequence of such sets exists. The exact energy eigenvalues appear as the real roots of the finite factor of the Hill determinant; the corresponding wavefunctions are Gaussian weighted polynomials. The authors consider the potentials $\Sigma_{k=1}^{2m} b_k r^{2k}$ and $\Sigma_{k=1}^{2m} b_k r^{2k}$ explicitly; potentials of the form $\Sigma_{k=1}^{2m} b_k r^{2k} + \Sigma_{k=1}^{2m} b_k r^{2k} + \delta/r$ containing both even and odd terms are also considered. Finally, they show that this method of constructing exact solutions fails for anharmonic potentials of the form $\Sigma_{k=1}^{2m} b_k r^{2k}$, of which the quartic anharmonic oscillator is the simplest example. (9 refs.)
- 59618 On the nonlinear Schrodinger equation and its fluid-dynamical form.** T.F.Nonnenmacher (Center for Studies of Nonlinear Dynamics, La Jolla Inst., La Jolla, CA, USA), G.Dukek, G.Baumann. *Lett. Nuovo Cimento (Italy)*, vol.36, ser.2, no.14, p.453-6 (2 April 1983).
Derives and generalizes the fluid-dynamical form of the nonlinear Schrodinger equation (NLS) $i\hbar\psi_t = -\hbar^2/2m \nabla^2\psi + V(x) + \kappa|\psi|^2\psi$ with $\psi_t = \partial\psi/\partial t$ by starting out with the canonical Poisson-Hamilton formalism. (10 refs.)
- 59619 On the gradient method in quantum mechanics.** G.Fonte (Istituto di Fisica Teorica, Univ. di Catania, Catania, Italy), G.Schiffner. *Nuovo Cimento B (Italy)*, vol.74B, ser.2, no.1, p.1-26 (11 March 1983).
The authors present the gradient method as a numerical procedure for the discrete spectrum of Hamiltonian operators in a version which is more general and has better numerical flexibility than a previous version. They show that the gradient method, in addition to having relationships to the Rayleigh-Schrodinger perturbation theory and to the variational method, has also some advantageous features in comparison with them and even in comparison with the Pade and Borel summability methods. In order to check the numerical efficiency of their procedure, they have applied it to the calculation of the ground-state energy of the anharmonic oscillators $p^2 + x^2 + \beta x^4$ and $p^2 + x^2 + \beta x^8$ for a large range of β . (25 refs.)
- 59620 A generalized treatment of point canonical transformations in the path integral.** H.O.Girotti, T.J.M.Simoes (Inst. de Fisica, Univ. Federal do Rio Grande do Sul, Porto Alegre, Brazil). *Nuovo Cimento B (Italy)*, vol.74B, ser.2, no.1, p.59-66 (11 March 1983).
The authors investigate nonlinear point canonical transformations within the path integral when an arbitrary discrete procedure is used for defining this integral. A complete derivation of the so-called additional potential, entirely carried out within the functional formalism, is given in this general case. They also present an extension of the average method of McLaughlin and Schulman (1971). (12 refs.)
- 59621 A Backlund transformation for a generalised Calogero-Moser system.** J.Gibbons, T.Hermens, S.Wojciechowski (Istituto di Fisica, Univ. di Roma I, Rome, Italy). *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.251-3 (21 March 1983).
A Backlund transformation for a generalised Calogero-Moser system, in which the particles possess extra, internal, degrees of freedom, is given. It is shown to be a canonical transformation and its generating function is given explicitly. The transformation is compared with that of the usual Calogero-Moser system. (4 refs.)
- 59622 Test of the gauge-invariant formulation of quantum mechanics.** Kuo-Ho Yang (Phys. Dept., St. Ambrose Coll., Davenport, IA, USA). *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.259-63 (21 March 1983).
An experiment, based on a spin system in a static and a time-varying magnetic field, is proposed and analyzed to test the conventional and the gauge-invariant formulations of quantum mechanics. The electric-dipole interaction is reviewed to show that these two formulations can produce the same results when the magnetic interaction is neglected. (21 refs.)
- 59623 Quantum correlations do not transmit signals.** T.F.Jordan (Phys. Dept., Univ. of Minnesota, Duluth, MN, USA). *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.264 (21 March 1983).
That signals cannot be transmitted with the correlations observed in the Einstein-Podolsky-Rosen experiments that violate Bell's inequalities is shown to be a simple general property of correlations between separate subsystems of any quantum-mechanical system. It does not depend, for example, on the particular properties of the state of two spin $1/2$ particles with total spin zero. (6 refs.)
- 59624 The nonlinear evolution equations related to the Wadati-Konno-Ichikawa spectral problem.** M.Boiti, F.Pempinelli, G.Z.Tu (Dipartimento di Fisica, Univ. di Lecce, Lecce, Italy). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.48-64 (Jan. 1983).
The Wadati-Konno-Ichikawa (WKI) spectral problem is considered and the nonlinear evolution equations (NLEE) related to this problem are explicitly constructed. Together with the integrable NLEE already found by WKI, new pure differential solvable NLEEs are derived. The properties of the integro-differential operator L generating all the considered NLEEs are studied. It is shown that the usually successful procedure used to derive the Backlund transformation does not work with these highly nonlinear evolution equations. (18 refs.)
- 59625 New U -matrix theory in quantum mechanics.** C.C.Lam, P.C.W.Fung (Phys. Dept., Univ. of Hong Kong, Hong Kong). *Phys. Rev. A (USA)*, vol.27, no.4, p.1760-78 (April 1983).
The authors have analyzed Dyson's U -matrix theory of solving the Schrodinger equation in the interaction picture and are able to express the U matrix as a dominant term plus an infinite series involving multiple integrals of time. For a certain rather restrictive class of Hamiltonians, their theory is exact for a general time-dependent problem. For other Hamiltonians, they can only

obtain approximate expressions for their U matrix and hence the wave function. Treating a time-independent problem as a special case of the time-dependent situation with a sudden-switching process, they have shown that a U matrix is exact. To demonstrate the working procedures of their theory, they apply it to study the well-known time-independent charged harmonic-oscillator problem and the more general harmonic oscillator with a time-dependent driving force. Compared with other methods, their new theory appears to lead to a result which contains more information than others due to the inclusion of noncommutability properties of operators in the operator Schrodinger equation. It has been shown that the classical Feynman path-integral formalism can be deduced from quantum mechanics with the use of the Green's-function operator. It is interesting to note that apart from a step function, the Green's-function operator is the same as that of the authors' $U^{(B)}$ matrix, which is the U matrix obtained within the regime of the Schrodinger picture for a time-independent Hamiltonian, as a special case of their general time-dependent treatment. (25 refs.)

59626 Classical limit of an induced harmonic oscillation with radiation damping. T. Toyoda, K. Wildermuth (Inst. für Theoretische Phys., Tübingen, Germany).

Phys. Rev. A (USA), vol.27, no.4, p.1790-802 (April 1983).

The previously proposed method to obtain classical limits of quantized fields using von Neumann-lattice coherent states as basis states for the projection form of the Schrodinger equation (Toyoda and Wildermuth, 1980) is modified in order to take into account the reaction of the radiation field to the charge in a compact manner. The modification is based on the work of Glauber (1965) on the time evolution of coherent states. To illustrate the method, a charged harmonic oscillator with and without initial external electromagnetic field is investigated. (10 refs.)

59627 Example of two distinct potentials without point eigenvalues which have the same scattering operator with the reflection coefficient $\alpha(0) = -1$. H.E. Moses (Center for Atmospheric Res., Univ. of Lowell, Lowell, MA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2220-1 (April 1983).

Abraham, DeFacio, and Moses and Brownstein (1981) have given examples of pairs of potentials, which support no point eigenvalues, but which have the same scattering operator. These potentials all have δ -function contributions to them. In the present paper, a pair of potentials is given, neither of which has a δ -function contribution, such that they both have the same simple scattering operator. Like the earlier examples, the new potentials violate the range condition of Faddeev (1965) and Deift and Trubowitz (1969) used in the proof of the one-to-one correspondence of potentials to scattering operators. Thus the present example is an addition to the list of long-range potentials with simple eigenfunctions and scattering operators. (4 refs.)

59628 Quantum theory and non-Kolmogorovian probability. L. Accardi (Dipartimento di Matematica, Univ. di Roma, Roma, Italy).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.1-12

Gives a progress report on the author's work concerning the classical probabilistic model, in whose framework the quantum statistical model may be described. The author's approach considers that the possibility of describing a set of conditional probabilities within the framework of a given statistical model can be checked using statistical invariants. Two problems are discussed in particular. The description of non-Kolmogorovian models and the computation of statistical invariants relative to a given set of conditional probabilities and to a given probabilistic model. (9 refs.)

59629 Stochastic jump processes in the phase space representation of quantum mechanics. J. Bertrand, G. Rideau (Lab. de Phys. Theorique et Math., Univ. Paris VII, Paris, France).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.13-18

Describes the evolution of quantum observables in terms of stochastic jump processes, following a procedure similar to that set up by Maslov (1980) and extended by Ph. Combe et al. To characterize these observables, the authors use the representation by functions on phase space due to Wigner (1966) and restrict it mainly to observables described by bounded continuous functions (belonging to $C(\mathbb{R}^2)$). (4 refs.)

59630 Transformation of Wiener integrals and the desingularization of Coulomb problem. P. Blanchard (Fakultät für Phys., Univ. Bielefeld, Bielefeld, Germany).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.19-28

Discusses the correspondence between the Coulomb problem and the harmonic oscillator at the level of stochastic differential equations associated with the corresponding imaginary-time Schrodinger equation that can be solved by the Wiener integral. (7 refs.)

59631 Laplace expansions of conditional Wiener integrals and applications to quantum physics. I. Davies, A. Truman (Dept. of Heriot-Watt Univ., Edinburgh, Scotland).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.40-55

Gives an account of rigorous results on the Laplace expansions of conditional Wiener integrals, their proofs, and some of their applications to quantum mechanics. (25 refs.)

59632 A stochastic picture of spin. W.G. Faris (Dept. of Math., Univ. of Arizona, Tucson, AZ, USA).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.154-68

Dankel (1970) has shown how to incorporate spin into stochastic mechanics. The author shows how the resulting non-local hidden variable theory gives an appealing picture of spin correlation experiments in which Bell's inequality is violated. (6 refs.)

59633 Momentum-position complementarity in stochastic mechanics. F. Guerra (Istituto Matematico 'G. Castelnuovo', Univ. di Roma, Roma, Italy), L. Morato.

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.208-15

Investigates and clarifies the role of momentum variables in stochastic mechanics, to see whether some of the canonical transformation theory formalism of classical and quantum mechanics can be transferred and adapted to the stochastic frame. (13 refs.)

59634 Wiener measures for quantum mechanical path integrals. J.R. Klauder (Bell Labs., Murray Hill, NJ, USA), I. Daubechies.

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.245-7

Shows that it is possible to represent certain quantum mechanical evolution operators by path integrals with mathematically well-defined measures. For the hamiltonians considered, this measure is a Wiener measure on phase space. To achieve this goal the authors exploit the overcompleteness of the coherent states. (3 refs.)

03.80 GENERAL THEORY OF SCATTERING

(see also 11.20 *S-matrix theory*, and 11.80 *Relativistic scattering*)

59635 Long-range interactions in free-free transitions. L. Rosenberg (Dept. of Phys., New York Univ., New York, NY, USA).

Phys. Rev. A (USA), vol.27, no.4, p.1879-86 (April 1983).

The soft-proton approximation for bremsstrahlung derived some time ago by Low (1958) and extended by Feshbach and Yennie (1962) to allow for resonances, is further generalized, in the framework of nonrelativistic scattering theory, to apply to the case where the scattering potential has a long-range Coulomb tail. The derivation is based on an asymptotic evaluation of the matrix element in configuration space in which electric-dipole, magnetic-dipole, and electric-quadrupole components of the particle-field interaction are accounted for. The $M1$ and $E2$ contributions give rise to retardation corrections, of order v/c , to the leading $E1$ term. The Coulomb tail has the effect of introducing certain factors into the approximate bremsstrahlung amplitude which depend logarithmically on the photon frequency. The result obtained here has an immediate application to the problem of Coulomb scattering in a low-frequency laser field and provides a generalization of earlier work based on the electric-dipole approximation. (12 refs.)

59636 Variational scattering theory with functionals of fractional form. J.W. Darweych, M. Horbatsch (Phys. Dept., York Univ., Toronto, Ontario, Canada).

Phys. Rev. A (USA), vol.27, no.4, p.2245-7 (April 1983).

The recently proposed functional of Takatsuka and McKoy (1981), derived from the Schwinger-type Newton functional, is shown to follow from the usual Hulthen-Kohn variational principle. A generalization of their method becomes obvious in this approach and its better convergence is demonstrated on a simple example. (5 refs.)

59637 Prolongation structure, Backlund transformation and principal homogeneous Hilbert problem in general relativity. Guo Han-ying, Wu Ke (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China), Wang Shi-kun.

Commun. Theor. Phys. (China), vol.2, no.1, p.883-98 (1983).

The authors briefly review the prolongation structure theory for nonlinear systems, such as nonlinear evolution equations and soliton equations. They then present a set of new fundamental equations of prolongation structures for nonlinear systems and a criterion of completeness for conservation laws. A general requirement for auto-Backlund transformations is proposed from the point of view of prolongation structure theory and it is shown that the problem of searching for auto-Backlund transformations can be reduced to a principal homogeneous Hilbert problem. The theory is applied to the various solution generating techniques for gravitational fields with two commuting Killing vectors. The authors also introduce principal inverse scattering problems with respect to the principal pseudopotentials (i.e. the W -potentials) for both vacuum and electrovac cases. Finally, they show the solutions of the n -fold Kerr family and n -fold charged Kerr family by solving the corresponding principal homogeneous Hilbert problem. (31 refs.)

59638 The N -fold Kerr family and charged Kerr family solutions. Wang Shi-kun (Inst. of Appl. Math., Acad. Sinica, Beijing, China), Guo Han-ying, Wu Ke.

Commun. Theor. Phys. (China), vol.2, no.1, p.921-7 (1983).

The N -fold Kerr family and charged Kerr family solutions are given by means of the inductive method to solve the principal homogeneous Hilbert problems associated with the principal inverse scattering equations (i.e. the W -equations) for both vacuum and electrovac cases with stationary axial symmetry in general relativity. (9 refs.)

59639 Spherically symmetric conformally-flat perfect fluid distributions of class-1. S.N.Pandey, Y.K.Gupta, S.P.Sharma (Dept. of Maths., Univ. of Roorkee, Roorkee, India).

Indian J. Pure & Appl. Math., vol.14, no.1, p.79-84 (Jan. 1983).

It is well-known that the Schwarzschild interior solution is the most general static spherically symmetric perfect fluid distribution which is of class-1 as well as, conformal to a flat-space-time. The authors have obtained the most general non-static perfect fluid distribution which is conformally flat as well as of class-1. (5 refs.)

59640 Field of a charged particle in the presence of scalar meson fields in general relativity. D.R.K.Reddy, V.U.M.Rao (Dept. of Appl. Math., Andhra Univ., Waltair, India).

J. Aust. Math. Soc. Ser. B (Australia), vol.24, pt.4, p.461-5 (April 1983).

Field equations for coupled gravitational and zero mass scalar fields in the presence of a point charge are obtained with the aid of a static spherically symmetric conformally flat metric. A closed form exact solution of the field equations is presented which may be considered as describing the field of a charged particle at the origin surrounded by the scalar meson field in a conformally flat space-time. (13 refs.)

59641 Numerical relativity. II. Numerical methods for the characteristic initial value problem and the evolution of the vacuum field equations for space-times with two Killing vectors. R.W.Corkill, J.M.Stewart (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England). *Proc. R. Soc. London Ser. A (GB)*, vol.386, no.1791, p.373-91 (8 April 1983). For pt.1 see ibid., vol.384, p.427-454 (1982). The authors consider the numerical solution of the characteristic initial value problem in general relativity. Although the equations to be integrated have regular coefficients, the nonlinearity leads to the occurrence of singularities after a finite evolution time. They first discuss some novel techniques for integrating the equations right up to the singularities, and secondly present as examples the numerical evolution of the Schwarzschild and certain colliding plane wave space-times. (10 refs.)

59642 Solutions of Einstein field equations with zero-mass scalar field and conformal scalar field from vacuum solutions of Einstein field equations. V.B.Johri (Dept. of Math., Indian Inst. of Technol., Madras, India), G.K.Goswami, R.C.Srivastava.

Prog. Theor. Phys. (Japan), vol.69, no.1, p.341-3 (Jan. 1983).

Generation technique has been used to obtain solutions of Einstein field equations with zero-mass scalar field and a new class of solutions of Einstein-Maxwell field equations with an ordinary scalar field. (12 refs.)

59643 Maxwellian formalism of incompressible fluid mechanics. M.S.Garrido (CAUTL-INIC, Lisboa, Portugal).

Port. Phys. (Portugal), vol.13, no.3-4, p.233-8 (1982). In French.

Using a Maxwellian formalism, it is shown how to pass from relativistic equations to galilean equations by the condition $c \rightarrow \infty$. (4 refs.)

59645 The problem of motion in the Kaluza theory. Wu Ke, Guo Han-ying (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.1, no.6, p.745-51 (1982).

It is shown that the equations of motion for a charged massive particle are consequences of the field equations in Kaluza unification theory of gravitation and electromagnetism, i.e. the equations of motion for the particle can be deduced from Kaluza field equations, just as that in Einstein's theory of motion of general relativity the equations of motion for a massive particle are consequences of the Einstein equations. Furthermore, the Lorentz equations for a particle moving in the Maxwell electromagnetic field on the Minkowski space-time can also be obtained from the Maxwell equations by means of the Kaluza mechanism of the Maxwell theory. (11 refs.)

04.50 UNIFIED FIELD THEORIES AND OTHER THEORIES OF GRAVITATION

59647 Spontaneous compactification in six-dimensional Einstein-Maxwell theory. S.Randjbar-Daemi (Internat. Centre for Theoretical Phys., Trieste, Italy), A.Salam, J.Strathdee.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.3, p.491-512 (18 April 1983).

A discrete set of solutions to the classical Einstein-Maxwell equations in six-dimensional space-time is considered. These solutions have the form of a product of four-dimensional constant curvature space-time with a 2-sphere. The Maxwell field has support on the 2-sphere where it represents a monopole of magnetic charge, $n = \pm 1, \pm 2, \dots$. The spectrum of massless and massive states is obtained for the special case of flat 4-space, and the solution is shown to be classically stable. The limiting case where the radius of the 2-sphere becomes small is considered and a dimensionally reduced effective lagrangian for the long range modes is derived. This turns out to be an $SU(2) \times U(1)$ gauge theory with chiral couplings. (11 refs.)

59648 Kaluza-Klein theories on bundles with homogeneous fibers. I. R.Percacci (Istituto di Fisica Teorica, Univ. di Trieste, Trieste, Italy), S.Randjbar-Daemi.

J. Math. Phys. (USA), vol.24, no.4, p.807-14 (April 1983).

The authors analyze some geometric aspects of Kaluza-Klein theories under the assumption that the $(4+d)$ -dimensional space is a bundle over space-time M with fiber G/H . They formulate the most general metric in the bundle which leads, upon dimensional reduction of the Ricci scalar, to a G -gauge invariant Lagrangian. They find that the treatment of Brans-Dicke-like scalars given by some authors is inconsistent with the bundle-theoretic interpretation. (19 refs.)

59649 On a possible new theory of gravitation. M.Borneas. *Naturwissenschaften (Germany)*, vol.70, no.3, p.140 (March 1983).

The scientist not specializing in the physics of gravitation may wonder at the current situation with regard to theoretical views on this problem. On the one hand, there is Einstein's well-known theory and, on the other hand, many sound arguments (Mach's principle, etc.) have been presented which modify Einstein's equation, from Jordan and Brans-Dicke up to many recent works. Most authors propose a supplementary scalar field. However, the gravitation experiments performed hitherto, under usual conditions, specifically in the solar system, have strongly supported Einstein's equation. How then can one get out of this dilemma? The author suggests that a supplementary field exists, but that its contribution under the conditions in the experiments conducted thus far has been negligible. But this might not be the case under different conditions, in other domains of space. (10 refs.)

59650 Remarks on the Brans-Dicke theory of N dimensions. M.Nishioka (Dept. of Phys., Yamaguchi Univ., Yamaguchi, Japan).

Nuovo Cimento B (Italy), vol.74B, ser.2, no.1, p.27-32 (11 March 1983).

A study of the Brans-Dicke theory in vacuum shows that one of the Brans-Dicke equations is represented in terms of the Riemann curvature tensor, the Weyl projective curvature tensor and its covariant derivative. Studying the case that the covariant derivative of the Weyl projective curvature tensor vanishes, the author comments on the relationship between the Brans-Dicke space-time and the constant curvature space-time. (6 refs.)

59651 On the structure of space, time and field. T.Kaneko, H.Sugawara (Nat. Lab. for High Energy Phys., KEK, Ibaraki, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.262-99 (Jan. 1983).

A unified theory of gravity and other interactions is proposed. The authors are guided by the principle of equivalence of space-time and field and by Mach's principle. Fundamental Lagrangian is assumed to describe the whole Universe on the one hand and local physical phenomena on the other. A condensed scalar field determines both the structure of the Universe and that of the group of grand unification. The Hubble constant and deceleration parameter are related to the grand unification group. One remarkable feature of their theory is the dependence of the gravitational and the gauge coupling constants on the cosmological time. (10 refs.)

59652 Stationary line of N Kerr masses kept apart by gravitational spin-spin interaction. M.Yamazaki (Dept. of Phys., Kanazawa Univ., Kanazawa, Japan).

Phys. Rev. Lett. (USA), vol.50, no.14, p.1027-30 (4 April 1983).

The metric is presented, in terms of six determinants of degree N , in a concise closed form, describing N collinear isolated Kerr masses ($N=1,2,3,\dots$) balanced by their gravitational spin-spin interaction. Two hitherto unnoticed potentials \tilde{L} and \tilde{M} are introduced to evaluate the metric function ω . The conditions for regularity of the metric on the symmetrical axis are presented. (6 refs.)

59653 Comment on 'Schiff's conjecture on gravitation'. Wei-Tou Ni (Dept. of Phys., Nat. Tsing Hua Univ., Hsinchu, Taiwan), A.Coley.

Phys. Rev. Lett. (USA), vol.50, no.15, p.1173-4 (11 April 1983).

Using a general formalism with seven nonmetric degrees of freedom, Coley (1982) has studied the validity of Schiff's conjecture in a spherically symmetric and static (SSS) gravitational field. This adds to the understanding of Schiff's conjecture considerably. In 1960, Schiff conjectured that the Galileo weak equivalence principle (WEP) should imply the Einstein equivalence principle (EEP), and, therefore, imply the universality of gravitational red shift (UGR). The results of Coley's extensive calculations actually show that WEP-EEP (Schiff's conjecture) and hence also that WEP-UGR in SSS gravi-

tational field in his formalism. This demonstrates the importance and usefulness of WEP. (10 refs.)

04.60 QUANTUM THEORY OF GRAVITATION

59654 Hamiltonian formulation for a translation gauge theory of gravitation. R.De Azeredo Campos, C.G.Oliveira (Dept. de Física, Univ. de Brasília, Brasília, Brazil).

Nuovo Cimento B (Italy), vol.74B, ser.2, no.1, p.83-92 (11 March 1983). Dirac's Hamiltonian methods are applied to a gauge theory of the translation group formulated by Hayashi (1967, 1972, 1973, 1977) as a gravitational theory which stands on microscopical scale. Four constraint equations are obtained, as in general relativity, because of the existence of the space-time translation group, which is a group of invariance of the theory. Propagation equations for the dynamical variables are also derived. (14 refs.)

59655 Hamiltonian formulation of the gauge theory of gravitation. Pure-gravity case. T.Fukuyama (Dept. of Phys., Osaka Univ., Osaka, Japan), K.Kamimura.

Nuovo Cimento B (Italy), vol.74B, ser.2, no.1, p.93-111 (11 March 1983).

The gauge theory of gravitation invariant under O_3 and the general coordinate transformations is formulated by using Dirac's Hamiltonian formalism. The tetrad field is introduced as a connection of the O_3 gauge group. By fixing the boost part of this gauge freedom, the spin connection is eliminated by using second-class constraints. As a result the system is described by the tetrad field with a set of first-class constraints associated to the local Lorentz and the general co-ordinate transformations. (15 refs.)

59656 Schouten manifold with a spinor structure. T.Obata (Dept. of Electrical Engng., Tohoku Univ., Sendai, Japan), H.Oshima.

Prog. Theor. Phys. (Japan), vol.69, no.1, p.314-22 (Jan. 1983).

The authors equip a general Schouten manifold with a spinor structure and further with a spinor metric, a spinor affine connection and a linear isomorphism of the tangent vector space into the spinor space which is a two-dimensional complex vector space. The nonmetrical tensor that measures the failure of the affine connection to preserve the metric can then be expressed in fundamental geometrical objects which are related to the above spinorial objects. They also give a method of reducing the Schouten manifold to special manifolds such as the Weyl-Cartan manifold and the Riemann-Cartan manifold. (11 refs.)

59657 A model for quantum gravity: an effective approach to Einstein theory. A.Aurilia (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada), M.Martellini.

Phys. Lett. B (Netherlands), vol.123B, no.5, p.303-7 (7 April 1983).

The authors propose a renormalizable and unitary non-abelian gauge theory for gravitational interactions possessing $Sp(4)$ as a partially conserved gauge symmetry. For energies below the Planck mass the theory reproduces Einstein's general relativity which they regard as an effective theory of gravitational interactions. (9 refs.)

04.65 SUPERGRAVITY

59658 Supergravity with one auxiliary spinor. M.F.Sohnius (CERN, Geneva, Switzerland), P.C.West.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.1, p.100-24 (25 April 1983).

The authors present an 'intermediate' off-shell version of $N=1$ supergravity and its tensor calculus. The supergravity multiplet has 16+16 field components. The formulation can be constrained to either of the minimal ones with 12+12 components, or enlarged by matter couplings to several 20+20 component versions. Self-coupled to its own axial gauge submultiplet it leads to spontaneous supersymmetry breaking in the form first discussed by Freedman (1977) and to a propagating gauge field. (19 refs.)

59659 Gravitinos on the lattice. G.Maturana, C.P.van den Doel (Dept. of Phys., Univ. of California, Santa Cruz, CA, USA).

Phys. Lett. B (Netherlands), vol.123B, no.5, p.332-4 (7 April 1983).

Studies spin 3/2 fields on the lattice. Species doubling is found to be totally curable with an analogue of Wilson's method (1974) and partially with an analogue of the Kogut-Susskind formalism (1977). Only the latter preserves local supersymmetry but describes at least four species. (12 refs.)

59660 BRST invariance and the stochastic quantization of supergravity. T.Hori (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).

Phys. Lett. B (Netherlands), vol.123B, no.6, p.391-5 (14 April 1983).

The quantization of $N=1$ supergravity without auxiliary fields is considered from a stochastic point of view. Using the BRST symmetry properties of a closed algebra, sufficient conditions for the equivalence of the stochastic and the Faddeev-Popov quantization are derived. (11 refs.)

59661 A geometric interpretation for certain scalar-tensor gravity theories. G.F.Chapline (Lawrence Nat. Lab., Univ. of California, Livermore, CA, USA).

Phys. Lett. B (Netherlands), vol.123B, no.6, p.401-6 (14 April 1983).

Dimensional reduction of ten-dimensional $N=1$ supergravity, where the space of extra dimensions is a compact coset space, leads to a class of non-linear σ -models coupled to gravity. Some members of this class contain only spin 2 and spin 0 fields while other members of this class are supersymmetric non-linear σ -models coupled to supergravity. In all cases the scalar field self-coupling constants are simply related to Newton's constant. (12 refs.)

59662 Hierarchies from supergravity. U.Ellwanger (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).

Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.34-6 (21 April 1983). Discusses a non-minimal coupling of scalar fields to supergravity. As well as spontaneous local supersymmetry breaking and a vanishing cosmological constant the author can obtain a gravitino mass of ~ 100 GeV without introducing a mass scale different from the Planck scale. (13 refs.)

59663 Fermion masses from supergravity. D.V.Nanopoulos, M.Srednicki (CERN, Geneva, Switzerland).

Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.37-9 (21 April 1983).

The authors suggest that non-renormalizable interactions (contained, for example, in supergravity theories) are the source of the fermion masses for the first two generations. Small Yukawa couplings are not necessary. They find a new mass relation, $m_e/m_\mu = 2/3$ at the grand unification scale, which is consistent (after renormalization) with low energy physics. (12 refs.)

59664 Gauged $n=8$ supergravity and its breaking from spontaneous compactification. B.Biran, F.Englert (Faculte des Sci., Univ. Libre de Bruxelles, Brussels, Belgium), B.de Wit, H.Nicolai.

Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.45-50 (21 April 1983).

Gauged $N=8$ supergravity emerges from spontaneous compactification of eleven-dimensional supergravity on the riemannian S^7 . This is the only non-trivial compactification scheme preserving full supersymmetry. The four-dimensional theory admits a spontaneously broken solution describable as a compactification on the parallelized S^7 ; supersymmetry is completely broken and the local $SO(8)$ group is reduced to G_2 . (13 refs.)

59665 Radiative corrections to the effective potential in $N=1$ supergravity. R.Barbieri (Istituto di Fisica, Univ. Pisa, Pisa, Italy), S.Cecotti.

Z. Phys. C (Germany), vol.17, no.2, p.183-7 (1983).

The authors compute the one loop quadratic divergences to the effective potential of the matter scalars in $N=1$ supergravity. They discuss in some special instances (the Das-Freedman and the Deser-Zumino lagrangians) the problem of supersymmetry gauge invariance. They comment on the relevance of the calculation to model building. (17 refs.)

59666 Ensemble corrections for the molecular-dynamics ensemble. D.C.Wallace, G.K.Straub (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2201-5 (April 1983).

Expressions are derived which relate the averages of a dynamical variable in the molecular-dynamics ensemble and in the generalized canonical ensemble. Fluctuations in the two ensembles are also related. These results make the full equilibrium theory of classical statistical mechanics accessible to evaluation by molecular-dynamics computations. (13 refs.)

59667 Concerning the description of processes in objects of finite size. Yu.S.Sereda (Res. Inst. for Mech., State Univ., Gorki, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1058-62 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1725-30 (Sept. 1982).

[received: April 1983]

A beta distribution is proposed for use as a statistical model of real objects. It is shown that the beta distribution and its entropy can describe fairly completely the physical properties of an investigated object and the processes that occur in it in terms of a sequence of states, each of which can deviate from equilibrium. Possible forms and properties of trajectories of processes with monotonic and external entropy changes are discussed. (18 refs.)

59668 The Van Hove limit in classical and quantum mechanics. G.F.Dell'Antonio (Istituto Matematico G. Castelnuovo, Univ. di Roma, Roma, Italy).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.75-110

Outlines an approach to describing the motion of a classical or quantum particle in a random medium. In particular the Van Hove limit of small coupling, long time is studied for the momentum distribution in both classical mechanics and quantum theory. (9 refs.)

59669 Stochasticity in non-equilibrium statistical mechanics. G.G.Emch (Dept. of Math., Univ. of Rochester, Rochester, NY, USA).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.147-53

Outlines a proposal to incorporate the following areas into one line of research. Hamiltonian systems, the thermodynamical limit, infinite KMS systems, the choice of time scale, dissipative systems, are reduced description, EK systems. Two lines of enquiry are followed which lead to non-equilibrium statistical mechanics. (10 refs.)

05.30 QUANTUM STATISTICAL MECHANICS

(see also 67. Quantum fluids, and 71. Electron states in condensed matter)

59670 The Thirring model at a finite fermion density. Y.Okwamoto (Dept. of Engng. & Sci., Hokkaido Univ., Sapporo, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.4, p.1081-3 (April 1983). The spectrum of the massless Thirring model at a finite fermion density is examined, using the Bethe ansatz, with the momentum cutoff. The cutoff procedure in this letter is valid for the model within the first order of the coupling constant. (8 refs.)

59671 Magnetic moment of an electron gas in crossed, homogeneous electric and magnetic fields. P.Achuthan, S.Benjamin, K.Venkatesan (Dept. of Math., Indian Inst. of Technol., Madras, India). *J. Phys. A (GB)*, vol.16, no.6, p.1307-13 (21 April 1983). The magnetic properties of a Dirac electron gas in crossed, homogeneous electric (E) and magnetic (H) fields are studied. An explicit expression for the magnetic moment of the gas is obtained. The calculations in the degeneracy limit of the gas show that (i) for values of $E/H > 0.01$ there is a clear suppression of the transition from paramagnetism to diamagnetism, (ii) there is a weakening of the quasi-periodic oscillations of the magnetic moment observed in the $E=0$ case, again for $E/H > 0.01$, and (iii) there is a distinct possibility of spontaneous magnetisation for the values of $E/H > 0.9$. (13 refs.)

59672 Path integration of an action related to an electron gas in a random potential. A.K.Dhara, D.C.Khandekar, S.V.Lawande (Theoretical Reactor Phys. Section, Bhabha Atomic Res. Centre, Bombay, India). *J. Math. Phys. (USA)*, vol.24, no.4, p.844-7 (April 1983). Path integration of an action related to an electron gas in a random potential is performed within the framework of Feynman's polygonal path approach. The exact propagator obtained is simply related to the harmonic oscillator propagator. The integration is direct and does not require the knowledge of an auxiliary measure or the artificial coupling of the system to the external forces. (11 refs.)

59673 Existence theorems for Segal quantization via spectral theory in Krein space. P.Broadbridge (School of Phys. & Geosci., Western Australian Inst. of Technol., South Bentley, WA, Australia). *J. Aust. Math. Soc. Ser. B (Australia)*, vol.24, pt.4, p.439-60 (April 1983). Segal's unitarizing complex structure J is shown, in Fermi-Dirac statistics to be the orthogonal component in the polar decomposition of the real skew adjoint generator of classical dynamics. It is proven that in Bose-Einstein statistics the classical symplectic dynamics cannot be unitarized unless the generator is similar to a real skew adjoint operator. With the classical Hamiltonian strictly positive, J is the pseudo-orthogonal component in the polar decomposition of the generator, using spectral theory in Krein space with indefinite metric. Thus, J can be expressed simply in terms of the projection $E(0)$ onto the subspace of classical solutions with negative frequency. This complements the physicists' experience that conceptual difficulties arise when dynamically invariant separation of positive and negative frequency solutions is impossible. (26 refs.)

59674 On the global variance in the 1-reduced local energy matrix for closed shell fermion systems. G.F.Thomas (Massey Coll., Univ. of Toronto, Toronto, Ontario, Canada). *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.265-8 (21 March 1983). The global variance in the 1-reduced local energy matrix is proposed as a quantitative measure of the error incurred through use of the Roothaan procedure in a limited basis for a closed shell fermion system. Applications are presented for the singlet ground states of a pair of coupled harmonic oscillators and the hydrogen molecule. (17 refs.)

59675 Monte Carlo evaluation of functional integrals using coherent-state Slater determinants. Y.Avishai (Dept. of Phys., Ben Gurion Univ. of the Negev, Beer Sheva, Israel), J.Richert. *Phys. Rev. Lett. (USA)*, vol.50, no.16, p.1175-8 (18 April 1983). The feasibility of using Monte Carlo methods in finite fermion systems has been investigated. The basic tool is a (recently suggested) functional integral representation of $Z = \text{tr}[\exp(-\beta H)]$ using real coherent states of Slater determinants. Conditions for using the discretized (N -point lattice) version as a starting point for Monte Carlo integrations are studied. The limit of large β is achieved only with large \sqrt{N} . For a two-fermion system numerical calculations of the ground-state energy agree fairly well with the exact value. (21 refs.)

59676 Non-commutative martingales and stochastic integrals in Fock space. R.L.Hudson (Dept. of Math., Univ. of Nottingham, Nottingham, England), R.F.Streater. *Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981* (Berlin, Germany: Springer-Verlag 1982), p.216-22. Boson Fock space is used to construct some non-commutative martingales, and a definition of stochastic integrals based on exponential vectors is given. It is shown that Ito's formula reduces to the chain rule with Wick ordering. (4 refs.)

59677 Quantum dissipation and stochastic processes. R.Vilela Mendes (Inst. Nacional de Investigacao Cientifica, Lisboa, Portugal). *Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981* (Berlin, Germany: Springer-Verlag 1982), p.332-6. A general scheme to quantize dissipative and volume preserving dynamics is reviewed. The operator solutions of two examples are used to derive the stochastic differential equations obeyed by these processes. (7 refs.)

05.40 FLUCTUATION PHENOMENA, RANDOM PROCESSES, AND BROWNIAN MOTION

59678 Noise competition in a nonlinear system. I. Two independent noises. I.I.Fedchenia (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR), N.A.Usova. *Z. Phys. B (Germany)*, vol.50, no.3, p.263-7 (1983). A case of two independent noise sources influence on a locked oscillator phase is investigated. It is shown that they affect the system in an opposite way. Probability density, first passage times, $\langle \psi \rangle$ and $\langle \psi^2 \rangle$ are computed. (15 refs.)

59679 Quantum treatment of Brownian motion and influence of dissipation on diffusion in dynamically disordered systems. J.Heinrichs (Inst. de Phys., Univ. of Liege, Liege, Belgium). *Z. Phys. B (Germany)*, vol.50, no.3, p.269-73 (1983). The time-dependent hamiltonian formulation of the Langevin equation is used as a starting point for a quantum treatment of the motion of a free Brownian particle. From an exact solution of the time-dependent Schrodinger equation for the density-matrix in one dimension the author obtains the mean square displacement, $\langle x^2(t) \rangle$, of the Brownian particle, as well as the mean displacement induced by a uniform electric field $E(t)$. While quantum effects are significant for time intervals up to the frictional relaxation time, the long time results are identical to those obtained directly from the solution of the Langevin equation. Next, the author analyses in a similar way the motion of an electron in a dynamically disordered continuum where the effect of a classical friction force (dissipation) is taken into account. The friction effect is described using the phenomenological time-dependent hamiltonian inferred from the Langevin equation and the potential fluctuations are assumed to have a generalised gaussian white-noise form. The final result for $\langle x^2(t) \rangle$ shows a time-dependence similar to that obtained for the case of Brownian motion. (11 refs.)

59680 Scalar and vector laws of distribution of random quantities. V.F.Paramonov. *Izv. VUZ Mashinostr. (USSR)*, no.12, p.120-5 (1982). In Russian. Formulae are derived for the main theoretical laws of distribution of random quantities and their numerical characteristics in vectorial form, when a change is made from a one-parameter distribution to a two-parameter, or vectorial, distribution. The results can be used for theoretical and probabilistic analyses of vectorial dimensional chains, such as determination of overall pulsations, eccentricities and deviation of coordinate axes. (4 refs.) Z.F.V.

59681 Stochastic classical trajectory approach to relaxation phenomena. III. Comparison of trajectory results to quantum mechanical perturbation theory. A.Nitzan, J.C.Tully (Bell Labs, Murray Hill, NJ, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3959-63 (15 March 1983). For pt.II see *ibid.*, vol.69, p.2525 (1978). A simple model representing an impurity oscillator coupled anharmonically to a lattice is examined both by quantum mechanical perturbation theory and by stochastic classical trajectory simulations. Energy relaxation rates are computed as a function of temperature. Classical and quantum relaxation rates are found to agree well at high temperatures but, as expected, diverge drastically at low temperatures. If zero-point motion of the lattice is incorporated into the classical calculation, classical and quantum relaxation rates agree quite well for all temperatures, even for $T \rightarrow 0$. This suggests that the stochastic classical trajectory method can provide an accurate description of relaxation phenomena even at very low temperatures. (10 refs.)

59682 The power of chaos measured through the spectral analysis of experimental data. A.Lafon, A.Rossi, C.Vidal (Centre de Recherche Paul Pascal, Domaine Univ., Talence, France). *J. Phys. (France)*, vol.44, no.4, p.505-12 (April 1983). The authors investigate how far the power of chaos might be figured from the power spectrum of a dynamical regime. The numerical simulation of a model allows them to show that an entropy-like function H and the largest Lyapunov characteristic exponent λ both display nearby variations. Accordingly, they suggest one computes this H function, whenever λ cannot be determined. Since this is always the case when experimental time series are involved, a sequence of chaotic regimes exhibited by the Belousov-Zhabotinsky reaction is used to illustrate this point. (18 refs.)

59683 Error estimates of solutions and mean of solutions of stochastic differential systems. G.S.Laddes, M.Sambandham (Dept. of Math., Univ. of Texas, Arlington, TX, USA). *J. Math. Phys. (USA)*, vol.24, no.4, p.815-22 (April 1983). Stochastic differential equations are considered. Estimates in terms of statistical properties are given for the difference between the solutions and solutions of the mean of stochastic differential systems. For this purpose necessary theorems are developed and sufficient conditions are given to obtain error estimates. A few examples are worked out to demonstrate the usefulness of the results. (8 refs.)

59684 From classical dynamics to continuous time random walks. R.Zwanzig (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA). *J. Stat. Phys. (USA)*, vol.30, no.2, p.255-62 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). The migration of a classical dynamical system between regions of configuration space can be treated as a continuous time random walk between these regions. Derivation of a classical analog of the quantum mechanical generalized master equation provides expressions for the waiting time distribution in terms of transition memory functions. A short memory approximation to these memory functions is equivalent to the well-known transition state method. An example is discussed for which this approximation seems reasonable but is entirely wrong. (9 refs.)

59685 Stochastic flows, reaction-diffusion processes, and morphogenesis. J.J.Kozak, M.D.Hatlee, M.K.Musho, P.A.Politiowicz, C.A.Walsh (Dept. of Chem., Univ. of Notre Dame, Notre Dame, IN, USA). *J. Stat. Phys. (USA)*, vol.30, no.2, p.263-71 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). Recently, an exact procedure has been introduced (C.A. Walsh and J.J. Kozak, 1981) for calculating the expected walk length (n) for a walker undergoing random displacements on a finite or infinite (periodic) d -dimensional lattice with traps (reactive sites). The method (which is based on a classification of the symmetry of the sites surrounding the central deep trap and a coding of the fate of the random walker as it encounters a site of given symmetry) is applied here to several problems in lattice statistics for each of which exact results are presented. First, the authors assess the importance of lattice geometry in influencing the efficiency of reaction-diffusion processes in simple and multiple trap systems by reporting values of $\langle n \rangle$ for square (cubic) versus hexagonal lattices in $d=2, 3$. They then show how the method

may be applied to variable-step (distance-dependent) walks for a single walker on a given lattice and also demonstrate the calculation of the expected walk length (n) for the case of multiple walkers. Finally, they make contact with recent discussions of 'mixing' by showing that the degree of chaos associated with flows in certain lattice systems can be calibrated by monitoring the lattice walks induced by the Poincaré map of a certain parabolic function. (14 refs.)

59686 Fractal and lacunary stochastic processes. B.D.Hughes (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA), E.W.Montroll, M.F.Schlesinger.

J. Stat. Phys. (USA), vol.30, no.2, p.273-83 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

Discrete-time random walks simulate diffusion if the single-step probability density function (jump distribution) generating the walk is sufficiently short-ranged. In contrast, walks with long-ranged jump distributions simulate Levy or stable processes. A one-dimensional walk with a self-similar jump distribution (the Weierstrass random walk) and its higher-dimensional generalizations generate fractal trajectories if certain transience criteria are met and lead to simple analogs of deep results on the Hausdorff-Besicovitch dimension of stable processes. The Weierstrass random walk is lacunary (has gaps in the set of allowed steps) and its characteristic function is Weierstrass' nondifferentiable function. Other lacunary random walks with characteristic functions related to Riemann's zeta function and certain number-theoretic functions have very interesting analytic structure. (26 refs.)

59687 Nonexponential decay in relaxation phenomena. A.K.Rajagopal (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA), K.L.Ngai, R.W.Rendell, S.Teitler.

J. Stat. Phys. (USA), vol.30, no.2, p.285-92 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

A variety of considerations from different points of view including non-Markovian stochastic processes, basic quantum mechanics, and a mechanism based on condensed matter physics, all lead to the fractional exponential decay at long times in relaxation processes. Implications of this decay law and its verifiable predictions in a broad range of phenomena in condensed matter physics are pointed out. (16 refs.)

59688 Master equation techniques for exciton motion, relaxation, capture, and annihilation. V.M.Kenkre (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.293-303 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

Techniques developed recently for the study of exciton dynamics in molecular solids are discussed. They include master equation methods for the analysis of prerelaxation energy transfer, the generalized master equation approach to coherence in exciton motion, and the defect technique as applied to exciton trapping and annihilation. (31 refs.)

59689 Renormalization group approach to random walks on disordered lattices. J.Machta (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.305-14 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

One-dimensional random walks with static disorder are analyzed using a real space renormalization group procedure. The presence of disorder leads to a non-Markovian description of the macroscopic behavior of the random walk. The author considers random walks with nearest-neighbour hopping described by a master equation with both on-site and site-to-site disorder in the transition matrix. Site-to-site disorder leads to a generalized diffusion coefficient with a $t^{-3/2}$ long time tail whereas on-site disorder leads to a generalized Burnett coefficient with a $t^{-1/2}$ long time tail. (12 refs.)

59690 Theory of hopping and multiple-trapping transport in disordered systems. B.Movaghar (Hirst Res. Centre, GEC Res. Labs., Wembley, England), M.Gruneirwald, B.Pohlmann, D.Wurtz, W.Schirmacher.

J. Stat. Phys. (USA), vol.30, no.2, p.315-34 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

The authors present a general theory to describe equilibrium and nonequilibrium transport properties of systems in which the carriers perform an incoherent motion that can be described by means of a set of master equations. This includes hopping as well as trapping in the localized energy region of amorphous or perturbed crystalline semiconductors. Employing the mathematical analogy between the master equations and the tight binding problem they develop approximation schemes using methods of many-particle physics to derive expressions for the averaged propagator of the carriers and the conductivity tensor. The calculated conductivity and Hall conductivity of hopping systems compare extremely well to computer simulations over the whole range of frequency, density, and temperature. The authors find that in principle hopping can lead to dispersive transport if the times and densities are very low, but actual experimental data are more easily explained in terms of multiple trapping. (49 refs.)

59691 Single and multiple random walks on random lattices: excitation trapping and annihilation simulations. R.Kopelman, J.Hoshen, J.S.Newhouse (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA), P.Argyris.

J. Stat. Phys. (USA), vol.30, no.2, p.335-43 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

Random walk simulations of exciton trapping and annihilation on binary and ternary lattices are presented. Single walker visitation efficiencies for ordered and random binary lattices are compared. Interacting multiple random walkers on binary and ternary random lattices are presented in terms of trapping and annihilation efficiencies that are related to experimental observables. A master equation approach, based on Monte Carlo cluster distributions, results in a nonclassical power relationship between the exciton annihilation rate and the exciton density. (17 refs.)

59692 Trapping of excitation in the average T-matrix approximation. D.L.Huber (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.345-54 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

The author investigates the trapping of excitation by a random array of acceptor ions embedded in an assembly of donors. The problem is formulated in terms of coupled rate equations. Exact results for the fraction of excited donors are obtained in the zero and rapid donor-donor transfer limits for arbitrary ratios of the donor to trap concentration. The average T-matrix approximation (ATA) is introduced to interpolate between these limits in situations where the concentration of traps is much less than the concentration of donor ions. In three-dimensional systems the ATA reproduces the

results of earlier calculations in appropriate limits. The extension of the theory to higher trap concentration is discussed, as are problems connected with the application to one- and two-dimensional arrays. (26 refs.)

59693 Diffusion in random one-dimensional systems. J.Bernasconi, W.R.Schneider (Brown Boveri Res. Center, Baden, Switzerland).

J. Stat. Phys. (USA), vol.30, no.2, p.355-62 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

Diffusion on the one-dimensional lattice Z is described by a master equation with nearest-neighbour transfer rates (symmetric or asymmetric). The transfer rates associated with bonds are assumed to be independent, equally distributed random variables. Under various conditions on their common distribution the large time behaviour of averaged site probabilities and/or related quantities is exhibited. (9 refs.)

59694 Random walks on inhomogeneous lattices. P.W.Kasteleyn, W.T.F.den Hollander (Inst.-Lorentz voor Theoretische Natuurkunde, Univ. of Leiden, Leiden, Netherlands).

J. Stat. Phys. (USA), vol.30, no.2, p.363-72 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

For lattices with two kinds of points ('black' and 'white'), distributed according to a translation-invariant joint probability distribution, the authors study statistical properties of the sequence of consecutive colors encountered by a random walker moving through the lattice. The probability distribution for the single steps of the walk is considered to be independent of the colors of the points. Several exact results are presented which are valid in any number of dimensions and for arbitrary probability distributions for the coloring of the points and the steps of the walk. They are used to derive a few general properties of random walks on lattices containing traps. (10 refs.)

59695 Random walks on random lattices with traps. V.Halpern (Dept. of Phys., Bar-Ilan Univ., Ramat-Gan, Israel).

J. Stat. Phys. (USA), vol.30, no.2, p.373-81 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

A critical examination is presented of the continuous time random walk (CTRW) approximation and of frequency-dependent effective transition rate methods for calculating the configurational average of the Laplace transform of the probability $P(s,t|s_0)$ that a particle performing a random walk will be at site s time t after it reached the site s_0 . Some exact results are derived for the form of $P(s,t|s_0)$ at long times, and these indicate that the effective transition rate methods are the better approximation for systems with symmetric effective hopping rates, while the CTRW approximation is better for systems containing traps, i.e., states that are much easier to enter than to leave. The implications of these results for calculations of transient currents and of the AC conductivity for amorphous semiconductors are discussed. (22 refs.)

59696 Diffusion-controlled reactions among stationary sinks. R.I.Cukier (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.383-9 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

The author summarizes results of some calculations in diffusion-controlled reaction theory. He derives the transport equation describing a diffusing species which can react with a set of randomly distributed spherical sinks. Both the form of the transport equation and the dependence on sink volume fraction of the reaction rate and the effective diffusion coefficient are discussed. (9 refs.)

59697 From random to self-avoiding walks. C.Domb (Dept. of Phys., Bar-Ilan Univ., Ramat-Gan, Israel).

J. Stat. Phys. (USA), vol.30, no.2, p.425-36 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

A brief review is given of the current situation in the theory of self-avoiding walks. The Domb-Joyce model consists of a random walk on a lattice in which each N step configuration has a weighting factor $\prod_{i=0}^{N-1} (1 - \omega_{ij})$. Here i and j are the lattice sites occupied by the i th and j th points of the walk. When $\omega=0$ the model reduces to a standard random walk, and when $\omega=1$ it is a self-avoiding walk. The universality hypothesis of critical phenomena is used to conjecture the behavior of the model as a function of ω for large N . The implications for the theory of dilute polymer solutions is indicated. (20 refs.)

59698 Renormalization group description of polymer excluded volume. K.F.Freed (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA), A.L.Kholodenko.

J. Stat. Phys. (USA), vol.30, no.2, p.437-47 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

A description is provided of the chain conformation space renormalization group approach to the treatment of polymer excluded volume. This method is transformed into one of identical form to the t'Hooft-Veltman renormalization method of field theory, thereby enabling comparison with other methods. A summary is provided of recent new results obtained by this technique for the full second-order dependence of the mean square end-to-end distance (R^2) on chain length and excluded volume as well as a calculation of $\langle R^2 \rangle$ for a polyelectrolyte chain with added salt. (21 refs.)

59699 Self-avoiding walks with geometrical constraints. S.G.Whittington (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).

J. Stat. Phys. (USA), vol.30, no.2, p.449-56 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

The author considers self-avoiding walks on a D -dimensional hypercubic lattice, confined to a slab geometry and confined to a half-space. The author presents a proof of the existence of a 'connective constant' for the slab geometry and reviews some corresponding results for the half-space. The way in which scaling arguments can be used to give stronger, but nonrigorous, results is also discussed. (21 refs.)

59700 Monte Carlo renormalization group calculations for polymers. M.Muthukumar (Dept. of Chem., Illinois Inst. of Technol., Chicago, IL, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.457-65 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

A simple method based on Wilson's renormalization group ideas is applied to calculate the dynamical critical exponent z for polymer chains in different dynamical regimes. The Doi-Edwards reptating chain does not belong to the same dynamical universality class as the Rouse chain. The earlier results based on $\epsilon(4-d, d \sim \text{space dimensionality})$ expansion for chains with excluded volume effect are recovered without any ϵ expansion. When com-

bined with the Monte Carlo techniques, this method results in a simple scheme for calculating the static and dynamic exponents for a polymer chain with a prescribed dynamics. Numerical results suggest that the slithering snake model of Wall and Mandel (1975) for the dynamics is in a different dynamic universality class than the Rouse chain. (13 refs.)

59701 On Pearson's random walk and some statistical properties of a quasiperiodic observable in a simple quantum model. F.T.Hioe (Dept. of Phys., St. John Fisher Coll., Rochester, NY, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.467-75 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). The dynamics of the atomic inversion of a quantum model of field-atom interaction is studied from a statistical point of view. The author determines its mean motion and its partial recurrence frequencies. The mathematical analysis used by Lagrange, Wintner, and Weyl in their pioneering studies of the perturbed planetary motion and its connection with the studies of Pearson's random walks are employed. (19 refs.)

59702 Energy transfer as a random walk with long-range steps. A.Blumen, G.Zumofen (Lehrstuhl für Theoretische Chemie, Tech. Univ. München, Garching, Germany).

J. Stat. Phys. (USA), vol.30, no.2, p.487-95 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). The authors consider the incoherent energy transport in molecular crystals, where the transfer rates stem from Coulombic and exchange interactions. For substitutionally disordered lattices they present in a first passage model the excitation decay due to trapping by randomly distributed traps; the decay is related to the distribution of the number of distinct sites visited during the time t and is expressible through the cumulants of this distribution. The validity domains of approximate decay laws based on the first few cumulants are also discussed. The authors exemplify the findings for dipolar transfer rates between randomly distributed molecules on a square lattice, by comparing the random walk on the random system to its CTRW (continuous time random walk) counterpart. (17 refs.)

59703 Random walk to and interaction with an impurity. P.M.Richards (Sandia Nat. Labs., Albuquerque, NM, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.497-507 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). A random walker tagged with a spin may conveniently be studied by small amounts of paramagnetic impurities which significantly affect the spin relaxation at concentrations as low as a few parts per million. Examples are found in nuclear magnetic resonance (NMR) and muon spin rotation (μ SR). At low temperature relaxation is determined by the time for the walker to reach an impurity, and thus the impurity acts like a simple trap. Details of the interaction with the impurity are important at higher temperatures, and the relaxation rate is shown to go through a maximum because of this. Special features associated with many returns to the origin, particularly important in one-dimensional walks, and the difference between incoherent (rapidly fluctuating paramagnetic spin) and coherent (stationary paramagnetic spin) returns are discussed. (13 refs.)

59704 Diffusion in concentrated lattice gases. K.W.Kehr (Inst. für Festkörperforschung, KFA, Jülich, Jülich, Germany).

J. Stat. Phys. (USA), vol.30, no.2, p.509-18 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). The diffusion of many particles on a lattice is an example of a correlated random-walk process. Recently the waiting-time distributions for two consecutive jumps of a tagged particle have been determined numerically and the time-dependent correlations analyzed in detail. The information over these two consecutive jumps is used to determine the position and velocity autocorrelation functions, and very satisfactory results are obtained for three-dimensional lattices. However, the information of the two consecutive jumps is insufficient when the jump rate of the tagged particle is large compared to that of the other particles, and this approximation fails completely in one dimension. For the linear chain, another approximation which accounts for correlation over all jumps is compared with the numerical simulations. (18 refs.)

59705 Stochastic processes originating in deterministic microscopic dynamics. D.Durr, S.Goldstein, J.L.Lebowitz (Dept. of Math., Rutgers Univ., New Brunswick, NJ, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.519-26 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). The authors investigate the probability distribution of the scaled trajectory of a test particle moving in an equilibrium fluid according to the laws of classical mechanics, i.e. if $Q(t)$ is the displacement of the test particle they let $Q_A(t) = Q(t)/\sqrt{A}$ and consider the distribution of the trajectory $Q_A(t)$ in the limit $A \rightarrow \infty$. The randomness of the motion is due entirely to the randomness of the initial state of the fluid, test particle, or both, and the process is generally non-Markovian. Nevertheless, it can be proven in some cases and the authors expect it to be true in many more than $Q_A(t)$ looks like Brownian motion in the limit $A \rightarrow \infty$. Some results for simple model systems are presented. (13 refs.)

59706 Kinetics of adsorption on stepped surfaces and the determination of surface diffusion constants. C.H.Wu (RCA Labs., Princeton, NJ, USA), E.W.Montroll.

J. Stat. Phys. (USA), vol.30, no.2, p.537-47 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). Nitrogen adsorption on stepped W(110) surfaces is examined to illustrate a theory of surface kinetics. Experimental findings by Besocke et al. (1979) have shown that nitrogen chemisorbs dissociatively only at the step corner sites of a W(110) surface. Thus the rate of dissociation reveals the mobility of nitrogen and its interaction with the surface. Using continuous-time-random-walk theory, the authors obtain the probability that molecules reach the step corner sites as a function of time. A kinetic model of nitrogen dissociation is proposed to calculate a coverage function that is in good agreement with experiment. The surface diffusion constant of nitrogen molecules is obtained and is in accordance with previous observations that nitrogen molecules are first weakly physisorbed on the W(110) terrace. Finally, the coverage functions for different step densities are predicted. (16 refs.)

59707 Equilibrium folding pathways for model proteins. S.Miyazawa, R.L.Jernigan (Lab. of Math. Biology, Nat. Inst. of Health, Bethesda, MD, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.549-59 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). Protein conformations have been generated with both a Monte Carlo scheme and a simpler two-state noninteracting globule-coil model. To describe probable folding pathways, either energy or the number of native residues are employed as simple one-dimensional folding-unfolding coordinates. By considering only conformations at each point on these coordinates, it is possible to obtain detailed conformational descriptions of relatively rare intermediates on the folding pathway. Equilibrium folding-unfolding pathways have been constructed by connecting most probable conformations in order along the folding coordinate. Calculations with the noninteracting globule-coil model have been performed with details chosen to correspond to those in the Monte Carlo calculation for pancreatic trypsin inhibitor. (15 refs.)

59708 Momentum from sample paths in stochastic mechanics. D.de Falco, S.de Martino, S.de Siena (Istituto di Fisica, Facoltà di Scienze, Univ. di Salerno, Salerno, Italy).

Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.14, p.457-60 (2 April 1983). According to Shucker's analysis (1978, 80), quantum-mechanical momentum can be read from the asymptotic behaviour of Nelson's sample paths. The authors use the position-momentum-uncertainty product as a measure of the rate of approach to the large time asymptotics. (4 refs.)

59709 Mostly chaos. B.A.Huberman (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).

Physica A (Netherlands), vol.118A, no.1-3, p.323-8 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Summarizes the author's work in the field of deterministic chaos in condensed matter, the universal properties that the author has found, and the interplay between external fluctuations and the intrinsic chaotic dynamics of nonlinear deterministic equations. This latter aspect has also led to a strong analogy between the onset of chaotic behavior and critical phenomena in phase transitions. The author starts by describing work on a problem that is quite pervasive in condensed matter physics, i.e. that of the dynamics of particles in anharmonic potentials when subjected to a time periodic external field. Although there exists a vast literature on the subject, its reliance on perturbative methods prevented the discovery of very unusual effects which are associated with the global properties of the solutions. (19 refs.)

59710 The description of catastrophic changes in tagged particle dynamics by the self-consistent repeated ring equation. T.Keyes, A.J.Masters (Sterling Chem. Lab., New Haven, CT, USA).

Physica A (Netherlands), vol.118A, no.1-3, p.395-406 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

The nature of tagged particle motion in random media can change catastrophically as some parameter, most notably the scattered density, is varied. In some systems, the self-diffusion constant vanishes above a critical density, providing a dynamic analog of the static percolation problem. Good theoretical treatments of these phenomena are given by solutions of the nonlinear equations generated by the 'self-consistent repeating ring' approximation. The authors work out the repeated ring approximation for three systems: a random walk on a lattice where randomly chosen are excluded to the walker, the Lorentz gas, and the motion of a light particle in a real fluid. (9 refs.)

59711 A one-dimensional-map model for noise-induced transitions between bistable states. E.A.Celariar, S.Fraser, R.Kapral (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.247-50 (21 March 1983). Noise-induced transition processes involving bistable states of far-from-equilibrium systems are studied in terms of a one-dimensional-map model of the dynamics. The simplicity of the map model permits the mechanisms of these transition phenomena to be examined in some detail. (9 refs.)

59712 Diagram technique for calculating long-wave fluctuation effects. I.M.Khalatnikov, V.V.Lebedev, A.I.Sukhorukov (L.D. Landau Inst. for Theoretical Phys., Acad. of Sci., USSR).

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.271-4 (21 March 1983). The contribution of long-wave fluctuations to macroscopic equations of the hydrodynamical type is studied. The generating functional, enabling one to formulate the standard technique of Feynman diagrams for calculating the fluctuation interaction higher-order effects, is found. It is shown that in the second order of the perturbation theory the diagram technique is equivalent to the kinetic equation for the fluctuation distribution function. (10 refs.)

59713 Correlation time expansion for non-Markovian, Gaussian, stochastic processes. R.F.Fox (School of Phys., Georgia Inst. of Technol., Atlanta, GA, USA).

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.281-6 (21 March 1983). Ordered operator cumulants and van Kampen's lemma are used to obtain a correlation time expansion for colored noise, stochastic processes. An explicit result to first order in the correlation time is obtained, and confirms the result of Dekker (1982) obtained by application of Novikov's theorem. The operator cumulant approach is much more direct, systematically yielding the desired result, and systematically provided any higher order correction. The origin of each explicit order of correction is accounted for in a natural manner in terms of the cluster property for ordered operator cumulants. (11 refs.)

59714 Path integrals for non-Markovian processes. L.Pesquera, M.A.Rodriguez, E.Santos (Dept. de Física Teórica, Univ. de Santander, Santander, Spain).

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.287-9 (21 March 1983). The authors obtain a path-integral expression for the conditional probability density of a system submitted to a non-white noise: the Ornstein-Uhlenbeck noise. In this case the function that corresponds to the Onsager-Machlup potential is no longer similar to a Lagrangian due to the non-markovian character of the system. (6 refs.)

59715 Stability theory of synchronized motion in coupled-oscillator systems. H.Fujisaka (Dept. of Phys., Kagoshima Univ., Kagoshima, Japan), T.Yamada.

Prog. Theor. Phys. (Japan), vol.69, no.1, p.32-47 (Jan. 1983). The general stability theory of the synchronized motions of the coupled-oscillator systems is developed with the use of the extended Lyapunov matrix approach. The authors give the explicit formula for a stability parameter of the synchronized state Ψ_{sync} . When the coupling strength is weakened, the coupled system may exhibit several types of non-synchronized motion. In particular, if Ψ_{sync} is chaotic, they always get a transition from chaotic Ψ_{sync} to a certain non-uniform state and finally the non-uniform chaos. Details associated with such transition are investigated for the coupled Lorenz model. As

an application of the theory, they propose a new experimental method to directly measure the positive Lyapunov exponent of intrinsic chaos in reaction systems. (13 refs.)

59716 Intermittency associated with the breakdown of the chaos symmetry. H.Fujisaka, H.Kamifukumoto, M.Inoue (Dept. of Phys., Kagoshima Univ., Kagoshima, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.333-7 (Jan. 1983).

The intermittency transition associated with the breakdown of the chaos symmetry in one-dimensional dynamics is studied in connection with the Pomeau-Manneville (1979, 1980) intermittency transition. The strong trajectory instability, which is present even in 'laminar' phases, renders a derivation of probabilistic laws possible. (8 refs.)

59717 One-time characteristic functional in the stochastic quantization.

Y.Nakano (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.361-5 (Jan. 1983).

The author presents a proof for the equivalence between the stochastic quantization and the ordinary one using one-time characteristic functional. It is shown that one cannot apply the scheme to the gauge theories unless one introduces an infinitesimal parameter which assures the relaxation of the stochastic process. (13 refs.)

59718 Coherent spatial structure versus time chaos in a perturbed sine-Gordon system. A.R.Bishop, K.Fesser, P.S.Lomdahl (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), W.C.Kerr, M.B.Williams, S.E.Trullinger.

Phys. Rev. Lett. (USA), vol.50, no.15, p.1095-8 (11 April 1983).

A novel interplay of coherent spatial structure and temporal chaos is reported for the AC driven, damped sine-Gordon system with breather initial conditions and periodic boundary conditions. The competing tendencies of spatial structures to be stable and of single-particle motions to be chaotic can lead to suppression of chaos, spatio-temporal intermittency, and symmetry-breaking tendencies. Dynamic structure factors provide direct evidence for spatial period halving and renormalized-phonon generation in chaotic regimes. (12 refs.)

59719 Dynamical systems with few degrees of freedom. P.Collet (Centre de Phys. Theorique, Ecole Polytech., Palaiseau, France).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.29-39

Discusses initially stable systems in which a series of bifurcations take place, the behaviour becomes more complicated and eventually a chaotic state is reached. Routes to turbulence that result from generic bifurcations are described, together with the period doubling route to turbulence. Some remarks about the turbulent behaviour of simple systems are given. (30 refs.)

59720 Periodic orbits of dynamical systems with chaotic behavior. S.De Gregorio (Istituto di Matematica, Univ. di Roma, Roma, Italy), E.Scoppola, B.Tirozzi.

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.67-74

Explains the method by which the authors have used a modified version of Sinai and Vul's (1980) method to study closed orbits that appear in the Lorenz model and in the five modes model. (4 refs.)

59721 All that Brownian motion. D.Durr (Inst. fur Math., Ruhr-Univ. Bochum, Bochum, W.Germany).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.119-35

Presents some recent results in the mathematical rigorous study of nonequilibrium statistical mechanics. These results have been obtained in collaboration with S. Goldstein and J.L. Lebowitz. (9 refs.)

59722 On the statistical mechanics of surfaces. J.Frohlich (IHES, Bures-sur-Yvette, France), C.E.Pfister, T.Spencer.

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.169-99

Briefly reviews some rigorous results concerning random surfaces and interfaces. Discussed are the interface in the three-dimensional Ising- and rotator model; the solid-on-solid model; self-avoiding random surfaces and string theories; lattice gauge theories. (33 refs.)

59723 A note on irreducibility and ergodicity of symmetric Markov processes. M.Fukushima (Coll. of General Education, Osaka Univ., Osaka, Japan).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.200-7

Gives some theorems, proofs, corollaries and remarks concerning ergodicity and irreducibility in symmetric Markov processes. (6 refs.)

59724 Stochastic processes in music and art. J.C.Risset (Lab. de Mecanique et d'Acoustique, CNRS, Marseille, France).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.281-8

Describes some examples of music and visual art based on stochastic processes. Musical works in which randomness is used to determine the choice of note etc. are discussed, and a review is given of information theory in the analysis of music. Random processes in visual arts are also included, emphasising work by Julesz and Noll. (50 refs.)

05.50 LATTICE THEORY AND STATISTICS; ISING PROBLEMS

(see also 75.10H Ising models)

59725 A number of the permissible phases for Ising lattice. Liu Jian-min, Gong Chang-de (Dept. of Phys., Nanjing Univ., Nanjing, China).

Commun. Theor. Phys. (China), vol.2, no.1, p.909-11 (1983).

The catastrophe theory is applied to investigating the number of permissible phases for homogeneous-isotropic and homogeneous-anisotropic Ising lattices. (10 refs.)

59726 Electron localization in a finite one-dimensional chain. K.Tanaka, M.Nagaoka, T.Yamabe (Dept. of Hydrocarbon Chem., Kyoto Univ., Kyoto, Japan).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.1101-9 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The localization characteristics of the electronic wave functions in a finite one-dimensional chain with the diagonal or the off-diagonal disorder of the potentials have been studied. It has been shown that the eigenfunction at the frontier level is relatively 'strong' against the temptation to localize caused by the existence of the random potentials. It has also been pointed out that the spatial behavior of the total density reflects that of the diagonal random potentials, but that under the off-diagonal random potentials the total density is spatially uniform (completely extended). (19 refs.)

59727 Further comments concerning large amplitude motion in an anharmonic chain with nearest neighbor interactions. S.Bradlow, M.A.Collins, S.A.Rice (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3344-5 (15 March 1983).

For original paper see Collins and Rice, *ibid.*, vol.77, no.5, p.2607 (1982). In a recent paper Collins and Rice analyzed the semiclassical dynamics of large amplitude motion in a one-dimensional anharmonic atomic lattice with periodic boundary conditions. Their investigation of the perfectly periodic vibrational modes of the chain yielded a surprising result: they found that while the anharmonicity in the potential greatly influenced the shapes of the vibrational modes, it had very little effect on their energies. Collins and Rice, however, calculated the eigenstate energies only for the ground and first excited states of the periodic modes. Because their findings are so striking, the authors have extended their investigation and have examined the effect of the anharmonicity in the potential on mode shape and energy for small k modes up to the fifth excited state. (1 ref.)

59728 Mean-field renormalisation group transformations for geometric phase transitions. K.De'Bell (Dept. of Phys., Dalhousie Univ., Halifax, Nova Scotia, Canada).

J. Phys. A (GB), vol.16, no.6, p.1279-87 (21 April 1983).

It is shown that the mean-field renormalisation group technique of Indekeu et al. (1982) may be applied directly to the self-avoiding walk (SAW) and percolation problems (without reference to the $n \rightarrow 0$ limit of interacting spin systems). Numerical results for the SAW and bond and site percolation (both directed and undirected) problems on the square lattice, obtained by using a variety of small cells, are reported. An isotropic transformation for the percolation problems on the d -dimensional hypercubic lattice is also discussed. (21 refs.)

59729 Two-dimensional iterated mapping for the mean-field theory of the chiral Potts model. H.C.Ottinger (Fakultat fur Phys., Univ. Freiburg, Freiburg, Germany).

J. Phys. C (GB), vol.16, no.10, p.L257-63 (10 April 1983).

It is shown how the solution of the mean-field equations for the chiral Potts model can be reduced to the iteration of an area-preserving two-dimensional mapping. By this method a variety of modulated magnetic phases can be observed. (10 refs.)

59730 Complete devil's staircase in the one-dimensional lattice gas. Comment on 'One-dimensional lattice gas and the universality of the devil's staircase' by S.E. Burkov. S.Aubry (Lab. Leon Brillouin, CEN Saclay, Gif-sur-Yvette, France).

J. Phys. Lett. (France), vol.44, no.7, p.L247-50 (1 April 1983).

The author calculates explicitly the exact form of the complete devil's staircase for the lattice gas model. Thus, it is shown that the behaviour at the commensurate-incommensurate phase transition essentially depends on the long distance interactions. The author questions the assertion of Burkov (see *ibid.*, vol.44, p.L179, 1983) about the universality properties of the devil's staircase. (10 refs.)

59731 Bond-site percolation in 2D packings. D.Bideau, J.P.Troadec, L.Oger (Univ. de Rennes 1, Rennes, France).

J. Phys. Lett. (France), vol.44, no.8, p.L279-83 (15 April 1983). In French.

Considers the problem of site-bond percolation on a triangular lattice modeling a 2D random mixture of discs, an inactive bond corresponding to a lack of contact between two neighbour discs. For a regular triangular lattice a hypothesis about conduction of a cell of the direct lattice and of a cell of the 'rival' one permits the authors to propose some results about percolation three-

sholds and critical lines in good agreement with the known exact results and results of numerical simulations. (19 refs.)

59732 Statistical mechanics of one-dimensional XYZ spin chain, massive Thirring model and quantum sine-Gordon system. M.Imada (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), K.Hida, M.Ishikawa. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1221-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The specific heat is calculated in the massive Thirring/quantum sine-Gordon limit on the one-dimensional XYZ model with the help of the Bethe ansatz approach. The Schottky-type anomaly appears as a contribution from the quantum soliton. The finite-temperature excitations are also discussed for these models. (13 refs.)

59733 Path-integral approach to a finite many-body problem. H.Grinberg, J.Maranon (Dept. de Física, Facultad de Ciencias Exactas, Univ. Nacional de La Plata, La Plata, Argentina). *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.275-80 (21 March 1983). The Feynman path integral is used to show the equivalence between a finite many-body problem (Huckel model) for a nonrelativistic and nonspin molecular system of N electrons and N one-dimensional Ising models. (7 refs.)

59734 Phase transition and fractals. M.Suzuki (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.65-76 (Jan. 1983).

A geometrical interpretation of critical phenomena, particularly of the scaling relations on critical exponents, is given by the use of statistical fractal dimensionality. The relation between this geometrical interpretation and the finite size scaling theory is also discussed. The concept of connectivity dimensionality (or generalized fractal topological dimensionality) is introduced to discuss the relation between critical exponents and fractal dimensionalities of some explicit lattices. (19 refs.)

59735 A comment on the theory of excitation migration in disordered lattices. J.Klafter (Corporate Res. Sci. Lab., EXXON Res. & Engng. Co., Linden, NJ, USA), R.Silbey. *Philos. Mag. B (GB)*, vol.47, no.3, p.337-41 (March 1983).

The transport of an excitation on a lattice randomly occupied by guests is considered, emphasizing the dependence on the initial condition. Exact equations are derived for the transport, which can be written as a generalized master equation or as a continuous-time random-walk equation. (6 refs.)

59736 Eigenvalues of two-dimensional harmonic systems with periodic structures. C.C.Shih (Dept. of Phys. & Astron., Univ. of Tennessee, Knoxville, TN, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3287-302 (15 March 1983).

A recent technique of amplitude analysis for one-dimensional systems is generalized to a class of two-dimensional harmonic systems with nearest-neighbor interaction and periodic structures. The characteristic equation for the eigenvalues is reduced to a set of polynomial equations of order equal to the number of particles in the unit cell for finite and infinite crystals. Most of the analytic solutions demonstrated cannot be readily obtained by other methods. Numerical examples of precise eigenvalues and eigenvectors for some large but finite lattices (15×12 , 15×21) can also be evaluated very accurately and efficiently. Analytic and numerical examples of several infinite strips are presented using both the fixed-end and cyclic-boundary conditions. (13 refs.)

59737 Effect on spin variables and exciton motion on ground-state properties of the 'trion'. R.Schilling, D.C.Mattis (Dept. of Phys., Univ. of Utah, Salt Lake City, UT, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3318-24 (15 March 1983).

Solves a quantum three-body problem involving two holes and a single electron ('trion') in a two-band Hubbard model. The particles' spin and the exciton hopping matrix element are all included. The authors compare the results with those of a previous paper, in which these additional complications were absent, and find broad agreement. There is one novelty: the trion with single holes is always mobile, even in one dimension. (6 refs.)

59738 Critical behavior of the anisotropic n -vector model, self-avoiding rings, and polymerization. P.D.Gujrati (James Franck Inst., Univ. of Chicago, Chicago, IL, USA). *Phys. Rev. B (USA)*, vol.27, no.7, p.4507-10 (1 April 1983).

The author studies the critical behavior of the m -anisotropic n -vector model with n and m both as continuous variables [$0 \leq n, m < 4 - O(\epsilon)$, $\epsilon = 4 - d$, d = dimensionality of space] to first order in ϵ . The limit $n \rightarrow 0$, $m > 0$ of the model is of interest as a model of self-avoiding rings and of polymerization. For $n \geq m$, n, m integers, the critical behavior of the model is known to be that of the isotropic m -vector model, i.e. the $O(m)$ model. Here he proves that the critical behavior of the anisotropic model is always identical with that of the $O(m)$ model for real n, m regardless of whether $n \geq m$ or $n < m$. In particular, he proves that a single self-avoiding ring and a single self-avoiding walk belong to the same universality class of the $O(0)$ model, while polymerization belongs to the universality class of the $O(m)$ model, $m > 0$. (11 refs.)

59739 Some results on the spectra of random Schrodinger operators and their application to random point interaction models in one and three dimensions. W.Kirsch, F.Martinelli (Inst. für Math., Ruhr-Univ. Bochum, Bochum, Germany).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.223-44

Schrodinger operators with a random potential occur naturally in the theory of alloys, liquids, solids with impurities and amorphous materials. Several results are given concerning the spectra of random Schrodinger operators H_ω of the form: $H_\omega = H_0 + V_\omega$ on $L^2(\mathbb{R}^d)$ $H_0 = -\Delta$ being the Laplacian and V_ω a function or a quadratic form which depends on ω , a point in a probability space (Ω, \mathcal{F}, P) . In most considerations V_ω is taken as the total potential acting on the quantum particle generated by 'heavy' particles of random 'charges' $q_i(\omega)$ located at the random positions $\xi_i(\omega)$. (32 refs.)

59740 Existence of a first-order phase transition for the Potts model. R.Kotecky (Dept. of Math. Phys., Charles Univ., Povolavka, Praha, Czechoslovakia), S.B.Slosman.

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.248-53

Sketches a proof that for many-state Potts model an expected discontinuity of the average energy as a function of temperature really occurs. The presentation is based on previous work by the authors, though they give an alternative proof of one part of the statement. (8 refs.)

59741 Large scale behavior of equilibrium time correlation functions for some stochastic Ising models. H.Spohn (Dept. of Math., Rutgers Univ., New Brunswick, NJ, USA).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.304-31

Reviews recent rigorous results and an argument, which proves the exponential decay of correlation functions in space-time for a class of stochastic Ising models at high temperature. Brief outlooks are given on the hydrodynamics of stochastic lattice gases and on linearized hydrodynamics for fluids. (25 refs.)

05.60 TRANSPORT PROCESSES: THEORY

59742 Transport factors in dense media. E.G.Aznakaev. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.2, p.44-6 (1983). In Ukrainian.

Kinetic theory methods are applied to discuss processes of mass, momentum and energy transfer in dense continua. Expressions for the transport factors are derived and the author discusses mass, momentum and energy conservation laws. The equation of state is presented and hydrodynamic equations are considered. (3 refs.)

59743 On maximum principles for diffusion in the presence of three diffusion paths. A.I.Lee, J.M.Hill (Dept. of Math., Univ. of Wollongong, Wollongong, NSW, Australia). *J. Aust. Math. Soc. Ser. B (Australia)*, vol.24, pt.4, p.417-23 (April 1983).

Examines maximum principles for systems of parabolic partial differential equations. The particular system under consideration arises from a random walk model. For a more general system, constraints on the various constants are given which guarantee maximum principles. Remarkably, the physical system arising from the random walk model automatically satisfies these constraints. (13 refs.)

59744 The long time tail conundrum in nonequilibrium statistical mechanics. R.F.Fox (School of Phys., Georgia Inst. of Technol., Atlanta, GA, USA). *Physica A (Netherlands)*, vol.118A, no.1-3, p.383-94 (March 1983).

(Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

The existence and significance of long time tails in diffusion processes is discussed from the viewpoints of computer simulation, theory, and experiments. It is argued that the understanding of this phenomenon is not satisfactory for each of these three points of view. (32 refs.)

59745 Large time solution of an inhomogeneous nonlinear diffusion equation. R.E.Gundy (Math. Inst., Univ. of St. Andrews, St. Andrews, Scotland). *Proc. R. Soc. London Ser. A (GB)*, vol.386, no.1791, p.347-72 (8 April 1983).

The paper considers the large time solution of the nonlinear diffusion equation $\rho(x,t)\partial_t u = \partial/\partial x(C(x)u^\beta\partial_x u)$, $\beta > 0$, for initial data with compact support. The asymptotic behaviour of $\rho(x)$ and $C(x)$ as $|x| \rightarrow \infty$ defines a parameter space, and the nature of the solution at large time depends crucially on the location therein. The author examines the nature and uniformity of the asymptotic solutions for $x \in (-x_0, x_0)$ in a restricted region of the entire parameter space, and in certain cases gives the leading error terms. A new integral invariant of the solution is also given. (21 refs.)

59746 The diffusion equation and classical mechanics: an elementary formula. K.D.Elworthy (Inst. of Maths., Univ. of Warwick, Coventry, England), A.Truman.
Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.136-46
Let M be an n -dimensional Riemannian manifold and Δ its Laplace-Beltrami operator. The authors examine the limiting behaviour as $\mu \rightarrow 0$ of the diffusion equation $\partial g_\mu/\partial t = \mu^2/2 + Vg_\mu/\mu^2$ $0 \leq t \leq \infty$ $g_0(x) = T_0(x) \exp[4S_0(x)/\mu^2]$ for $g_\mu: M \rightarrow R$, given $T_0: M \rightarrow R$ and $S_0: M \rightarrow R$. Using the Girsanov formula the authors obtain an exact path integral expression for the minimal solution g_μ to the equation, which shows clearly how the solution behaves in relation to its WKB approximation. It is valid up to the time when caustics appear, if they do, and requires some smoothness conditions on V , S_0 and T_0 . Also given is the first 'post WKB' term when $T_0 \equiv 1$. Also mentioned are some further developments, in particular indicating how to obtain an exact expression for the propagator for a restricted class of manifolds. (20 refs.)

59747 Hopping transport in disordered one-dimensional lattice systems: random walk in a random medium. W.R.Schneider (Brown Boveri Res. Center, Baden, Switzerland).
Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.289-303
The formalism for a particle moving stochastically on a lattice is extended to introduce disorder to the medium. This is achieved by assuming that transfer rates are random. Finite size effects are studied and the large L behaviour of the static diffusion function is discussed. (7 refs.)

05.70 THERMODYNAMICS

(see also 44.60 Thermodynamic processes, 64. Equations of state, phase equilibria and phase transitions, 65. Thermal properties of condensed matter; for chemical thermodynamics, see 82.60)

59748 A note on the use of different representations of excess-energies in ternary systems. J.Agren (ManLabs Inc., Cambridge, MA, USA).
CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB), vol.6, no.4, p.279-81 (1982).
It is pointed out that there really is a physical arbitrariness in the Kohler method that underlies the singularity. The Kohler method as applied, by Kaufman for example, to the subregular solution yields a contribution to the total excess-energy from the binary A-B system, $E_{AB} = X_A X_B L_{AB}$, where L_{AB} is the interchange energy. This is also the type of contribution one obtains in a random solution by counting the number of nearest neighbours. As long as L_{AB} is constant there are no problems. When L_{AB} , i.e. the bonding energy between A and B atoms, varies with composition, and this variation is known as the binary case but not in the ternary, the question arises which value one should choose in a ternary solution. (5 refs.)

59749 Critical point shifts in films. H.Nakanishi, M.E.Fisher (Baker Lab., Cornell Univ., Ithaca, NY, USA).
J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3279-93 (15 March 1983).
Critical behavior in thin films is discussed with attention to the example of phase separation in binary fluid mixtures between parallel plates. The analyses focus on the dependence of the shift in critical temperature ΔT_c , critical field, etc., on the film thickness D , and on the nature of the walls as modeled by a surface field or chemical potential h_1 which acts near the walls and leads to preferential adsorption of one of the bulk phases. Mean field theory for an Ising/lattice-gas model is utilized and the resulting asymptotic scaling functions for the shifts ΔT_c , etc., are computed within Landau theory by analytic and numerical methods. Series analyses for simple cubic lattice Ising model films with $h_1 = 0$ are used to estimate universal features of three-dimensional systems specifically, if $\xi(\Delta T)$ is the bulk correlation length, determined, say, via scattering experiments, at $\Delta T = T - T_c^\infty > 0$ then the shift ratio $D/\xi(\Delta T_c)$ is about 2.89 for $h_1 = 0$ but 4.61 for $h_1 \rightarrow \infty$, compared with mean field values π and 5.0699. Crossover effects for small nonzero h_1 may lead to 10%-15% errors in estimating the exponent for the decay of ΔT_c with D . The relation of the theory to recent experiments and the connection with wetting phenomena are discussed briefly. (30 refs.)

59750 The effective conductivity of a periodic array of spheres. A.S.Sangani, A.Acrivros (Dept. of Chem. Engng., Stanford Univ., Stanford, CA, USA).
Proc. R. Soc. London Ser. A (GB), vol.386, no.1791, p.263-75 (8 April 1983).
The authors consider the problem of determining the effective conductivity k^* of a composite material consisting of equal-sized spheres of conductivity k^* arranged in a cubic array within a homogeneous matrix of unit conductivity. They modify Zuzovskii & Brenner's (1977) method and thereby obtain a set of infinite linear equations for the coefficients of the formal solution equivalent to that derived by McKenzie et al. (1978) using a method originally devised by Rayleigh (1892). On solving these equations they derive expressions for k^* to $O(\epsilon^2)$, (ϵ being the volume fraction of the spheres) for simple, body-centred and face-centred cubic arrays, and also obtain numerical values for k^* over the whole range of α and c . They show that these results for cubic arrays can be used to estimate k^* for random arrays of identical spheres. (29 refs.)

59751 Renormalization group and linear integral equations. W.Klein (Dept. of Phys., Boston Univ., Boston, MA, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4475-8 (1 April 1983).
The author develops a position-space renormalization-group transformation which can be employed to study general linear integral equations. In this Brief Report he employs his method to study one class of such equations pertinent to the equilibrium properties of fluids. The results of applying his method are in excellent agreement with known numerical calculations where they can be compared. He also obtains information about the singular behavior of this type of equation which could not be obtained numerically. (14 refs.)

59752 Phase transitions and the ordered state in models with a continuous set of energy minima in large- N limit. L.Golubovic (Lab. of Theoretical Phys., Inst. of Nuclear Sci., 'Boris Kidric', Vinca, Belgrade, Yugoslavia).
Phys. Rev. B (USA), vol.27, no.7, p.4488-90 (1 April 1983).
The author establishes a uniqueness theorem for equations governing large- N behavior of the N -component order parameter Landau-Ginzburg-Wilson (LGW) model with the general form of the quadratic term. The theorem is used to support some conclusions of a paper of Ling, Friman, and Grinstein (LFG) concerning the LGW model, the excitation spectrum of which has as an absolute minimum a ring $\{q\}$ imbedded in d -dimensional reciprocal space. For this model they prove the nonexistence of phase transitions when $d \leq 3$ and $N = \infty$, which strengthens the statement of LFG that there is no second-order transition in this case. When $d > 3$ and $N = \infty$ there is a second-order transition to a phase, being the superposition of spirals whose wave vectors lie on $\{q\}$, such that the length of the order parameter is spatially independent. They point out that the LGW model does not possess metastable states when $N = \infty$. (8 refs.)

06.20J Determination of fundamental constants

59755 Precision measurements and fundamental constants. F.M.Pipkin (Harvard Univ., Cambridge, MA, USA), R.C.Ritter.
Science (USA), vol.219, no.4587, p.913-21 (25 Feb. 1983).
Recent developments in the techniques for making precision measurements and their use in the determination of the fundamental constants are reviewed. Particularly noteworthy developments are clocks with high stability, the proposed redefinition of the metre in terms of the standard for time, and the increased precision with which electrical standards can be maintained. The relevance of precision measurements to tests of general relativity is briefly discussed. (51 refs.)

06.30 MEASUREMENT OF BASIC VARIABLES

06.30C Spatial variables measurement

(inc. measurement of all variables extending in space e.g. diameter, height, thickness, displacement, surface topography, particle size, area of disperse systems)

59756 A convenient Fizeau interferometer for thin film thickness measurement. J.J.Prabhakaran, G.Balasubramanian, R.P.Riesz (Post-Graduate Dept. of Phys., American Coll., Madurai, India). *CSIO Commun. (India)*, vol.9, no.1, p.40-3 (Jan.-March 1982). [received: March 1983]

A Fizeau interferometer set-up using Tolansky technique for thin film thickness measurement is presented. The interferometer fringes are seen through a microscope in the reflected configuration. The usual problem of aligning the fringes perpendicular to the travelling microscope bed is avoided by using a rotating micrometer eyepiece in the micropiece. The tedious problem of controlling the direction and spacing of the interference fringes is solved with the help of mechanical fingers. As an example, thickness of a thin film was measured using two different wavelength sources. (4 refs.)

59757 Topographic quantification of non-planar localized surfaces. K.Wright, B.Karlsson (Dept. of Engng. Metals, Chalmers Univ. of Technol., Goteborg, Sweden).

J. Microsc. (GB), vol.130, pt.1, p.37-51 (April 1983). The topography of non-planar localized surfaces can be quantified by roughness indices as well as by height and angular distributions of the surface elements. For the roughness indices general relationships between the profile and spatial quantities including overlapping have been established. Some measurement methods are briefly considered. The profile analysis has proved to be a reliable, easy and fast way to characterize the topography of surfaces. (15 refs.)

59758 Testing the accuracy of tensometry. I.Palfalvi. *Minozeg & Megbizhatóság (Hungary)*, vol.16, no.3, p.207-10 (1982). In Hungarian.

The resistance strain gauge is the generally used sensing element of an extensometer. The change of resistance and the elongation are related by the basic equation of tensometry. The author shows that this basic equation was derived on false assumptions and may lead to considerable errors. The theoretical study has been confirmed by industrial and laboratory experiments. (3 refs.)

59759 Non-optical surface topography by projected interference fringes. O.D.Souares (Centro de Física, Univ. do Porto, Porto, Portugal). *Port. Phys. (Portugal)*, vol.13, no.3-4, p.217-31 (1982).

Optical measurement techniques have always played an important role in precision metrology. Surface topography is a topic of great interest to science, technology and industry. Application of the technique of projected interference fringes in non-optical surface topography is described. Details and limitations of the technique are discussed. Prospects associated with the introduction of digital image processing are outlined. (14 refs.)

59760 Using an electron beam to study the surface microrelief of solids. B.N.Vasichev, G.L.Abramov.

Sov. J. Opt. Technol. (USA), vol.49, no.7, p.422-4 (July 1982). Translation of: *Opt.-Mekh. Prom-st. (USSR)*, vol.49, no.7, p.21-3 (July 1982). [received: April 1983]

Images of fractures, obtained by means of a scanning electron microscope are examined by the optical-structure computer analysis method. It is shown that a quantitative analysis of the microrelief of surfaces can be used to identify and evaluate the character of their damage resulting from fractures and mechanical working. (3 refs.)

59761 Error analysis of displacement measurement by correlation techniques. M.Ishibashi, T.Idogawa (Inst. of Appl. Phys., Univ. of Tsukuba, Ibaraki, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.1, p.100-1 (Jan. 1983). In Japanese.

Error analysis of displacement measurement by correlation techniques using an ITV camera is presented. Main sources of errors, exposure time of the camera and interpolation of discrete correlation functions with estimation-variance, are discussed. Application of the analysis to a typical example shows the existence of optimum sampling interval. (4 refs.)

06.30E Mass and density measurement

59762 The effective area of a pressure balance with a mixed principle of operation. R.Wisniewski, M.Urbanski, A.Golkowska (Inst. of Phys., Warsaw Tech. Univ., Warszawa, Poland).

High Temp.-High Pressures (GB), vol.14, no.3, p.311-14 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981).

Theory is presented for the variation with pressure of the effective area of a hybrid unit comprising a pressure balance with a simple piston-cylinder assembly combined with a reentrant cylinder. From the formula obtained,

numerical calculations for the pressure dependence of the effective area over the pressure range up to 1 GPa are given. (4 refs.)

06.30F Time and frequency measurement

59763 Frequency calibration using rubidium.

Qual. Today (GB), p.77 (Feb. 1983).

Describes the Argo Systems AS 210 calibration system developed for the United States Navy which is essentially a lightweight portable secondary standard. The heart of the system is a self-contained rubidium frequency standard (RFS) with 2 parts in 10^{-11} accuracy—one usually associated only with laboratory secondary standards. The practical value of the RFS is its employment on-site at the user's location. Downtime is greatly reduced and there is no need to move equipment away from the operation centres to a laboratory. The AS 210 is made up of a series of modular plug-ins in a water-resistant mainframe. (no refs.)

59764 Effect of vertical deflection nonlinearity on the accuracy of measurement of time parameters with an oscilloscope. V.I.Kimel'bat.

Meas. Tech. (USA), vol.25, no.7, p.614-17 (July 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.7, p.55-6 (July 1982). [received: Feb. 1983]

The accuracy of time interval measurements on CRTs is frequently significantly affected by the nonlinearity of the vertical deflection channel. The effect of the vertical nonlinearity on the accuracy of measurement of the duration of the pulse and its leading and trailing edges is analysed and formulas are derived which enable evaluation of the significance of the resulting measurement errors. Exp. Tech. (USA), vol.7, no.1, p.22-4 (Jan. 1983). PET microcomputers represent a low-cost computational and controlling facility which is being introduced in many laboratories in order to help engineers and scientists carry out their experiments efficiently. Four types of applications where the PET uses the IEEE bus are outlined. Two specific applications of the PET are described, one for measuring the RMS of a random signal, the other in a measurement system employing the Keithley Model 177 digital multimeter. (3 refs.)

59768 CAMAC controller for a conventional and pseudorandom time-of-flight system. A.M.Ducours, C.J.Yashinovitz (Bell Labs., Murray Hill, NJ, USA).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.444-53 (April 1983). Time-of-flight methods are valuable in measurements of the velocity distribution of low-energy atoms and molecules whose energies are difficult to measure directly. A system is described which uses pseudorandom beam chopping and a CAMAC compatible computer interface to provide energy resolution as good as conventional time-of-flight techniques, but with a duty factor of 50%. This system was designed for ice sputtering experiments. (18 refs.)

06.70 GENERAL INSTRUMENTATION

59769 Errors due to transverse sensitivity in strain gages. *Exp. Tech. (USA)*, vol.7, no.1, p.30-5 (Jan. 1983). Transverse sensitivity in a strain gage refers to the behavior of the gage in responding to strains which are perpendicular to the primary sensing axis of the gage. In plane wire strain gages, transmission of strain into the wire from a direction perpendicular to the wire axis is nearly negligible, but in foil strain gages the transverse sensitivity arises from much more complex phenomena, and it is affected by almost every aspect of grid design and gage construction. Errors due to transverse sensitivity are analysed and methods available for correcting the transverse sensitivity as well as the effects of shear strain are discussed. These include the rise of 'T'-rosette, three-gage rectangular rosette and delta rosette arrangements. (11 refs.)

59770 Flat panel display and projection display. K.Miyaji (Shibaura Inst. of Technol., Tokyo, Japan). *J. Acoust. Soc. Jpn. (Japan)*, vol.38, no.9, p.592-605 (Sept. 1982). In Japanese. Advancement in flat panel display and projection display technology is reviewed. Displays are divided into two categories: (1) active displays using emissive materials and (2) passive displays using nonemissive materials. A flat panel displays there are plasma displays, electroluminescent displays, liquid-crystal displays, electrochromic displays, magnetic particle displays, and cathode-ray tube displays; and projection displays, there are cathode-ray tubes and laser displays. These are briefly described. (30 refs.) *K.B.*

59771 Design and preparation of high-*Q* niobium reentrant cavities for physics measurements. W.C.Oelfke, W.O.Hamilton (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.410-14 (April 1983). Some techniques are given for the design, construction, and chemical surface treatment of niobium UHF reentrant cavities. These techniques ensure that when these cavities are operated at helium temperatures they will consistently display unloaded *Q* values above 10⁷. (16 refs.)

59773 Application of infra-red thermography to electrical engineering. Jin-Soo Song. *J. Korean Inst. Electr. Eng.*, vol.31, no.12, p.803-8 (Dec. 1982). In Korean. (6 refs.)

59774 Some special questions of infrared image forming. I.Benko, S.Konczol. *Meres & Autom. (Hungary)*, vol.31, no.2, p.42-6 (1983). In Hungarian. In thermotechnology infrared images are generally used to investigate the surface temperature distribution. However, image forming is influenced by other factors as well. The authors discuss the effect of the spectral sensitivity of image formers is influenced by other factors as well. The authors discuss the effect of the spectral sensitivity of image formers, the emission coefficient of the investigated surface, the direction of the observation and the shape of objects and the role of infrared reflection. Colour-photos show the appearance of the individual factors on the infrared pictures and this enables the suppression of disturbing circumstances in thermal tests. (5 refs.)

59775 Computerized evaluation of schlieren images [temperature field reconstruction]. L.I.Kiss. *Meres & Autom. (Hungary)*, vol.31, no.2, p.51-4 (1983). In Hungarian. Describes computerised methods for determining the temperature field from schlieren images. The methods reconstruct the temperature field using integration, and require algorithms to perform calculations that were previously carried out intuitively or graphically. (5 refs.)

59776 Measurement of the minimum resolvable temperature difference for thermal viewers. I.Kh.Vorakso, N.F.Soboleva. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.461-2 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.57-8 (July 1982). [received: April 1983] An energy parameter is discussed that makes it possible to characterize thermal viewers; this parameter is called the minimum resolvable temperature difference. The results of a measurement of this parameter for the 'Rubin' thermal viewer are presented. (1 ref.)

59777 Performance of a compact cooling unit utilizing air-water mist flow. T.Aihara (Inst. of High Speed Mech. Tohoku Univ., Sendai, Japan), R.Saga. *Trans. ASME. J. Heat Transfer (USA)*, vol.105, no.1, p.18-24 (Feb. 1983). Performance of a new compact cooling unit for semiconductors, being composed of an atomizer, a fan, and a heat-dissipating surface with no fin, has been measured over a wide range of the mass flow rate of spray water, *m*, and the wall heat flux. The heat transfer performance of the present compact, unit with *m*=0 to 1.05 g/s, attains 1.8 to 20 times that of the parallel-plate channel under the same thermal conditions. (24 refs.)

59778 Particulate fouling on the gas-side of finned tube heat exchangers. T.R.Bott, C.R.Bemrose (Dept. of Chem. Engng., Univ. of Birmingham, Birmingham, England). *Trans. ASME. J. Heat Transfer (USA)*, vol.105, no.1, p.178-83 (Feb. 1983). A 0.3-m (12-in.) square vertical wind tunnel has been built to provide air-flows in the range 2.4-5.8 m/s (490-1140 fpm) for fouling studies. Precipitated calcium carbonate dust can be fed into the airstream (which may be heated) prior to a heat exchanger model. The paper reports results on a four-row, four-pass spiral wound finned tube heat exchanger. Fouling tests have been carried out primarily near the extremes of surface heat flux available (1000 W/m² to -700 W/m²). The results have been analyzed by the general method of Kays and London to give an effective nondimensional airside heat transfer parameter (StPr^{1/3}) and a friction factor. Tests have covered the Reynolds number range from 1350 to 3800. Normalization of fouling data to fixed Reynolds numbers has given friction factor curves which increase to an asymptotic level between 1.4 and 2.5 times the initial value, whilst StPr^{2/3} values tend to fall by only 10-20 percent during the same time. (18 refs.)

59779 Evaluation of a method for heat transfer measurements and thermal visualization using a composite of a heater element and liquid crystals. S.A.Hippensteale, L.M.Russell, F.S.Stepka (NASA Lewis Res. Center, Cleveland, OH, USA). *Trans. ASME. J. Heat Transfer (USA)*, vol.105, no.1, p.184-9 (Feb. 1983). Commercially available elements of a composite consisting of a plastic sheet coated with liquid crystal, another sheet with a thin layer of a conducting material (gold or carbon), and copper bus bar strips were evaluated and found to provide a simple, convenient, accurate, and low-cost measuring device for use in heat transfer research. The particular features of the composite is its ability to obtain local heat transfer coefficients and isotherm patterns that provide visual evaluation of the thermal performances of turbine blade cooling configurations. Examples of the use of the composite are presented. (17 refs.)

07.20D Thermometry

59780 Vapour pressure thermometry in high magnetic fields using a Pirani gauge. M.Mori, S.Mase (Dept. of Phys., Kyushu Univ., Fukuoka, Japan). *Cryogenics (GB)*, vol.23, no.4, p.234-5 (April 1983). Vapour pressure thermometry has the advantage of not being affected by magnetic fields. Therefore, a study was carried out of thermometry below 1K using a Pirani pressure gauge in the vapour of He³. Its sensitivity and error in temperature measurements above 0.55K are dV/dT≥K⁻¹ and 0.4% respectively. Additionally, a semiconductor pressure sensor in the vapour of He⁴ was examined for the vapour pressure thermometry. (5 refs.)

59781 Take your IC's temperature. A.S.Joffe. *73 Amat. Radio's Tech. J. (USA)*, no.270, p.70-1 (March 1983). Describes the design of a solid-state centigrade thermometer. This uses a bridge arrangement and 200 μA meter. (no refs.)

59782 A sensitive ^{13}C MR shift thermometer using dysprosium ion in acetate buffer. P.J.Smolenaers, M.T.Kelso, J.K.Beattie (School of Chem., Univ. of Sydney, Sydney, NSW, Australia).

J. Magn. Resonance (USA), vol.52, no.1, p.118-19 (March 1983).
A D₂O solution of $\sim 0.04\text{ M}$ dysprosium nitrate in acetic acid-acetate buffer at pH 5.2 comprises a useful ^{13}C thermometer for aqueous solution spectrometry. The spectrum is simple; at 15 MHz only two resonances from the methyl and carbonyl carbons occur at either end of the normal ^{13}C spectral range. Hence the thermometric spectrum can be acquired simultaneously without complicating the sample spectrum. At 23 MHz the carbonyl resonance is broadened presumably through some exchange process. Addition of 4% V/V *p*-dioxane to the sample generates another peak $\sim 1500\text{ Hz}$ from the acetate methyl resonance. The temperature dependence of the peak separation is large— $\sim 4\text{ Hz deg}^{-1}$ at 23 MHz resulting in a sensitive temperature probe. A disadvantage of this thermometric solution is that each sample batch must be individually calibrated, since small differences in sample composition, especially in the lanthanide concentration, produce large changes in the observed shifts. Once calibrated, however, the solutions appear indefinitely stable in sealed tubes. (13 refs.)

59783 Taking the measure of temperature...

Lab. Equip. Dig. (GB), vol.21, no.3, p.91-7 (March 1983).

This equipment survey provides a brief insight into the wide range of instrumentation available for measuring temperatures from near absolute zero to 3000°C and focuses on hand-held digital versions. (no refs.)

59784 The possibilities of applying holographic interferometry in temperature measurement. R.Postasy.

Meres & Autom. (Hungary), vol.31, no.2, p.59-67 (1983). In Hungarian.

The different traditional optical methods, like the schlieren technology and the Mach-Zehnder interferometry have only a limited applicational possibility in the determination of the temperature distribution of flowing media. With the appearance of holographic interferometry a wider application of interferometry becomes possible. The author outlines the basic principles and advantages of the different holographic interferometric methods related to thermal measurements. As a practical example the studying of heat transfer around a heated cylinder is referred to. (5 refs.)

59785 Distant action thermometer with LED indication. K.Schlenzig.

Radio Fernsehen Elektron. (Germany), vol.32, no.1, p.25-6 (1983). In German.

The described equipment consists in principle of a remotely placed sensor (thermistor), a temperature-voltage converter amplifier (IC type A 277 D), driven by the converter bridge and provides 12 outputs for 12 LEDs type VQA 15. A more elaborate installation for temperature monitoring in an enclosed premise provides additional limit signalization by varying pitch sound signals. A full circuit diagram is reproduced and discussed in some detail. (1 ref.) A.L.

H.Kamioka (Dept. of Phys., Gifu Univ., Gifu, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.437-40 (March 1983).

A new ultrasonic cell for measurements of ultrasonic velocity and attenuation in a metal under both conditions of melting and solidifying processes has been designed. Ultrasonic pulse transmission method has been used in the present work. As an example, by using a new ultrasonic cell, sound velocity of Wood's alloy is measured at and around the melting temperature, and the results for the change of sound velocity in the vicinity of the melting point are reported and discussed.

07.20M Cryogenics

59787 Space adapted cryogenics. J.Lizon-Tati (Spacecraft Technol. Dept., ESA, ESTEC, Noordwijk, Netherlands).

Adv. Space Res. (GB), vol.2, no.4, p.85-95 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

The cooling requirements applicable to scientific and application payloads of space missions currently planned within the next decade are presented as well as the applicability of the various cryogenic techniques to these requirements. The severe constraints imposed by the spacecraft system, the launch vehicle and the space environment on the spaceborne cryogenic payload are commented on. Infrared astronomy is one of the most demanding candidates for space cryogenics and examples of relevant cooling systems currently under development or proposed for near future missions within ESA activities are described. (20 refs.)

59788 A temperature-variable sample rotating cryostat in high magnetic fields. K.Noto, Z.H.Lee, N.Toyota (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

Cryogenics (GB), vol.23, no.4, p.201-2 (April 1983).

A temperature-variable sample rotating cryostat has been developed in order to measure the angular and temperature dependence of the upper critical field in several single crystal Chevrel phase superconductors. In the cryostat, the temperature of the sample can be varied from 2 to 15 K within an accuracy of

$\pm 10\text{ mK}$. The sample can be rotated in an adiabatic vacuum can around a horizontal axis at the centre of superconducting magnets up to 16.5 T within an accuracy of $\pm 1^\circ$. (5 refs.)

59789 Effect of finite thermal conductivity of the separating wall on the performance of counterflow heat exchangers. K.Chowdhury, S.Saranghi (Advanced Inst. for Cryogenic Engng., Indian Inst. of Technol., Kharagpur, India).

Cryogenics (GB), vol.23, no.4, p.212-16 (April 1983).

Axial conduction is a major source of inefficiency in a compact counterflow heat exchanger. Any attempt to reduce axial conduction by using material of low thermal conductivity for the separating wall results in increased resistance to lateral heat flow, thereby reducing the overall thermal efficiency of the heat exchanger. The governing equations including axial conduction and lateral resistance due to the separating wall have been solved and an expression, for the overall efficiency of the heat exchanger has been derived in terms of relevant nondimensional parameters. Computed results have been presented which give the optimum thermal conductivity of the wall material. (6 refs.)

59790 A precision low temperature resistivity measuring cryostat. A.W.Sheikh (Indian Inst. of Technol., Bombay, India), J.Ray, R.S.Sannabhatti, G.Chandra.

Indian J. Cryog., vol.7, no.3, p.143-6 (1982).

A cryostat for electrical resistivity studies for the temperature range of 1.1 K – 300 K has been developed. Resistivity of metallic samples in the form of foils or wires can be measured. The temperature is controlled below 4.2 K within $\pm 5\text{ mK}$ by controlling helium vapour pressure and at higher temperatures within $\pm 30\text{ mK}$. The standard d.c. four-probe technique is used for measuring the sample resistivity ($1\text{ in } 10^6$). (1 ref.)

59791 On the cryostat for TSC measurements. A.Kenjo.

Technol. Rep. Kyushu Univ. (Japan), vol.55, no.4, p.337-41 (Aug. 1982). In Japanese. [received: Feb. 1983]

The usual cryostats for TSC (Thermally Stimulated Current) measurements are made of an evacuated sample cavity immersed in liquid nitrogen. The author constructed a new type of cryostat in which the inner cavity was cooled with liquid nitrogen. This cryostat enables the temperature to be raised at high heating rates as 1.2°C/s with low power and can save an amount of liquid nitrogen. TSC measurements on an Au-doped Si N^+P diode are performed to demonstrate how this crystal is effective in the experiment which requires high heating rates. (4 refs.)

59793 Construction and performance characteristics of an indigenous nude Bayard Alpert gauge. S.L.Verma, P.K.Naik (Tech. Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).

Vac News (India), vol.13, no.3, p.18-23 (Sept. 1982). [received: March 1983]

The nude Bayard Alpert gauge is a hot cathode ionization gauge for total measurement of pressures between 8×10^{-10} and 1×10^{-4} Torr approximately. In this gauge the envelope is removed and the gauge head is immersed in the vacuum chamber. The sensitivity of NBAG is determined in an ultrahigh vacuum (UHV) system by comparing it with a conventional Bayard Alpert gauge. (9 refs.)

07.35 HIGH PRESSURE PRODUCTION AND TECHNIQUES

(inc. pressures above 1 atmosphere)

59794 A system for determining fluid properties up to 136 MPa and 473 K . R.Simon, R.L.Schmidt (Chevron Oil Field Res. Co., La Habra, CA, USA).

Fluid Phase Equilibria (Netherlands), vol.10, no.2-3, p.233-48 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982).

The search for oil and gas has extended to deeper reservoirs, with higher pressures and temperatures. Recent discoveries have exceeded 6000 meters , 120 MPa , and 463 K . In order to obtain engineering data and do phase behaviour research at these conditions, Chevron has constructed a system that operates up to 136 MPa and 473 K . This system measures phase quantities, compositions, densities, viscosities, and interfacial tensions. The heart of the

system is a sapphire tube that allows visual observation of the fluids being studied. The paper describes the highlights of the system, includes data on sapphire strength, and presents information on viscosities and interfacial tensions measured by oscillating crystal and photon correlation spectroscopy techniques. (6 refs.)

59795 Generation of high pressure to 10 GPa by means of MASS OB-8 apparatus equipped with X-ray diffraction system. S.Yamamoto, H.Sawamoto, M.Kumazawa (Dept. of Earth Sci., Nagoya Univ., Nagoya, Japan), A.Hasegawa.

High Temp.-High Pressures (GB), vol.14, no.3, p.283-91 (1982). (10th Plan-see Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981). The multiple-anvil-sliding-system (MASS) OB-8 high-pressure apparatus equipped with an X-ray diffraction system is developed. The mechanism and the experimental techniques used for the generation of high pressures and temperatures with the apparatus are described in detail. This novel device enables the generation of pressures of ~10 GPa and temperatures of ~1000°C simultaneously in a volume of ~40 mm³, and the observation of the compressed sample in the pressure cell by means of X-ray diffraction. The in-situ measurement of pressure in the cell, based on the NaCl scale has revealed the detailed nature of the pressure-generating characteristics in this apparatus. One notable feature is the presence of a large hysteresis in the relation between the pressure generated and the external force applied. (13 refs.)

07.50 ELECTRICAL INSTRUMENTS AND TECHNIQUES

59796 Measurement of piezoelectric coefficients and permittivity with small specimens. A.W.Palmer, A.C.Lynch, A.T.Parish (Dept. of Electrical & Electronic Engng., City Univ., London, England). *IEE Proc. A (GB)*, vol.130, no.3, p.129-33 (May 1983).

Roughly cubical specimens of about 5 mm side can be used for obtaining results which are believed to be correct within 10%. For piezoelectric measurements, alternating mechanical pressure is used to produce a potential difference which is easily amplified and measured. A single specimen can be used for up to nine different measurements in compression and nine in shear; an alternative is the use of two specimens, tested only in compression. Permittivity along various axes can be measured with the same specimens. As an example, lithium niobate has been studied. (5 refs.)

59797 Thermally induced electric oscillations: a novel method of detection of piezoelectricity. A.Miniewicz, M.Samoc, J.Sworakowski, Z.Zboinski (Inst. of Organic & Phys. Chem., Tech. Univ. of Wroclaw, Wroclaw, Poland). *Mater. Sci. (Poland)*, vol.7, no.4, p.441-6 (1981). A new sensitive technique for studying elastic as well as piezoelectric properties of crystals is presented. The method, employing thermally induced electric oscillations (TIEO), has been tested with standard piezoelectrics: quartz and potassium dihydrophosphate. (12 refs.)

59798 Influence of inhomogeneous compensation on the capacitance measurements. A.A.Lebedev, N.A.Sobolev, B.M.Urunbaev (A.F. Ioffe Physico-techn. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1207-8 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1874-7 (Oct. 1982). [received: April 1983]

When the capacitance methods are used to determine the parameters of deep centers or to identify unknown impurities, it is usually assumed that the base of a diode is doped with deep-level impurities uniformly over its area. If a semiconductor is doped with an impurity that does not compensate a crystal, an inhomogeneous distribution of such an impurity does not affect significantly the results of the capacitance measurements because the time constants of the thermal and optical charging of levels are independent of the deep-level density. The authors show on the other hand, in the case of a compensating impurity its inhomogeneous distribution can result in some deviations from the usual relationships. (5 refs.)

59799 Standardization of the ohm by means of the Hall effect in silicon metal-oxide semiconductor structures at 0.4-0.7K. M.A.Vernikov, L.M.Pazinich, V.M.Pudalov, S.G.Semenchinskii (All-Union Sci.-Res. Inst. of Metrological Service, Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.355-6 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.820-3 (July 1982). [received: April 1983]

The quantum Hall effect in two-dimensional carrier inversion layers has recently attracted considerable research interest. The effect has made it possible to carry out several precise measurements of h/e^2 . Since the quantity h/e^2 has been measured independently of the Hall effect with an accuracy $\sim 10^{-7}$, the authors consider the inverse problem of creating an absolute standard for the ohm on the basis of h/e^2 . Previously measurements have been taken from Si MOS structures in magnetic fields up to 19 T. The authors consider taking measurements at lower temperatures and in weaker fields, ≤ 10 T. They find it realistic under the experimental conditions they describe to reproduce an absolute ohm within $\leq 10^{-7}$, i.e. within an uncertainty smaller by a factor ~ 30 than that for the standard presently in force. 07.55 MAGNETIC INSTRUMENTS AND TECHNIQUES

59800 Thin-film fourteen-hole DC SQUID gradiometer. W.Richter, K.Bluthner (Sektion Phys., Friedrich-Schiller Univ., Jena, Germany). *Exp. Tech. Phys. (Germany)*, vol.31, no.1, p.79-87 (1983). In German. A flat thin-film DC SQUID with fourteen holes and a superconducting input line was tested. The fourteen parallel holes with a relative area of 0.9 mm² lead to a SQUID inductance of 0.25 nH. The input line has an inductance of 22 nH and can be matched to a given signal source. The coupling factor between the input line and the SQUID is 0.5. The device is a gradiometer

with a small baseline and works without shielding in a laboratory environment. (15 refs.)

59801 Dynamics of DC-magnets and their application in the instrument manufacture. M.Konsulova. *Feingeraetetechnik (Germany)*, vol.32, no.2, p.64-5 (1983). In German. When a shading ring is laid around a part of the pole area of a DC-magnet the dynamics of the magnet are affected. Experimental and theoretical investigations for the determination of the magnetic fluxes are presented. (4 refs.)

59802 Measurement of Curie temperature and magnetization of ferromagnetic materials employing an RF oscillator. K.V.S.Rama Rao, V.Seshu Bai, C.Ramasastri (Dept. of Phys., Indian Inst. of Technol., Madras, India), N.Weiden, A.Weiss. *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.1-2, p.180-6 (1 April 1983).

Details of a method which employs an RF oscillator to determine the Curie temperature and magnetization of ferromagnetic materials have been described. The results obtained in some intermetallic compounds, namely CrFe, Mn₁₁Sb, Mn₁₂Sb, Mn₉₀Co₁₀Sb and Mn₉₀Fe₁₀Sb are presented. (14 refs.)

59803 Analogue resolver for fluxgate magnetometer signals. J.Baxendale. *New Electron. (GB)*, vol.16, no.6, p.25 (22 March 1983). Signals from the two orthogonal coils in a fluxgate magnetometer are conventionally processed by phase-sensitive detection circuits to give two analogue voltages. These are proportional to sine (X) and cosine (X) where X is the magnetometer bearing relative to magnetic North. Describes a method of resolving sin (X) and cos (X) to give bearing, X where an accuracy of $\pm 2^\circ$ is adequate. Four comparators are used to determine the appropriate bearing angle sector and to drive the analogue switches which select the appropriate function and offset. The analogue output is shown scaled from 0-1 V corresponding to a bearing of 45-405°. (no refs.)

59804 Measuring low coercive force using a vibrating sample magnetometer. J.A.Pesch (IBM System Products Div., Rochester, MN, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.480-1 (April 1983). The coercive force H_c of commercially pure iron and an 80% NiFe alloy were measured on toroid samples using a hysteresigraph and on nontoroid samples of the same materials using a vibrating sample magnetometer. Within experimental error, the results were equal for each case. Values of H_c appeared to be insensitive to specimen shape. It appears that the demagnetizing field, which for nontoroid specimens affects the gross shape of the hysteresis loop, can be ignored in the region of low-field measurements for these materials. (4 refs.)

59805 Production of strong magnetic fields by shock waves in a medium. S.D.Gilev, A.M.Trubachev (M.A. Lavrent'ev Inst. of Hydrodynamics, Acad. of Sci., Novosibirsk, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.396-7 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.914-17 (Aug. 1982). [received: April 1983]

The experiments showed that this dynamic method for producing the compression region can be used successfully to produce megagauss magnetic fields. The absence of a metal liner automatically solves the problem of creating the initial magnetic flux in the compression region, and the reduction of the number of ignition points makes it possible to substantially reduce the mass of the explosive charge. All these factors serve to simplify the design of the generator and to raise the possibility of using it in laboratory explosion chambers. (6 refs.)

07.58 MAGNETIC RESONANCE SPECTROMETERS, AUXILIARY INSTRUMENTS AND TECHNIQUES

(see also 61.16N EPR and NMR determinations)

59806 ORAND—a new NMR double resonance technique for obtaining symmetrically intensive multiplets by off-resonance experiments. H.-J.Osten, R.Radeglia (Akad. der Wissenschaften, Zentralinst. fuer Phys. Chem., Berlin, Germany), A.Illigmann.

Exp. Tech. Phys. (Germany), vol.31, no.1, p.75-8 (1983). In German. Under certain experimental conditions strong intensity asymmetries within the multiplets can appear in off-resonance decoupled PFT NMR spectra. A new measurement technique is presented which removes these asymmetries and simultaneously retains the strengthening of the signals by the nuclear Overhauser effect. (4 refs.)

59807 A programmable pulse generator [NMR radiospectrometer control]. V.P.Zelenin, S.B.Karpov, V.V.Yaroslaytseva (Perm Univ., Perm, USSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.4, pt.1, p.869-73 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.83-6 (July-Aug. 1982). [received: April 1983]

A simple pulse generator for an NMR radiospectrometer is described that is programmed from an Elektronika 60 microcomputer, which enables one to generate sequences of two, three, or more pulses, including ones with a repeating group of time intervals in order to control the transmitter, receiver, and suppressor in the spectrometer. The length of the time intervals can be varied from 0.5 μ sec to 100 sec. (3 refs.)

59808 Saturation transfer dispersion electron paramagnetic resonance using a balanced cavity: dynamical calibration and biological applications. P.A.Sehr (Inst. de Biologie Phys.-Chimique, Paris, France), C.Mailer, P.F.Devaux. *J. Magn. Resonance (USA)*, vol.52, no.1, p.23-34 (March 1983).

Saturation transfer dispersion electron paramagnetic resonance spectra of biological samples were recorded using a newly developed balanced cavity. With this configuration the U_1' spectrum (first harmonic dispersion 90° out of phase) has a signal-to-noise ratio comparable to that of the conventionally employed first harmonic-in-phase absorption signal (V_1). Spin-Labeled bovine serum albumin in glycerol/water mixtures was used to establish calibration curves of U_1' spectra. The sensitivity of U_1' to isotropic motions extends from 5.10^{-7} to 10^{-4} sec. The potential of U_1' combined with the balanced cavity scheme for the study of the dynamics of membrane bound proteins is also investigated. Cytochrome c oxidase and rhodopsin in disk membranes were used as model systems. The U_1' spectra of satisfactory signal-to-noise ratio can be obtained with one 8-minute scan and a spin concentration as small as 50 μ M in 10 μ l. The calibration curves obtained can be utilized as a first approximation for these anisotropic systems. (24 refs.)

59809 Proton chemical shifts in polycrystalline solids determined by off-resonance decoupling ¹³C CP-MAS NMR. A.Bax, T.A.Early, G.E.Maciel (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).

J. Magn. Resonance (USA), vol.52, no.1, p.35-41 (March 1983).

A ¹³C CP-MAS method is described which uses off-resonance decoupling in order to correlate directly bonded ¹³C-¹H pairs in the solid state. An analysis of the experimental results gives ¹H chemical shifts by inspection while at the same time separating various ¹H resonances via the paired ¹³C resonance. An example is shown using *p*-diethoxybenzene. (18 refs.)

59810 Practice of multidimensional stochastic NMR spectroscopy. The derivation of 1D, 2D, and 3D spectra. B.Blumich, D.Ziessow (Tech. Univ. Berlin, Berlin, Germany).

J. Magn. Resonance (USA), vol.52, no.1, p.42-56 (March 1983).

The hardware modifications necessary for the implementation of multidimensional stochastic magnetic resonance (MUDISM) on a conventional FT spectrometer are described and a practical way for the mass storage of the stochastic raw data is shown. Experimental spectra demonstrate different options in the data reduction. (15 refs.)

59811 A simple method for the calibration of the decoupler radiofrequency field strength. A.Bax (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).

J. Magn. Resonance (USA), vol.52, no.1, p.76-80 (March 1983).

A simple experiment is proposed which provides a convenient way to calibrate the decoupler radiofrequency field strength over a wide range of magnitudes and with high accuracy. The calibration can be performed on the sample to be investigated and an example is shown for sucrose. (16 refs.)

59812 Pulse sequences utilizing the correlated motion of coupled heteronuclei in the transverse plane of the doubly rotating frame. M.R.Bendall, D.T.Pegg, D.M.Doddrell (School of Sci., Griffith Univ., Nathan, Queensland, Australia).

J. Magn. Resonance (USA), vol.52, no.1, p.81-117 (March 1983).

In terms of the Heisenberg vector model, heteronuclei undergo a correlated motion via scalar coupling when both have their spins simultaneously in the transverse plane of the doubly rotating reference frame. Several pulse sequences are described in terms of ¹H/¹³C systems. A theoretical analysis of the correlated motions is given for methine (CH), methylene (CH₂), and methyl (CH₃) groups for the situation when the ¹H magnetization vectors are initially placed in the transverse plane of the doubly rotating frame and are allowed to precess freely for (2J)⁻¹ sec, where J is the single-bond ¹H-¹³C coupling constant, prior to the carbon polarization transfer vectors being placed in the transverse plane. The analysis is confirmed experimentally using two-dimensional NMR and the usefulness of the sequences for two-dimensional NMR is assessed. The family of sequences is completed with a theoretical study of sequences which employ polarization transfer in addition to the correlated motion. Experimental verification for the one-dimensional use of these sequences, the exclusive polarization transfer sequence (EPT), in editing ¹³C spectra is given. Reverse EPT, the inverse of EPT, is also described and is shown to be useful for editing ¹H spectra. While it is pointed out that the authors expect there to be a correspondence between correlated motion and Schroedinger picture multiple-quantum coherence, the details of this correspondence are not explored. (19 refs.)

59813 Elimination of solvent signals in carbon magnetic resonance spectroscopy. J.Bornais, S.Brownstein, S.Bywater (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Canada).

J. Magn. Resonance (USA), vol.52, no.1, p.120-22 (March 1983).

The problem of a strong or obscuring solvent signal in proton resonance spectroscopy was alleviated by the use of perdeuterated solvents. The practice of stabilizing the magnetic field-frequency ratio for the spectrometer via the deuterium resonance of the solvent followed from the almost routine use of deuterated solvents and was continued for carbon magnetic resonance. Perdeuterated solvents depleted in ¹³C were developed to remove interfering solvent signals in those cases where the reactivity of the reagents restricted the choice of solvent. However, these are expensive and only available for a few solvents. It has recently become possible to distinguish the number of hydrogen atoms directly bonded to a carbon atom by the modulation of the signal of that carbon atom in response solely to an appropriately gated proton decoupling sequence. For most organic molecules the cancellation of signals from secondary and quaternary carbons is not quite complete because of long-range carbon-hydrogen coupling and because of the range of values found for one-bond carbon-hydrogen coupling constants. Therefore very weak signals are often found for them. In perdeuterated molecules the cancellation of the carbon resonance signals should be complete since there is no carbon-hydrogen spin coupling. (8 refs.)

59814 Correlation of isotropic shifts and chemical shift anisotropies by two-dimensional Fourier-Transform magic-angle hopping NMR spectroscopy. A.Bax, M.Szeverenyi, G.E.Mszchiel (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).

J. Magn. Resonance (USA), vol.52, no.1, p.147-52 (March 1983).

A two-dimensional (2-D) Fourier transform (FT) technique which presents the isotropic average chemical shift, $\sigma_1 = (\sigma_{11} + \sigma_{22} + \sigma_{33})/3$, in one frequency dimension (F_1) and the static CSA powder pattern along the other frequency axis (F_2) is presented. The experiment is carried out using discrete 'hops' between evolution segments, rather than continuous sample spinning, and no spinning sidebands are produced. As the detection occurs on a static sample, the signal decays more rapidly than in a normal MAS experiment, and sensitivity suffers correspondingly. Preliminary results show the promise for obtaining powder patterns for individual peaks of complex molecules for which a straight forward nonspinning approach would yield only broad bands of inextricably overlapping powder patterns. This and related experiments are under extensive study. (11 refs.)

59815 Selective solvent suppression in ¹H FT NMR using a DANTE pulse: its application in normal and NOE measurements. C.A.G.Haasnoot (Biophys. Dept., Faculty of Sci., Nijmegen, Netherlands).

J. Magn. Resonance (USA), vol.52, no.1, p.153-8 (March 1983).

Strong peaks arising from solvents or impurities often present an arduous problem for NMR spectroscopists. Especially in ¹H FT NMR studies of biological molecules, when low concentrations of solute (e.g. ≤ 1 mM) are to be examined in D₂O solution, the detection of the weak signals of the solute in the presence of the large residual HDO peak poses a severe dynamic range problem. Apart from the resulting sensitivity reduction of signals arising from the solute, the solvent line may also obscure a portion of interest in the spectrum. Many techniques have been developed for eliminating or suppressing a solvent line from the spectrum, one of which is the WEFT (Water Eliminated Fourier Transform) method. Important to note, however, is the normal WEFT constraint that the longitudinal relaxation time T_1 of the solvent must be significantly longer (or shorter) than the relaxation time of the signals of interest. This requirement is not always fulfilled in the case of small molecules and for biological molecules under specific conditions. The self-complementary hexaribonucleotide (r-CGCGCG) may serve as an exam-

ple of the latter difficulty. In aqueous solution this molecule adopts a double helical structure at ambient temperature. The normal spectrum of a 1 mM sample of this compound in D₂O at 25°C is shown. The residual HDO peak is by far the most intense signal in the spectrum. When the sample is properly degassed, the longitudinal relaxation time of the signals of the hexaribonucleotide appears to be similar to that of the residual HDO resonance. This situation is remedied by modifying the method according to a suggestion of Morris and Freeman (1928): instead of a nonselective π pulse, a selective π pulse is applied to the residual HDO resonance. The selective excitation is created by a so called DANTE pulse sequence. For the rest the normal WEFT scheme is followed. (9 refs.)

59816 NMR broadband decoupling with low radiofrequency power. A.J.Shaka, T.Frenkiel, R.Freeman (Phys. Chem. Lab., Oxford Univ., Oxford, England).

J. Magn. Resonance (USA), vol.52, no.1, p.159-63 (March 1983).

For high resolution NMR spectroscopy of carbon-13, it is important to be able to achieve broadband proton decoupling with the minimum dissipation of radiofrequency power in the probe. Otherwise undesirable heating effects can occur, and the resulting convection may degrade resolving power and sensitivity. Radiofrequency power dissipation is proportional to $d(B_2)^2$ where B_2 is the radiofrequency intensity and d is the duty cycle of the irradiation. It is convenient to define a figure of merit Z for decoupling performance $Z = \Delta B_{\max}/(B_2 d^{1/2})$ where ΔB_{\max} defines the range of proton offsets for which the decoupled carbon-13 resonance is at least 80% of its maximum peak height (measured with coherent irradiation at resonance). The first evidence of imperfect decoupling is a small unresolved residual splitting of the carbon-13 resonance, made manifest by a reduction of peak height. The choice of carbon-13 line broadcasting function determines the sensitivity to small imperfections of the decoupling performance. A full width at half height of 2 Hz has been adopted as the practical standard, taken to be reasonably typical for routine carbon-13 spectroscopy. (14 refs.)

59817 EPT with two variable pulse angles, a universal polarization transfer sequence. M.R.Bendall, D.T.Pegg (School of Sci., Griffith Univ., Nathan, Queensland, Australia).

J. Magn. Resonance (USA), vol.52, no.1, p.164-8 (March 1983).

Recently the authors generalized the EPT sequence (Bendall et al. 1982, 1983) to the DEPT and inverse DEPT pulse sequences, which provide the same polarization transfer enhancements as INEPT and inverse INEPT but have advantages over the latter sequences which include less sensitivity to miset delay periods, thus providing more accurate editing of ¹³C and ¹H spectra; distortionless coupled spectra; and fewer pulses in the sequences. However, unlike INEPT, these sequences have so far been restricted to spin-half heteronuclei. They show that DEPT and inverse DEPT are just special cases of a more general pulse sequence, which is applicable to two scalar coupled spin systems, each containing an arbitrary number of nuclei of arbitrary spin, provided the coupling between the two systems can be characterized by a single constant. They call this the universal polarization transfer (UPT) sequence. (9 refs.)

59818 Efficient fast-recovery scheme for NMR pulse spectrometers. N.S.Sullivan, P.Deschamps, P.Neel, J.M.Vaissiere (CENS, Gif-sur-Yvette, France).

Rev. Phys. Appl. (France), vol.18, no.4, p.253-61 (April 1983).

Describes an active damping circuit, which uses a 90° phase-shift feedback loop to dampen the ringing of nuclear resonance probes just after the RF excitation. The damping does not operate during the reception of the nuclear signal and there is therefore no loss in efficiency or in sensitivity as would be the case for permanent damping. The use of a high voltage FET as a gated duplexer to isolate the RF transmitter after the pulse is also described. The circuit damper is especially useful at low frequencies and the authors have been able to reduce the recovery time of a series resonant circuit ($Q=50$) to less than 7 μ s at 3 MHz using this feedback scheme and the gated duplexer. (35 refs.)

59819 Inexpensive moderate speed input processor and buffer memory for NMR instrumentation. S.D.Kunz, A.G.Redfield (Phys. Dept., Brandeis Univ., Waltham, MA, USA).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.503-4 (April 1983).

An inexpensive, moderately fast input converter, adder, and buffer memory is described for use with an NMR instrument. Speed is a few microseconds per 12-bit data point and word length and size are essentially unlimited. (2 refs.)

59820 Automatic magnetic dichrometer for the $\lambda=10.6 \mu$ m range [for free carrier concentration determination]. G.N.Potikhonov, E.K.Galanov, V.G.Medvedev, O.R.Zudov (Vavilov State Optical Inst., Vavilov, USSR).

Ind. Lab. (USA), vol.48, no.6, p.591-4 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.55-7 (June 1982). [received: March 1983]

The authors describe a device developed to measure the magnetic circular dichroism in narrow-band semiconductors in the range 77 to 300K. Using this device the free carrier concentrations of these materials can be determined. (6 refs.)

59821 Measuring thin film parameters by inputting light through a prism. A.N.Ageev, E.N.Mokrushina, A.S.Trifonov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1255-6 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2044-6 (Oct. 1982). [received: April 1983]

To achieve maximum measurement accuracy it is necessary to increase the distance between the prism and the film every time a new mode with a higher mode number is investigated. However, this makes it much more difficult to record multimode film spectra. The difficulty can be circumvented by including prism effects on the mode structure in the calculations; the main difficulty here is to find the size of the gap. The authors show that the gap distance can be determined by comparing spectra for the TE- and TM-polarization modes recorded simultaneously. (8 refs.)

59822 Truncation error in colorimetric computations. W.Erb, M.Krystek (Phys. Tech. Bundesanstalt, Braunschweig, Germany).

Color Res. & Appl. (USA), vol.8, no.1, p.17-22 (Spring 1983). The wavelength interval 360-830 nm relevant in colorimetric computations is sometimes truncated by the instrument used to measure the spectral characteristics of a material, or the spectral power distribution of a source, or simply by choice. The (systematic) error resulting from this truncation has been derived. Tables are given for the calculation of the truncation error in each case. (4 refs.)

59823 Greyness of process colors. R.H.Gray (Photo Products Dept., E.I. du Pont de Nemours & Co. Inc., Parlin, NJ, USA).

Color Res. & Appl. (USA), vol.8, no.1, p.43-6 (Spring 1983). A method of measuring and comparing the greyness (unwanted spectral absorptions) of process colorants has been developed. The method uses the 1976 CIELAB color space and, in effect, makes a chromatic match of a trial colorant with a reference Cromalin color and then calculates greyness from the difference of their values of CIE 1976 lightness L. (11 refs.)

59824 Determination of optical constants by photometry. L.Ward (Dept. of Appl. Phys., Coventry Polytech., Coventry, England).

J. Phys. D (GB), vol.16, no.4, p.L71-3 (14 April 1983). A recent study of the accuracies of determining the optical constants of thin films, for film thicknesses up to 0.04 λ , has been extended to include film thicknesses up to 0.25 λ , and the results are reported. It is shown that the method may also be applied to bulk materials. (2 refs.)

59825 A converter of monochromatic radiation to electrical voltage. A.Skubis.

Pol. Tech. Rev. (Poland), no.5-6, p.5 (1982). The photocell converter is designed for measuring the power of monochromatic radiation. It is particularly suitable for measuring the power of He-Ne lasers and LED diodes. The converter consists of a measuring probe adapted for hooking up to any analogue or digital indicator, or to a recorder with input impedance greater than 10 k Ω /V and measuring range expressed in mV. Its operation consists in a conversion of the power of monochromatic radiation to an electric voltage by means of a silicon photocell whose resistance is selected in such a way that it is a function of wavelength and photocell efficiency. A patent application for the converter design has been filed at the Polish Patent Office. Its conversion accuracy is 1%, photo-sensitive element diameter 20 mm, wavelength range 0.4...1.1 μ m and radiation power measuring range 15 μ W...50 mW. (no refs.)

59826 Low-cost microprocessor-based photon correlator. N.S.Murthy, D.M.Choudhary (Instrumentation Programme, Reactor Res. Centre, Kalpakam, India).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.476-9 (April 1983). A simple cost-effective microprocessor-based correlator is described which can be used for Gaussian as well as nonGaussian light sources. Error calculations are presented to show that there is no significant improvement in accuracy by adopting 4-bit word length in preference to 3-bit word length. The instrument can also be used in Raman and Raleigh scattering experiments. A few experimental results are presented bringing out the importance of correlation averaging in S/N enhancement. Some autocorrelograms for fluctuations in the scattered light from polystyrene spheres suspended in water are also presented. The instrument can sample 1500 points and calculate 85 correlations in each scan. All the parameters such as number of samples, number of correlations, number of scans, and the sampling time are user programmable. (6 refs.)

59827 Analysis of operation of double-beam photometer for monitoring the thickness of thin films. R.Kh.Fazylyzanov.

Sov. J. Opt. Technol. (USA), vol.49, no.8, p.519-21 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.47-50 (Aug. 1982). [received: April 1983]

The operation of a double-beam photometer for monitoring the thickness of thin films through the use of a control sample, a portion of which was coated with a quarter-wave layer of material, is analyzed. Expressions are given for calculating the errors for monitoring in terms of transmission extreme and by means of the double-beam photometer. The accuracy of the described method for monitoring a one-layer coating is an order of magnitude greater than the accuracy of monitoring in terms of extrema. The photometry procedure for a seven-layer mirror coating is calculated on a mathematical model. (4 refs.)

59828 Circuit diagrams of exposure metering devices for professional film cameras. M.F.Zelener, V.S.Pantelev.

Tekhn. Kino & Telev. (USSR), no.3, p.15-19 (March 1983). In Russian. The basic parameters and circuit diagrams of exposure metering devices used in professional filming equipment are considered. (7 refs.)

59829 Absolute spectral reflectance of mirrors. F.Grumb, T.Wightman (Res. Labs., Eastman Kodak Co., Rochester, NY, USA).

Color Res. & Appl. (USA), vol.8, no.1, p.40-2 (Spring 1983). Describes the techniques for measuring specular (regular) reflectance of mirrors on an absolute basis. Two independent methods of measuring mirrors are described, and data are presented for the two methods of measurement in the range 400-1500 nm. (2 refs.)

59830 An exact technique for mixing of immersion fluids [refractive index matching for photoelastic applications]. S.Singh (G.B. Pant Univ. of Agriculture & Technol., Nainital, India).

Exp. Tech. (USA), vol.7, no.1, p.27-9 (Jan. 1983).

In three-dimensional photoelastic investigations a reliable stress pattern can be achieved by immersing the specimen in a liquid having substantially the same index of refraction as the model. This technique is based upon the effect of concentration of refractive index of solutions. Graphs from which the proportions of the three most commonly mixed immersion fluids can be readily determined to obtain a desired value of the refractive index of the mixture are provided. (10 refs.)

59831 Method of measuring the refractive indices of absorbing media. A.I.Pen'kovskii.

Sov. J. Opt. Technol. (USA), vol.49, no.8, p.510-13 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.38-41 (Aug. 1982). [received: April 1983]

A method is proposed for measuring the refractive indices of absorbing media by means of FTIR [frustrated total internal reflection] without calculating or measuring the absorption. The method is based on the mutual compensation of the effects of the change in the parameters of the light polarization states at the critical incidence angles. (14 refs.)

07.60L Interferometry

59832 Optically recording interferometer for velocity measurements with subnanosecond resolution. D.D.Bloomquist, S.A.Sheffield (Sandia Nat. Labs., Albuquerque, NM, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.1717-22 (April 1983).

An optically recording velocity interferometer system, called ORVIS, has been developed to measure particle velocity histories in shock wave experiments on condensed matter. The interferometer fringe motion is recorded with a high speed electronic streak camera, rather than with photomultiplier tubes and oscilloscopes as in previous interferometry systems. With this approach, the particle velocity of a witness foil in a detonation wave experiment was measured with 300-ps time resolution. The authors believe that 20-ps time resolution can be achieved with this technique which would represent an improvement of two orders of magnitude over previous measurement techniques. (10 refs.)

59833 Photon-noise limitations in wave-front-folding interferometry. K.Itoh, Y.Ohtsuka (Dept. of Engng. Sci., Faculty of Engng., Hokkaido Univ., Sapporo, Japan).

J. Opt. Soc. Am. (USA), vol.73, no.4, p.479-85 (April 1983).

Statistical errors in mutual intensity, measured by a photon-noise-limited, wave-front-folding interferometer, are studied from the viewpoint of high-resolution imaging through the turbulent atmosphere. The effects of quantum noise in light detection on the modulus and phase measurements are analyzed, and simplified statistical models of normal distributions are derived. The errors that are due to both the photon noise and atmospheric phase-front perturbations are clarified by using the simplified photon-noise models and the so-called log-normal model for the atmospheric perturbations. The conditions under which the conventional method for phase-unwrapping preprocessing can be applied to the interferometric data are studied to specify the limitations of wave-front-folding interferometry. The analysis suggests the possible application of such interferometry to a survey of simple objects, such as binary stars, or to a detailed investigation of solar-surface structures. (27 refs.)

59834 Moire projection and high temperature Moire grid. H.Kockelmann, W.Zugi.

Mater. Test. (Germany), vol.25, no.4, p.120 (April 1983). In German.

In the high temperature region the production of a temperature independent grid of adequate contrast and stretch is important and the avoiding of physical contact with the ancillary optics. Often small apertures and correspondingly long exposures times are necessary, so that vibration free mounting is required. Depending on the temperature of the test piece, different types of grids can be used, say, for temperatures up to 150°C, in the range from 150 to 460°C, and above 460°C, where for extremely large extensions, electrolytically etched grids are useful. (no refs.) R.S.

59835 A Fabry-Perot etalon with one phase-conjugate mirror. M.Nazarathy (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA).

Opt. Commun. (Netherlands), vol.45, no.2, p.117-21 (15 March 1983).

A resonating structure composed of a plane-stratified lossless medium and a phase-conjugate mirror with loss or gain is analyzed by means of a scattering matrix method as well as by tracking the multiple reflections to their steady state. The amount of misdirection in the presence of losses or gains in the PCM is explicitly evaluated. (7 refs.)

59836 Acoustic sensitivity of a fiber-optic interferometer. M.M.Butusov, N.V.Ermakova, N.L.Urvantseva.

Opt. & Spectrosc. (USA), vol.53, no.2, p.115-16 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.193-4 (Aug. 1982). [received: April 1983]

There is a growing interest in the use of fiber-optic sensors (FOS) for measuring constant and variable pressures (in FOPS), since such sensors possess a broad frequency range and are convenient from the viewpoint of system

interconnection. However, sensitivity of a FOPS depends substantially on its construction and the type of fibers used. The most popular FOPS is an analog of the Mach-Zehnder interferometer, which is made by using single-mode fibers. The sensitivity of a phase FOPS is determined by the degree of phase change Φ of the wave passing through the working fiber per unit length per unit change of pressure i.e. M . The specific value of M is determined with known mechanical and optoelastic constants of the fiber material and its coating and is based on the mechanical model of the behavior of a fiber in an elastic medium, the model selection substantially affecting the computed results. Two models, namely the hydrostatic compression model and the balance-loss model have been proposed and yield different expressions for M . The authors have set up an experiment with an aim to verifying one of the models. (10 refs.)

59837 Ring polarization interferometer. Measurement of the flow rates of transparent media. I.A.Rokos, L.A.Rokosova.

Opt. & Spectrosc. (USA), vol.53, no.2, p.186-90 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.320-7 (Aug. 1982). [received: April 1983]

A ring polarization interferometer with an external modulator is described in which a nonreciprocal element consisting of a combination of quartz plates is used. This enables the effect of distortions of the state of polarization of the beam at the mirrors to be eliminated and also enables the effect of instability of the operating point of the modulator on the accuracy of the measurements to be removed. A ring polarization interferometer can thus be constructed with a threshold sensitivity of 10^{-6} . A method of designing modulation polarization interferometers using the Poincaré sphere is proposed. As an example, a ring polarization interferometer is described for measuring flow rates using the zero-compensation method, the accuracy of which is independent of the density and velocity distribution functions over the flow cross section. (11 refs.)

59838 Use of large reflectors in long-range interference measuring devices. G.V.Merkishin.

Sov. J. Opt. Technol. (USA), vol.49, no.7, p.465-6 (July 1982). Translation of: *Opt.-Mekh. Prom-st. (USSR)*, vol.49, no.7, p.60-2 (July 1982). [received: April 1983]

The field intensity in the Fraunhofer zone is analyzed for the reflection of monochromatic radiation from large triangular-aperture reflectors. It is shown that increasing the dimensions of the reflectors does not lead to a displacement of the interference pattern minima in the central interference region; therefore it can be used to obtain information by means of conventional interference measuring instruments. Increasing the reflector size simplifies considerably the recording of the interference information. (4 refs.)

59839 A fiber-optic rotation transducer. A.B.Bukhman, E.M.Dianov, A.Ya.Karasik, V.A.Kozlov, A.M.Prokhorov.

Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.4, p.87-9 (April 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.4, p.56-9 (April 1982). [received: April 1983]

A balanced method of measuring rotation velocities in a fiber-optic ring interferometer is described which can be used to measure velocities of rotation as low as 0.3 deg/sec with a single-mode light guide approximately 275 meters long. (16 refs.)

59840 Laser scanning microscope with automatic focusing. W.Deint

(Tech. Forschung K1 2, Wiesbaden, Germany), M.Linke, R.Muller, I.Sander. *Microsc. Acta (Germany)*, vol.87, no.2, p.129-38 (March 1983). In German.

Describes the design and functioning of a novel type of laser scanning microscope which provides pictures in a range of up to 1 cm \times 3 cm with a local resolution of 1 μ m. During the scanning process the profile of the tests item is followed by the optical system, the focus is adjusted over the surface within the depth of focus range. By means of noncontact position measurement by the optical system, the profile of the test item can be recorded with an accuracy of approximately 1 μ m. (4 refs.)

07.62 DETECTION OF RADIATION (BOLOMETERS, PHOTOELECTRIC CELLS, I.R. AND SUBMILLIMETRE WAVES DETECTION)

59841 Photoconductive detectors for space IR astronomy. E.T.Young

(Steward Obs., Univ. of Arizona, Tucson, AZ, USA). *Adv. Space Res. (GB)*, vol.2, no.4, p.59-68 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

Space observations promise greatly improved sensitivity for infrared astronomical observations. The author gives a survey of current discrete infrared detector technology. Emphasis is on impurity-doped silicon and germanium photoconductors, as these devices are the most sensitive detectors available from the middle infrared out to beyond 120 Nm. Following a discussion of the physics of detector operation, a description of fabrication techniques is given. Pre-amplifier designs are briefly considered. Under the low backgrounds expected in cryogenic telescopes, photoconductors exhibit multiple time constants, and the ionizing radiation environment in space can give rise to significant variations in detector responsivity. Techniques for dealing with the two kinds of anomalous behavior found in space-borne applications are discussed. (38 refs.)

59842 Temperature compensation of pyroelectric radiation detectors. G.Hofmann, N.Neumann, T.Hellfeld (Sektion Elektronik-Technol. und Fein-gerätech. Dresden, Dresden, Germany).

Exp. Tech. Phys. (Germany), vol.31, no.1, p.97-9 (1983). In German.

For many cases the temperature stability of the responsivity of pyroelectric radiation detectors can be improved by a suitable choice of the ratio between elements capacity and input capacity of the preamplifier. Some achievements of detectors made of γ -irradiated TGS and γ -irradiated DTGS are presented. (8 refs.)

59843 Effect of electric fields on long-wavelength response of infra-red detectors. D.D.Coon, R.P.G.Karunasiri (Dept. of Phys., Univ. of Pittsburgh, Pittsburgh, PA, USA).

Electron. Lett. (GB), vol.19, no.8, p.284-7 (14 April 1983).

The effect of electric fields on extrinsic semiconductor infrared-detector response at low temperatures is examined quantitatively at wavelengths beyond the zero-field cutoff. General formulas are presented along with numerical results for Si:P and Si:In. These results illustrate the possibility of narrow-bandwidth detection and electronically modulated response. (12 refs.)

59844 The AGA thermovision 110 and its applicational possibilities. D.Benko.

Meres & Autom. (Hungary), vol.31, no.2, p.71-6 (1983). In Hungarian.

From the infrared imaging devices known and used in Hungary, the device AGA 110 is the easiest to carry and handle. It can be used under severe observation circumstances. The sensitivity of the device can be changed to give grey tone image. On the basis of the technical properties it meets very well the requirements of error detection in operation. The author reports about the experiences obtained during the observation of thermic phenomena and the checking of heat losses. (2 refs.)

59845 Thermal imaging system with a two-phase ternary mixture of liquids. J.C.Loulergue, Y.Levy, C.Imbert (IOTA Univ. Paris-Sud, Orsay, France).

Opt. Commun. (Netherlands), vol.45, no.3, p.149-54 (1 April 1983).

A new infrared camera operating between 8 and 12 μ m is described. The thermo-optical properties of two superposed fluid layers are used. It is shown that the modulation of the fluid-fluid interface, due to the infrared image, of a two-phase ternary mixture can be made much larger than with a two-phase binary one. Making this modulation visible, is the principle of a sensitive IR-visible image converter. (17 refs.)

59846 Reconstruction of field statistics from the photocount statistics of an inertial detector. A.S.Arutyunov.

Opt. & Spectrosc. (USA), vol.53, no.2, p.179-81 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.307-12 (Aug. 1982). [received: April 1983]

An estimate of the relative effect of dead time on photocount statistics is made within the framework of the phenomenological theory of photoelectric recording. The author considers the possibility of a two-stage determination of the statistical characteristics of radiation when using photocounters that are known to be inertial, for which the effect of dead time is important. It is shown that the statistical information obtained by inertial detectors is in principle incomplete. A basis is given for three methods of establishing the photocount statistics of a noninertial detector from the experimental statistics of a real detector. (8 refs.)

59847 Fast pulsed-irradiation detectors using slow photoresistors and photodiodes. V.M.Mkhitaryan, Kh.V.Partamyan (Phys. Res. Inst., Acad. of Sci., Ashtarak, Armenian SSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1169-70 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1900-2 (Sept. 1982). [received: April 1983]

It is shown that slow photoresistors and photodiodes can be used as fast pulsed-radiation detectors with time resolutions down to 10^{-10} s, which enables one to overcome the lack of fast detectors for infrared radiation. (3 refs.)

07.65 OPTICAL SPECTROSCOPY AND SPECTROMETERS

(inc. photoacoustic spectroscopy)

59848 A microcomputer based system for stopped-flow kinetics. R.D.Jee

(School of Pharmacy, Univ. of London, London, England).

Lab. Microcomput. (GB), vol.1, no.3, p.5-10 (Autumn 1982).

Discusses apparatus in which data from a stopped-flow chemical kinetics experiment is stored on an oscilloscope and analysed. An interface for transferring data from a Gould Advance OS400 digital storage oscilloscope to a PET microcomputer is described. An Applied Photophysics model 1704

stopped-flow spectrophotometer was used for the kinetic measurements. (2 refs.)

59849 On the interaction operator in the optical spectroscopies. Duckhwan Lee, A.C.Albrecht (Dept. of Chem., Cornell Univ., Ithaca, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3382-92 (15 March 1983). The appropriate form for the interaction operator used to formulate electric-dipole spectroscopies of any order is discussed within the gauge-invariant formulation previously developed by K-H. Yang [Ann. Phys. (NY) 101, 62 (1976)]. Both 'active' (absorptive and emissive) and 'passive' (coherent wave-mixing) spectroscopies are examined. Though formally it is the 'position' operator which is the correct one when describing radiation-matter interaction in terms of the 'dark' eigenstates of material, it is found that under certain limiting constraints the 'momentum' operator leads to equivalent results. The demonstration proceeds without recourse to the commutation relation normally used to relate the position and momentum expressions for the spectroscopic parameters, and it applies to both active and passive spectroscopies at any order. However, for any of the multiply resonant (active or passive) spectroscopies, or for detailed line shape considerations in the active spectroscopies, damping effects must be introduced through the density matrix formalism. It appears that as long as damping is important, there are no circumstances under which the momentum operator expressions can match the correct, gauge invariant, position operator expressions for coupling the dark eigenstates. Finally, if the Hamiltonian defining the dark eigenstates is an approximate one, containing a nonlocal potential (such as a Hartree-Fock Hamiltonian), the momentum form of the interaction operator must be modified to include additional (well-defined) terms before the equivalency with the position operator is established. (34 refs.)

59850 Electric-field-induced differential rotational Raman scattering. A.D.Buckingham, R.A.Shatwell (Univ. Chem. Lab., Univ. of Cambridge, Cambridge, England). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3393-7 (15 March 1983). An electrostatic field induces a linear change in the intensity of light scattered by a gas in a circularly polarized incident radiation. Differential scattering intensities for *O*, *P*, *Q*, *R*, *S* lines are evaluated for a linear dipolar molecule. The weak *R*(0) line shows a strong differential scattering. In the classical limit, differential scattering comes from molecules initially in the nonrotating *J*=0 state. (13 refs.)

59851 Surface Raman ellipsometry. G.L.Eesley (Dept. of Phys., General Motors Res. Labs., Warren, MI, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.30, p.41 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Summary form only given, as follows. A method for achieving the ultrahigh sensitivity required for surface Raman spectroscopy is described. Polarization selective heterodyne detection permits shot-noise limited submonolayer detection with classically noisy picosecond laser sources. Preliminary experimental results show that the polarization selectivity can be used to reduce the overwhelming thermally induced changes in metal surface reflectivity. (no refs.)

59852 Determination of offset between a fixed wavelength laser and an absorption line using frequency modulation spectroscopy. P.Pokrowsky, E.A.Whittaker, G.C.Bjorklund (IBM Res. Lab., San Jose, CA, USA). *Opt. Commun. (Netherlands)*, vol.45, no.3, p.196-200 (1 April 1983). Frequency modulation spectroscopy is used as a new method to determine the detuning or optical frequency offset between a fixed laser line and the center of an adjacent absorption line. Because the offset is measured directly using high precision RF techniques, the accuracy is limited only by the laser linewidth. The method was demonstrated using (a) a dye laser set at a fixed frequency and an etalon resonance and (b) an infrared He-Ne laser and a methane absorption line. (12 refs.)

59853 Fast-scanning Fourier spectrometer online with a computer complex. V.V.Arkipov, V.N.Bodunova, B.V.Vylegzhanin. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.436-7 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.33-4 (July 1982). [received: April 1983] Reports on a fast-scanning Fourier spectrometer, designed to record interferograms and calculate spectra by means of a computer complex (M6000 and M4030 computers) connected to it remotely. The block diagram of the instrument is given and the features of its operating principle are described. The results of a measurement of several spectra along with a demonstration of the metrological capabilities are presented. The latter include an improved signal/noise ratio in the spectrum by a summing of the interferograms and a programmed generation of relative spectra with a single-beam measurement method. (3 refs.)

59854 Matrix isolation spectroscopy. A method for investigation of chemisorption on model systems of metal catalysts. (Construction, building and testing of an apparatus for producing matrix isolated metal atom clusters). M.Seidel, M.Grosch (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1065-72 (1982). In German. The authors describe, in addition to considerations of construction, the build-up and testing of equipment for producing matrix isolated metal atoms, metal atom clusters and their reaction products. A minimal temperature 10-15K was obtained on the sample holder. As a result one can use argon as matrix gas. The consumption of cooling liquid permits after cooling the sample holder and matrix preparation, a time of measurement of 4 hours. The electronic spectra of Ni atoms in an Ar, Kr Xe matrix showed a very good coincidence with literature results. (15 refs.)

59855 A tunable, single frequency UV source for high resolution spectroscopy in the 293-330 nm range. W.A.Majewski (Fysisch Lab., Katholieke Univ., Nijmegen, Nijmegen, Netherlands). *Opt. Commun. (Netherlands)*, vol.45, no.3, p.201-6 (1 April 1983). An easily tunable, single frequency source of UV radiation is described. The method is based on an intracavity second harmonic generation (SHG) using an angle tuned KIO₃ crystal in a ring dye laser. The 293-330 nm tuning range with maximum obtainable power of 15 mW and spectral linewidth between 180 and 500 kHz has been obtained for one crystal cut. The method described is simpler, more versatile and covers at least a three times broader spectral range than systems using temperature tuned crystals. Several applications to high resolution molecular spectroscopy are discussed. (22 refs.)

59856 Multispectral radiometer to measure crop canopy characteristics. E.J.Brach, P.Poirier (Engng. & Statistical Res. Inst., Agriculture Canada, Ottawa, Ontario, Canada), R.L.Desjardins, D.Lord. *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.493-500 (April 1983). A spectroradiometer has been designed for the study of crop reflectance characteristics in the spectral range of 400-1000 nm. Since the instrument records the ratio of incoming to reflected radiation the values obtained are independent of variations in solar elevation, and azimuth angle and atmospheric conditions. A filter wheel with four interchangeable interference filters is used for wavelength selection. The spectroradiometer traverses above a crop canopy on a movable track. This makes it possible to compare measurements from various locations several times in an hour, and to study more than one canopy a day. This instrument provides agronomists with data to estimate crop canopy characteristics such as leaf area index (LAI) rapidly and nondestructively. It also measures the variability of canopy reflectance introduced by temporal and spatial factors. (22 refs.)

59857 Possibilities of increasing the resolution of diffraction spectrographs. V.S.Plotnikov, D.A.Zhuravlev. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.401-2 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.1-3 (July 1982). [received: April 1983]

The possibilities of increasing the resolution of spectrographs by using modern echelle-type diffraction gratings are examined. The advisability of using gratings having blaze angles of 70-80° for obtaining high resolution and reducing instrument size is shown. An experimental model of a spectrograph having an actual resolution of 340000-950000 in the UV spectral region, whose construction is based on that of the commercial DFS-8 spectrograph, has been developed and tested. (5 refs.)

59858 Spectroscopic and dynamic studies in the extreme ultraviolet: recent progress and future possibilities. E.E.Marinero (Dept. of Chem., Stanford Univ., Stanford, CA, USA). Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.TuCl/1-3 Absorption of VUV and XUV radiation leads not only to highly excited electronic states of a molecular system but also to phenomena such as photofragmentation and photoionization. Progress in this field is reviewed with particular emphasis to the possibilities opened by the advent of XUV and VUV coherent sources. (no refs.)

07.65G IR spectroscopy and spectrometers

59859 Fourier transform infrared reflection-absorption spectroscopy of surface species. W.G.Golden, D.D.Saperstein (IBM Instruments Inc., San Jose, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.43-50 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). The authors have been able to demonstrate progress in Fourier Transform Infrared Reflection-Absorption Spectroscopy (FT-IRRAS) by incorporating a switching circuit into the data acquisition electronics of an air-equilibrated IBM IR/98 FTIR Spectrometer such that it is possible to obtain simultaneously both reference and polarization modulated spectrum. These spectra ratio to produce good discrimination against gas-phase species. The operating principles of this approach and sample FT-IRRAS spectra of monolayer assemblies of cadmium arachidate adsorbed on silver are discussed. (23 refs.)

59860 Electroreflectance vibrational spectroscopy: a new surface analysis technique using diode lasers. D.K.Lambert (Dept. of Phys., General Motors Res. Labs., Warren, MI, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.59-64 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

A new infrared technique to measure the vibrational spectra of adsorbed molecules is introduced. An infrared active mode of an oriented molecule has a first order Stark effect. Therefore, infrared absorption by oriented adsorbed molecules is modulated by an alternating electric field. The spectra is obtained by measuring this using a diode laser. The advantages and limitations of Electroreflectance Vibrational Spectroscopy (EVS) are discussed. The Stark tuning rate and consequent signal amplitude are calculated for a number of diatomic molecules. Measurements of diode laser intensity noise are used to estimate the signal to noise ratio for comparison with other techniques. (19 refs.)

59861 Intracavity dye-laser photothermal deflection spectroscopy. K.V.Reddy (McDonnell Douglas Res. Labs., McDonnell Douglas Corp., St. Louis, MO, USA).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.422-4 (April 1983). An intracavity, CW, dye-laser photothermal deflection (PTD) technique has been developed for gas-phase vibrational overtone spectroscopy. This new technique has a similar S/N ratio and significantly lower window noise than the intracavity photoacoustic technique under identical conditions. (5 refs.)

59862 Measurement of weak laser light absorption in materials transparent to infrared radiation. N.A.Kirichenko, B.S.Luk'yanchuk, A.N.Sapetskii, E.V.Siskayan (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1305-6 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2121-2 (Oct. 1982). [received: April 1983]

It has recently become necessary to fabricate materials with low absorptivity to IR laser radiation. This problem also requires that improvements be made in the methods used to measure small absorption coefficients of materials in

the IR spectrum. A highly sensitive technique (the dynamic method) has been suggested based on an unusual combination of calorimetric and interferometric techniques. The absorption coefficient κ is determined by measuring the period t_0 of the first oscillation caused by interference in the transmission of a plane-parallel plate during thermo-optical expansion. The authors find a correction to the equation for absorption which allows for thermal power losses (to first order) and demonstrate that the corrected equation is much more accurate (the error is roughly halved in typical experiments). (2 refs.)

59863 Intracavity laser spectrometer with a dispersive resonator using F_2^- color centers in an LiF crystal. Yu.L.Gusev, S.I.Marennikov, V.I.Serdnyukov, L.N.Sinita (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1370-1 (Oct. 1982). Translation of: *Kvantovaya Elektron. (Moskva USSR)*, vol.9, no.10, p.2105-6 (Oct. 1982). [received: April 1983]

An intracavity spectrometer utilizing F_2^- color centers and operating in the range 1.108-1.169 μ was developed. The spectrometer sensitivity was $\sim 10^{-8}$ cm $^{-1}$ and the spectral resolution was < 0.08 cm $^{-1}$. It was used to record the absorption spectrum of atmospheric air. All the recorded lines were due to water vapor. Transparency microwindows were found in the absorption spectrum of the atmosphere at wavelengths 1.108-1.169 μ . (5 refs.)

07.68 PHOTOGRAPHY, PHOTOGRAPHIC INSTRUMENTS AND TECHNIQUES

(for light sensitive materials see also 42.70)

59864 Electronic still-picture camera using magnetic bubble memory. K.Ohnishi, K.Murakami, K.Wakui (NHK Tech. Res. Labs., Tokyo, Japan). *ABU Tech. Rev. (Japan)*, no.85, p.31-6 (March 1983).

Outlines the experimental equipment for an electronic still-picture camera developed by NHK. The equipment used a frame transfer CCD as an image pickup device and a magnetic bubble as a recording device for digital recording. A means of electronically controlling the time of integration, which corresponds to the time of exposure in film cameras, and camera characteristics and variations of picture quality during the time of integration are described. (6 refs.)

59865 3M Colour Reversal 640T—a review. G.Ashton. *Br. J. Photogr. (GB)*, vol.130, no.12, p.318-20 (25 March 1983). 3M Colour Reversal 640T film is primarily intended for exposure by tungsten illumination of a colour temperature of 3200K and is said by the manufacturer to be ideal for exposures at low light levels in a wide variety of situations. The author assesses the film characteristics, the characteristic curves, colour balance and colour response and the sharpness and graininess. In testing Colour Reversal 640T film the comparison material chosen was the nearest competitor for speed and tungsten balance, Kodak Ektachrome 160 (Tungsten). (no refs.)

59866 Photometric errors induced by edge effects on hypersensitized Kodak spectroscopic plates, Type 103a-O. M.Bitrán (Dept. of Astron., Univ. of Florida, Gainesville, FL, USA). *AAS Photo-Bull. (USA)*, no.31, p.6-8 (1982).

A program of regular photographic photometry of quasi-stellar objects has been carried on at the Rosemary Hill Observatory since 1968 (Pollock et al., 1979; Pica et al., 1980). The 4X5-inch plates are exposed at the f/4 Newtonian focus of the 76-cm reflector. Nearly all of the regular monitoring is done with Kodak 103a-O plates that are hypersensitized by nitrogen baking followed by soaking in pure hydrogen, after the procedure described by Scott and Smith (1976). On the very earliest plates, ca. 1968, a single 2-inch field was recorded at the geometrical centre of the 4X5-inch plate. Very early on, however, a so-called '2-banger' cassette was designed by H.W. Schrader. Finally, however, the increasing number of exposures that were being made, as well as the sharply rising plate costs led Schrader to design the '4-banger' cassette. Some concern has existed because of the proximity of the fields in the new design to the edges of the plate. Sufficient statistics have accumulated to warrant a search for possible deleterious effects on the photometry. (5 refs.)

59867 Reciprocity failure of hypersensitized and unhyposensitized Kodak Technical Pan Film 2415. A.G.Smith (Dept. of Astron., Univ. of Florida, Gainesville, FL, USA).

AAS Photo-Bull. (USA), no.31, p.9-12 (1982). The sensitivities of hypersensitized and unhyposensitized samples of Kodak Technical Pan Film 2415 have been measured for exposures ranging from 3 sec to 2 hr in duration. Unhyposensitized 2415 film suffers severe low-intensity reciprocity failure over the entire range of exposures. Hydrogenated film, on the other hand, displays little reciprocity failure over the entire 2400:1 range of exposure times. A consequence of this is that the 'gain' from hypersensitization is a marked function of the exposure for which it is measured, varying from less than 3 for 10-sec exposures to 20 for exposures of 2 hr. (5 refs.)

59868 Electronic photo-flash with photoelectric release. G.Skribanowitz. *Radio Fernsehen Elektron. (Germany)*, vol.32, no.1, p.56-78 (1983). In German.

A high-performance flash is described, employing 5XVQA 15 LEDs as wide-angle photo-elements to operate an 80 WS flash tube (XB 81-00). Circuit diagrams of the mains-operated flash unit (ferrite ignition transformer data are included), of the control unit with thyristor switch, and of the built-in LED test circuit are reproduced and discussed. (7 refs.) A.L.

59869 Automatic camera lens focusing systems. R.B.Mitkin, V.A.Karpushin. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.453-8 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.50-5 (July 1982). [received: April 1983]

Various automatic camera lens focusing systems are examined. The specifications of automatic-focusing camera models are given. The principal directions for future development of such systems are indicated. (57 refs.)

59870 Spectroscopy and integral image quality. B.K.Rozhkov. *Sov. J. Opt. Technol. (USA)*, vol.49, no.8, p.521-31 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.50-9 (Aug. 1982). [received: April 1983]

The basic properties of the three-dimensional integral image and the characteristics of the lens-array photographic systems producing these images are examined. Literature data are analyzed. (79 refs.)

59871 A video tape editing system. A.I.Potashnikov, V.A.Studenikin. *Tekh. Kino & Telev. (USSR)*, no.3, p.6-11 (March 1983). In Russian. Considers some problems of using electronic video tape editing in feature film production. An editor developed by NIKFI and intended for filming on loca-

tions is described. The operation procedures and basic technical parameters of the system are given. (6 refs.)

59872 The Mars-2000M and Mars-3000M lighting devices. A.M.Kuritsyn, N.T.Semenikhin.

Tekh. Kino & Telev. (USSR), no.3, p.19-20 (March 1983). In Russian. The Mars-2000M and Mars-3000M lighting devices for filming are described as well as their light and operating characteristics. (2 refs.)

59873 The effect of modulation characteristics on the output of dye silver optical sound tracks in film prints. T.N.Noskova.

Tekh. Kino & Telev. (USSR), no.3, p.21-3 (March 1983). In Russian. An average output spread due to changes in modulation characteristics of film-print dye silver soundtracks was determined experimentally. The relative effect of changes in densitometric parameters of light and dark sound track areas was evaluated when vacuum stibium-caesium photomultipliers or silicon photodiodes are used in motion picture networks. (4 refs.)

59874 Deep UV lithography by using excimer lasers. (Photo-etching characteristics and development of uniform intensity irradiation system). Y.Kawamura, Y.Itagaki, K.Toyoda, S.Namba (Inst. of Phys. & Chem. Res., Wako-shi, Saitama, Japan).

Typical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.WA4/1-3. The photo-etching characteristics of photoresists for excimer lasers were investigated and compared with those of UV lamps. Uniform intensity irradiation system for micro-electronics processing is demonstrated. (8 refs.)

07.75 MASS SPECTROMETERS AND MASS SPECTROMETRY TECHNIQUES

(for mass spectroscopic chemical analysis, see 82.80)

59875 Calibration system for satellite and rocket-borne ion mass spectrometers in the energy range from 5 eV/charge to 100 keV/charge. A.G.Ghielmetti, H.Balsiger, R.Banninger, P.Eberhardt, J.Geiss, D.T.Young (Phys. Inst., Univ. of Bern, Bern, Switzerland).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.425-36 (April 1983). A new system has been developed for calibration of space plasma analyzers, in particular ion mass spectrometers. The system provides a large-area (~ 250 cm 2), highly parallel ($\pm 0.5^\circ$), and spatially uniform ($\pm 5\%$) beam of ions over the energy per charge range from 5 eV/charge to 100 keV/charge. Other special features include variable energy spread from $\Delta E \sim 1$ eV/charge to ~ 3 keV/charge and multiple charge state ions such as He^{2+} or Xe^{2+} . Among several key ion optical elements are a high-efficiency electron bombardment ion source capable of delivering $\sim 10^{-8}$ A, a 90° crossed electric and magnetic field mass spectrometer designed to produce either a mixed or a mass-selected beam, and a unique beam expansion system which produces the uniform large-area beam. The system also includes automatic beam monitoring and control via a feedback loop, as well as provisions for semiautomatic control of angle and energy analysis. Use of the calibration system during its development phases has made possible the rapid calibration of five complex satellite ion mass spectrometers already flown. Data from one of these calibrations are discussed. (26 refs.)

59876 Criterion for optimizing ion sources produced by electron impact ionization. L.N.Gall' (Inst. of Analytical Instrumentation, Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1280-3 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2086-92 (Oct. 1982). [received: April 1983]

A simple algorithm is given for calculating a figure of merit I_{max} which is used to analyze and optimize ion sources with bulk ionization. The parameter I_{max} is derived using phase space and beam transport techniques and can be used to treat the initial ion distributions in the ionization region, the focusing properties of the ion-optical system in the ion source, and the beam transport conditions in the mass analyzer. The algorithm is used to calculate the parameters of ion source of the Nir type. (5 refs.)

07.77 PARTICLE BEAM PRODUCTION AND HANDLING; TARGETS

(see also 29.25 in elementary-particle and nuclear physics, 41.80 Particle beams and particle optics)

59877 Beam-plasma type metal ion source. J.Ishikawa, T.Takagi (Dept. of Electronics, Kyoto Univ., Kyoto, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.534-40 (March 1983). A metal ion source, whose operation is based on a beam-plasma type ion source, has been developed. Heating of a plasma production chamber (1160°C) and generation of axial magnetic field (0.029 T) were both achieved by DC current flow through a solenoid filament. A continuous ion current of 2-3 mA (Ag, Al, Sb, Mn, Pb) was extracted from a single aperture at a low extraction voltage of 5.2 kV; this was due to a high density plasma production by means of beam-plasma discharge and an ion extraction with ion

space-charge compensation by beam electrons and high energy plasma electrons. For the case of silver ion beam, a silver ion with a purity of 99.5% was extracted without a mass analyzer. Normalized emittance and normalized brightness were 1.9×10^{-8} m.rad and 1.1×10^{11} A.rad $^{-2}$ m $^{-2}$, respectively.

59878 Nonlinear multichannel pulse-sharpening line containing ferrite rings with nonrectangular hysteresis loop. V.A.Shvets (Joint Inst. for Nuclear Res., Dubna, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.908-12 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.116-19 (July-Aug. 1982). [received: April 1983]

The design is discussed and test results reported for a low-impedance nonlinear multichannel pulse-sharpening line using ferrite rings with a nonrectangular hysteresis loop. Minimal rise times of 0.5 nsec for stationary shock waves are shown to be attainable by combining nonlinear pulse-sharpening channels in parallel inside an external coaxial conductor. The dependence of the rise and delay times of the shock wave front as a function of the current amplitude, length of the pulse-sharpening line, demagnetizing current, etc., are given for the bundle of pulse-sharpening lines tested. The assembly (containing 6000 ferrite rings) is designed as a module in the system controlling the high-current electron beam. (9 refs.)

59879 An intense electron beam source. J.Yeheskel, D.Gazit, R.Avida, M.Friedman (Nuclear Res. Center-Negev, Beer-Sheva, Israel).

J. Phys. D (GB), vol.16, no.4, p.499-504 (14 April 1983).

High emission currents were achieved from a line electron thermionic source. The cathode was heated by electron bombardment from a secondary filament. Cathodes were built from massive strip made of tantalum or tungsten. Current densities were further increased by focusing the secondary electrons on to a narrow strip at the bottom of the cathode. The focus was achieved following a numerical model calculation. The design permitted the emitting surface temperature to be further increased, by keeping the cathode partially molten, in a reliable, continuous mode of operation. (5 refs.)

59880 Volume generation of H⁻ ions in plasmas. M.Bacal (Lab. de Phys.

des Milieux Ionisés, Ecole Polytech., Palaiseau, France).

Phys. Scr. (Sweden), vol.T2, no.2, p.467-78 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Göteborg, Sweden, 9-15 June 1982).

The generation of hydrogen and deuterium negative ions and beams is reviewed, with particular emphasis on volume production in plasmas, which has recently been found to be a useful element of possible high-power negative-ion-based neutral beam systems. The experimental evidence for volume production is based on the measurement of high density (5×10^{10} cm $^{-3}$) and high fractions (10-35%) of H⁻ and D⁻ ions in plasmas, using the photodetachment method, and on measurements of re-vibrational populations using coherent antiStokes Raman scattering (CARS). These measurements are discussed in terms of a theoretical model relying on the assumption that the dominant negative ion production process is the recently discovered dissociative electron attachment to highly vibrationally excited molecules. Photodetachment, CARS and extraction experiments performed in different magnetic multipole configurations are described; they indicate that the magnetic multipole may be a useful device for this application. (14 refs.)

59881 Three-electrode electrostatic deflection plates for low-energy charged beams. R.Grisenti (Istituto per la Ricerca Sci. e Tecnologica, CNR, Trento, Italy), A.Zecca.

Rev. Sci. Instrum. (USA), vol.54, no.4, p.505 (April 1983).

A simple system of electrostatic deflection plates with three electrodes is described. (no refs.)

07.80 ELECTRON AND ION MICROSCOPES AND TECHNIQUES

(see also in condensed matter 61.16D Electron microscopy, 61.16F Field ion microscopy)

59882 Three-dimensional profiling with the Sandia nuclear microprobe. B.L.Doyle, N.D.Wing (Sandia Nat. Labs., Albuquerque, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1214-19 (April 1983).

(1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A nuclear microprobe analysis system attached to Sandia's EN tandem Van de Graaff accelerator is described. A magnetic quadrupole doublet lens is used for the final focus and 2 μ m beam diameters have been obtained. Several illustrative applications of the microprobe, including the first three-dimensional concentration profiles using Rutherford backscattering and elastic recoil detection ever measured, are given. (14 refs.)

59883 Appraisal of a new charge correction method in X-ray photoelectron spectroscopy. S.Kohiki, T.Ohmura, K.Kusao (Materials Res. Lab., Matsushita Electric Industrial Co. Ltd., Moriguchi, Osaka, Japan).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.1, p.85-90 (April 1983).

The authors recently reported a new charge correction method in X-ray photoelectron spectroscopy (1983). They showed that the $2p_{3/2}$ binding energy (BE) of Ar implanted in insulating materials was 242.3 eV, and that this could be used to correct for charge shifts. It is expected that the value of BE_R (Ar $2p_{3/2}$, IM) will change with the variation of the detailed mechanism of extraatomic relaxation from ionic to covalent materials. They have studied the validity of the charge-referencing point Ar $2p_{3/2}$ =242.3 eV in insulating materials with varying bond ionicity. The compounds considered (BN, GaP, InP, BeO and NaCl) have been well characterized previously. (22 refs.)

59884 Calibration of transmission electron microscopic mass determination using objects with known mass distribution. P.W.J.Linders, A.L.H.Stols, A.M.Stadhouders (Inst. for Submicroscopic Morphology, Univ. of Nijmegen Medical School, Nijmegen, Netherlands).

J. Microsc. (GB), vol.130, pt.1, p.85-92 (April 1983).

An improved calibration procedure is described for dry mass determination methods, that are based on microdensitometry of transmission electron micrographs. Polystyrene latex spheres, that are supposed to have a homogeneous mass distribution, are used for the calibration procedure. By computer fitting of the theoretically expected mass distribution to the distribution measured in a line through the centre of a sphere, a mass calibration factor is obtained. The number of measurements required for a predetermined calibration accuracy can be decreased considerably as compared to other calibration methods. Accurate calibration and reproducible adjustment of the electron optical magnification are required. (27 refs.)

59885 Determination of the illuminating angle and defocus spread in transmission electron microscopy. M.Tsuiji, R.St. John Manley (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada).

J. Microsc. (GB), vol.130, pt.1, p.93-8 (April 1983).

In high resolution electron microscopy the beam divergence and defocus spread are important factors determining the resolution limit of the microscope. In this paper a straightforward method is proposed to estimate the illuminating angle (beam divergence) and the parameter of defocus spread using optical diffraction patterns from a through focal series of electron micrographs of a thin amorphous film. (18 refs.)

59886 Method for measuring the field from a magnetic recording head in the scanning electron microscope. O.C.Wells (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

J. Microsc. (GB), vol.130, pt.1, p.RP1-2 (April 1983).

Describes a field-plotting method in the SEM that is related to the 'Schlieren' imaging technique (Wells and Brunner, Appl. Phys. Lett., vol.42, p.114-6, 1983). (5 refs.)

59887 Study of scattering of gases of high energy electrons (0.5-3 MeV).

J.L.Balladore, D.Lapeyre, J.P.Martinez, J.Trinquier, B.Jouffrey (Lab. d'Optique Electronique, Univ. Paul Sabatier, Toulouse, France).

J. Microsc. & Spectrosc. Electron. (France), vol.7, no.6, p.575-92 (Dec. 1982). In French.

In electron microscopy the possibility of doing experiments in presence of gas is possible by using an environmental cell. In order to establish the conditions in which images should be obtainable with good contrast and resolution, the partial electron scattering cross sections with several gases at different pressures have been determined. (13 refs.)

59888 Magnetic-field-free vapor furnace for photoelectron spectroscopy. I. Temperatures up to 900K. G.Schönhense (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.419-21 (April 1983).

A vapor furnace producing stable atomic and molecular beams for photoionization experiments is described. During operation the furnace causes no detectable magnetic stray field because it is heated by a stream of hot air. Thus angle- and energy-resolved measurements of photoelectron spin polarization could be done at a kinetic energy as low as 0.5 eV. The high temporal stability of the target beam is demonstrated by means of an angular distribution measurement with mercury atoms. (8 refs.)

59889 Electron gun with a field-emission cathode for use in electron-probe instruments. B.N.Vasichev, Yu.L.Rybakov.

Sov. J. Opt. Technol. (USA), vol.49, no.8, p.516-19 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.44-7 (Aug. 1982). [received: April 1983]

It is shown that the largest emission current density in a given solid angle can be obtained with pulsed electron emission and optimum electron gun construction. A pulsed field emission gun ensures the largest probe current when the probe diameter ranges from 10 to 100 nm. (6 refs.)

59890 Electrostatic charged particle analyzer with three coaxial cylindrical electrodes. II. Construction of a three-stage system with a central electrode of finite thickness and axis-axis focusing. K.A.Men'shikov ('Kvant' Sci. & Industrial Union, Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1268-71 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2066-70 (Oct. 1982). [received: April 1983]

For pt.1 see Zh. Tekh. Fiz., vol.51, p.17-21 (1981). Sov. Phys. Tech. Phys., vol.26, p.8-11 (1981). A three-cylinder mirror analyzer is considered which has better optoelectronic characteristics than the widely used cylindrical mirror analyzers. Calculated results are reported for a system with a middle cylinder of thickness greater than or comparable to the distance over which optoelectronic images are smeared by aberration effects. (Such systems are easier to work with and more general than the one considered in pt.1). It is shown that the thickness of the middle cylinder must be minimal for best performance. (3 refs.)

59891 Imaging XPS—a new technique. I. Principles. N.Gurker, M.F.Ebel, H.Ebel (Inst. fur Angewandte und Tech. Phys., Tech. Univ. Wien, Wien, Austria).

Surf. & Interface Anal. (GB), vol.5, no.1, p.13-19 (Feb. 1983).

XPS imaging promises to be a powerful analytic tool because it enables specific information on both elements and bonding to be recorded on a two-dimensional distribution map. The only scanning XPS method to date which has been found to be practical is essentially a scanned-particle-beam method, like scanning AES, and it is only applicable to thin film specimens. The basic ideas of the new imaging XPS technique is presented based on a quite different concept. It will be applicable to any kind of specimen that can be analysed in a conventional XPS system. It makes use of the dispersion properties of a spherical condenser-type spectrometer and applies a two-dimensional electron detection device for decoding the energy and emission position of an analysed photoelectron. Experimental arrangement and theory of operation are presented. (9 refs.)

59892 Trace structure analysis, ptychography, phase tomography. W.Hoppe (Max-Planck-Inst. fur Biochem., Martinsried, Germany).

Ultramicroscopy (Netherlands), vol.10, no.3, p.187-98 (1982).

Three papers dedicated to the author elicit further comment from his own engagement with the three topics—trace structure analysis ptychography and phase tomography. (50 refs.)

59893 Secondary electron imaging as an aid to STEM microanalysis. R.M.Allen (Sandia Nat. Labs., Livermore, CA, USA).

Ultramicroscopy (Netherlands), vol.10, no.3, p.237-45 (1982).

Secondary electron (SEM mode) imaging in a scanning transmission electron microscope (STEM) has been utilized as an aid to the STEM microanalysis of second phase particles in an Alloy 800 foil by identifying particles at the foil surface facing the incident beam and energy dispersive X-ray detector. Such particles were optimally situated for microanalysis because possible

deleterious effects from beam spreading and matrix absorption were eliminated. This was demonstrated by orienting the sample to analyze the particles on the surface of the foil facing away from the beam and X-ray detector, and subsequently, for comparison, reorienting the sample to reanalyze the particles with the foil surface facing beam and detector. Theoretical calculations of the magnitude of the relative change in particle X-ray signal between the two orientations were in good agreement with the experimental observations. SEM imaging also provided surface reference points for parallax-effect measurements of local foil thickness and particle depth within the foil. (18 refs.)

59894 A new electrostatic phase-shifting effect. G.Matteucci, G.F.Missiroli, G.Pozzi (Istituto di Fisica, Univ. di Bologna, Bologna, Italy). *Ultramicroscopy (Netherlands)*, vol.10, no.3, p.247-51 (1982).

The authors investigate the electron optical properties of the electrostatic field arising from a metallic wire, coated with a different metal in the direction perpendicular to the electron beam. By electron interferometry it is shown that the wire introduces a constant phase difference between the interfering beams. (10 refs.)

59895 Periodic images produced by random noise and a filter. T.tanji, H.Hashimoto, H.Tomioka (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan). *Ultramicroscopy (Netherlands)*, vol.10, no.3, p.281-3 (1982).

The optical spatial filtering method has been of value for high resolution electron microscopy, especially the application of noise filters with periodic hole arrays (Dirac combs) which are very useful in eliminating random noise in the micrograph of a periodic object. A filter located in the diffraction plane of the imaging lens may be used to pass mainly those beams diffracted by the periodic structures and hardly any of those scattered by random noise in the object micrograph. The authors show the images of random scatterers, which are formed by using such a filter with a periodic hole array, and which are then compared with a calculation based on the theory of speckle noise. (6 refs.)

59896 Thickness dependence of the STEM ratio image. R.F.Egerton (Dept. of Phys., Univ. of Alberta, Edmonton, Canada). *Ultramicroscopy (Netherlands)*, vol.10, no.3, p.297-9 (1982).

The author investigates the dependence of the ratio signal upon specimen thickness; in particular, the contrast produced by small variations in thickness. Modifications of the technique are then suggested, which should render the image less sensitive to thickness changes, particularly in the case of thicker specimens. (10 refs.)

07.85 X-RAY, GAMMA-RAY INSTRUMENTS AND TECHNIQUES

59897 A microprocessor controlled spectrometer for thermal scan Mossbauer spectroscopy. G.Nolle, H.Ullrich, J.B.Muller, J.Hesse (Inst. A fur Phys., Tech. Univ., Braunschweig, Braunschweig, Germany). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.459-63 (1 April 1983).

To determine the ordering temperature of ferromagnetic alloys using Mossbauer effect, a 'thermal scan' the measurement of counting rate at the center of gravity of the spectrum is necessary. The authors present a low cost micro-computer controlled system, which sets up the temperatures, takes the spectra and evaluates the ordering temperature from a sequence of measurements. As an example the Curie temperatures of disordered FCC FePt-Invar alloys are given. (3 refs.)

59898 The stability of cesium iodide X-ray photocathodes. K.Premaratne, E.R.Dietz, B.L.Henke (Univ. of Hawaii, Honolulu, HI, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.465-7 (1 April 1983).

For pulsed X-ray measurements as applied, for example, in high temperature plasma diagnostics, it has been established that the cesium iodide photocathode is very efficient for X-ray diode and streak camera applications. Its quantum yield (electrons/incident photon) is ten to one-hundred times higher than that for the gold photocathode in the 100-10000 eV region. The width of its secondary electron energy distribution is appreciably less than that for gold, allowing time resolved, streak camera measurements to be extended into the picosecond region. An experimental study is described which demonstrates that the cesium iodide photocathode quantum yield and secondary electron energy distribution can be stable under practical conditions of preparation, handling, storage and short period exposures to the atmosphere. (10 refs.)

59899 Utilization of MeV Van de Graaff electrons to produce characteristic X-rays for precision measurements. E.G.Kessler, Jr., R.D.Deslattes (Quantum Metrology Group, NBS, Washington, DC, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.991-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Electrons from a 4 MeV Van de Graaff accelerator are used to produce intense sources of characteristic X-rays from a sampling of mid-to-high Z elements. Thick solid targets and high pressure gas samples are bombarded by up to 50 microamperes of 2.5 MeV electrons. The X-rays are viewed in the backward direction to reduce the background resulting from bremsstrahlung radiation. Wavelengths and widths of the X-rays are measured with a precision two-axis flat crystal spectrometer. (19 refs.)

59900 Continuous X-ray-induced Auger electron spectroscopy. J.Cazaux (Lab. de Spectroscopie des Electrons, UER Sci., Reims, France), Tran Minh Duc.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.1, p.13-23 (April 1983).

Bremsstrahlung emission from a tungsten anode has been used, for the first time, to obtain X-ray-induced Auger electron spectra (CXAES) in a conventional X-ray photo-electron spectrometer. Auger KLL signal and background intensities obtained from a silicon-aluminium sample have been compared with those obtained under the same experimental conditions but using a standard aluminium anode. For such an aluminium anode, the respective contributions of the bremsstrahlung and the characteristic radiation to the C_{KVV} intensity have also been established. (15 refs.)

07.90 OTHER TOPICS IN SPECIALISED INSTRUMENTATION

59901 Using the 'C' programming language for interface control.

N.J.Goddard (Dept. of Chem., Imperial Coll., London, England).

Lab. Microcomput. (GB), vol.1, no.3, p.15-22 (Autumn 1982).

Discusses the advantages of various programming languages to replace BASIC for controlling spectroelectrochemical apparatus via a home-made interface. It is shown that C is not only faster than BASIC but is also easier to program and can dispense with assembly language routines. (7 refs.)

11.10 FIELD THEORY

59902 A discussion on the classical solution of gauge theory. Ming Zhong Wang (Chengdu Univ. of Sci. & Technol., Sichuan, China), Ruan Tunan.

AIP Conf. Proc. (USA), no.95, p.362-4 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

This paper deals with the classical solutions of pure gauge theory. The authors pay special attention to the problem of the electric solution and point out the fact that the only electric solution which was discovered in 1962 may be wrong. (9 refs.)

59903 Equivalence of stochastic and canonical quantization in perturbation theory. E.Floratos (ITP, Univ. of Bern, Switzerland), J.Iliopoulos.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.3, p.392-404 (18 April 1983).

It is shown that the stochastic quantization method introduced by Parisi and Wu (1981) reproduces, order by order, the ordinary perturbation expansion. The proof is valid for any field theory, including gauge theories, provided one considers gauge-invariant quantities. (8 refs.)

59904 First-order equations for gauge fields in spaces of dimension greater than four. E.Corrigan, C.Devchand, D.B.Fairlie (Dept. of Math. Sci., Univ. of Durham, Durham, England), J.Nuyts.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.3, p.452-64 (18 April 1983).

Considers the possibility of satisfying the gauge field equations in dimensions greater than four by imposing linear relations amongst the components of the field strength tensor, $F_{\mu\nu}$, generalising the idea of self-duality in four dimensions. (6 refs.)

59905 Towards a semi-classical approximation of the nonlinear σ -model.

A.Poitrascioiu, A.Rouet (Inst. for Advanced Study, Princeton, NJ, USA).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.3, p.481-90 (18 April 1983).

The authors consider the contribution of instantons of arbitrary topological charge to the expectation value of any observable in the CP¹ model defined on the sphere S². They replace the integration over one of the parameters of the instantons by an integration over the group of isospin transformations and carry it out explicitly by using the isospin invariance. This allows one to express the results as the expectation value of an observable of a neutral gas

of 2 species of particles, computed in the grand canonical ensemble. The interactions are complicated and involve multi-body forces ($2 \times k$, k being the topological charge). (5 refs.)

59906 A study of 't Hooft and Wilson loops. S.Samuel (Dept. of Phys., Columbia Univ., New York, NY, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.3, p.532-46 (18 April 1983).

An investigation is undertaken for 't Hooft loop operators in four-dimensional gauge theories. For the first time, a perimeter law is shown to be their behaviour in weak coupling Wilson lattice (and continuum) nonAbelian $SU(N)$ gauge theories for all N . However, it is also argued that this perimeter law is a poor criterion for quark confinement. Rather, it is suggested that non-leading long-distance behavior is what is crucial and relevant in distinguishing nonAbelian from Abelian (and hence confining from nonconfining) theories. A new object, 'the 't Hooft line', is introduced to measure this nonleading behaviour and is computed in strong coupling on the lattice. There, one finds magnetic screening, characterized by a magnetic screening mass, m_σ . It is shown to all orders in strong coupling that m_σ is the glueball mass, a result which is expected to persist in weak coupling and in the continuum. Two further consequences of this work are that pure nonAbelian gauge theories cannot be in a Higgs phase and that in such models that absence of massless physical particles implies confinement. Finally, nonleading behaviour in Wilson loops is examined. The present picture of confinement suggests the absence of van der Waals forces in Yang-Mills theories. (16 refs.)

59907 Vacuum instability criterion in an effective potential approach. A.Amer, A.E. Yaouanc, L.Oliver, O.Pene, J.-C.Raynal (Lab. de Phys. Theorique et Hautes Energies, Orsay, France). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.2, p.299-316 (11 April 1983).

The authors propose a definition of the effective potential of a fermion bilinear in field theory that allows them to specify the meaning of the Bogoliubov-Valatin variational method. They show the link of this definition with the usual one in terms of external sources. Then, they expose a method to obtain the instability equation of the chiral invariant vacuum from the quark-gluon interaction in QCD. They obtain, for one-gluon exchange in the Coulomb gauge, a critical coupling $4/3\alpha_{crit} = \pi/(3\pi-4)$. For $\alpha_s > \alpha_{crit}$ the chiral invariant vacuum is unstable. This takes into account transverse gluon exchange, and is to be compared with $4/3\alpha_{crit} = 1$ in the Coulomb approximation, a value that can also be obtained by the Bogoliubov-Valatin variation method. (8 refs.)

59908 Auxiliary field-free supersymmetric gauges. I.Antoniadis (Ecole Polytech., Palaiseau, France), E.Floratos. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.2, p.350-6 (11 April 1983).

The authors find that, in perturbation theory, nonlight-cone axial gauges, $N_A(x)=0$, preserve the supersymmetry remaining in $N=1$ supersymmetric YM theories, after imposing the Wess-Zumino gauge. (11 refs.)

59909 Two-loop β functions for scalar fields: a simplified approach. T.Murphy (Dublin Inst. for Advanced Studies, Dublin, Ireland). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.2, p.357-68 (11 April 1983).

A new, simplified method for calculating the renormalization group equations for scalar fields is presented. The method is based on the renormalization of the effective potential as a whole. The two-loop equations for a general theory are given, and the example of the adjoint representation of $SU(n)$ is considered in detail. It is found to differ substantially from the more common example of the fundamental representation. (8 refs.)

59910 One-loop renormalisation of superfield Yang-Mills theories. J.W.Juer, D.Storey (Dept. of Phys., Univ. of Southampton, Southampton, England).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.1, p.185-208 (25 April 1983).

The authors calculate the one-loop ultraviolet and infrared divergences in superfield Yang-Mills theories to fourth order in the gauge field. The ultraviolet divergences require a non-linear field renormalisation, and graphs with external ghost fields show that a non-linear renormalisation of the gauge-fixing function is also needed. These observations are confirmed by calculations incorporating matter fields, which are used to extend the result to all orders for the special case of $SU(2)$. On the other hand the infrared divergences, which occur in general gauges, are apparently impossible to remove in any acceptable way. (11 refs.)

59911 The composite particle representation theory. I. The composite particle representation transformation. Cheng-Li Wu (Dept. of Phys., Jilin Univ., Changchun, China), Da Hsuan Fang. *Commun. Theor. Phys. (China)*, vol.1, no.6, p.705-24 (1982).

A generalization of the quantum mechanical representation transformation is presented. It is shown that, as an important example, the Boson-expansion method, commonly employed in nuclear physics, corresponds to such a generalized transformation. Using this generalization, the authors were able to construct a special representation called the 'Composite Particle Representation'. In the composite particle representation, the composite particle degrees of freedom are included, as well as the original particle degrees of freedom. The former is introduced in order that the motion of certain particle clusters can be described as separate entities in a many-body system. This representation is shown to be exactly equivalent to the usual quantum mechanical representation which includes only the original particle degrees of freedom. Many applications of this theory are expected, in particular in the study of hadrons from the quark point of view and the Interacting Boson Model in nuclei. (10 refs.)

59912 Lattice formulation of the pure gauge fields on coset space. Ruan Tunan, Jin Sicong, Liu Zuwei (Univ. of Sci. & Technol. of China, Hefei, China).

Commun. Theor. Phys. (China), vol.2, no.1, p.867-76 (1983).

The authors construct a lattice formulation for pure gauge fields in a coset space in the cases of a group with a nontrivial topological property and of a chiral group, and they present a local gauge invariant action of a quark system on a four-dimensional Euclidean space lattice, which has the continuum limit as usual. For nonchiral groups with a trivial topological property, it is shown that the coset pure gauge fields have no influence on the confinement properties of the quark system, by calculating the lattice current-current propagator when the coset pure gauge fields are retained manifestly. (4 refs.)

59913 On realization of the chiral symmetry in the lattice gauge theory containing the $U(1)$ chiral gauge field. An Ying, Chen Shi, Dai Yuan-ben (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.2, no.1, p.877-82 (1983).

The authors investigate the lattice gauge theory with a gauge group $U \times V(1)$ where U is a nonAbelian group and $V(1)$ is a chiral Abelian group. In the

strong coupling approximation for the U gauge field they find that the $V(1)$ chiral symmetry is realised through parity doublets of composite fermions for strong $V(1)$ coupling and that it is spontaneously broken through a technicolor-like mechanism for weak $V(1)$ coupling. (7 refs.)

59914 General solution and Lax Pair for 1-D classical massless Thirring model. M.Wadati (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1084-5 (April 1983).

Classical massless Thirring model in one dimensional space is studied. The general solution and Lax pair are explicitly presented. Both results imply that the system is completely integrable. (1 ref.)

59915 Nonintegrability of the classical Yang-Mills fields. E.S.Nikolaevskii, L.N.Shur (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).

JETP Lett. (USA), vol.36, no.5, p.218-21 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.5, p.176-9 (5 Sept. 1982). [received: April 1983]

It is shown for the particular case of the classical Yang-Mills equations that there is no additional first integral. It is concluded that the original system of equations does not have a complete set of integrals. (9 refs.)

59916 Crossover from the strong-coupling to the weak-coupling regime in the $SU(2)$ -symmetric Thirring model. G.I.Japaridze, A.A.Nersesyan (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR), P.B.Wiegmann.

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.254-8 (21 March 1983).

Using the exact solution of the Thirring model with broken $SU(2)$ symmetry the authors study a transition from the strong-coupling to the weak-coupling regime taking place on changing the anisotropy parameter. (14 refs.)

59917 On self-dual gauge fields arising from twistor theory. N.M.J.Woodhouse (Wadham Coll., Oxford, England).

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.269-70 (21 March 1983).

Some simple expressions are given for the solutions to the self-dual Yang-Mills equations associated with certain linear zero-rest-mass fields. (7 refs.)

59918 Unique trajectory method in Migdal renormalization group approach and crossover phenomena. M.Imachi, S.Kawabe, H.Yoneyama (Dept. of Phys., Kyushu Univ., Fukuoka, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.221-34 (Jan. 1983).

Migdal renormalization group approach, combined with Wilson-Kogut topological argument, is applied to four dimensional lattice gauge theory of finite subgroup $I(120)$ of $SU(2)$. i) A slight but clear crossover from strong coupling regime to weak coupling regime is observed for the Wilson action. ii) For mixed action, of the fundamental and the adjoint representation, a clearer stepwise transition is found at $1 \leq \beta_a \leq 3$ (where β_a denotes the bare inverse coupling constant of the adjoint representation). This stepwise transition changes into crossover for smaller β_a . iii) There are four critical lines in (β_a, β_b) plane starting from a quadrupole point ($\beta_a^* \sim 0.75$, $\beta_b^* \sim 3.2$) where β_b denotes the bare inverse coupling constant of the fundamental representation: $SQ(3)$ critical line; $Z(2)$ critical line; a critical line due to the discreteness of $I(120)$; and a critical line related to crossover. (15 refs.)

59919 On the relation of first-class constraints to gauge degrees of freedom. R.Sugano (Dept. of Phys., Osaka City Univ., Osaka, Japan), T.Kimura.

Prog. Theor. Phys. (Japan), vol.69, no.1, p.252-61 (Jan. 1983).

A further consideration is made to support the proposition, given in a previous paper (1982), that only intrinsic first class constraints are associated with gauge degrees of freedom. The authors' argument is based on the consistency requirement between the Lagrangian and the Hamiltonian formalisms, reducibility conditions of gauge degrees of freedom and gauge fixing conditions in the quantization procedure by means of the Dirac bracket method. (11 refs.)

59920 A spinor reconstruction theorem. Y.Takahashi (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.369-71 (Jan. 1983).

The reconstructibility of a spinor via the Pieri identities is discussed in non-relativistic as well as relativistic cases. (5 refs.)

59921 Convergent perturbation theory for the scalar $\phi^2 p$ field theories; the Gell-Mann-Low function. B.S.Shaverdyan, A.G.Ushveridze (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR).

Phys. Lett. B (Netherlands), vol.123B, no.5, p.316-18 (7 April 1983).

A method of construction of convergent perturbation theory for the scalar $\phi^2 p$ field theories is proposed. The method can be used for calculations in the strong coupling regime. The behavior of the Gell-Mann-Low function for ϕ^4 field theory is studied. (6 refs.)

59922 Matter field and fermions in $OSP(4/2)$ by dimensional reduction via superspace. R.Delbourgo, R.J.Farmer, P.D.Jarvis (Dept. of Phys., Univ. of Tasmania, Hobart, Australia).

Phys. Lett. B (Netherlands), vol.123B, no.5, p.319-22 (7 April 1983).

Coset space methods are applied to obtain a dimensionally reduced superfield formulation of quantized gauge theory. Matter fields, including fermions are incorporated in the formalism by appropriate tensor or spinor representations of $OSP(4/2)$. (18 refs.)

59923 The ultra-violet finiteness of the $N=4$ Yang-Mills theory. L.Brink (California Inst. of Technol., Pasadena, CA, USA), Ö.Lindgren, B.E.W.Nilson.

Phys. Lett. B (Netherlands), vol.123B, no.5, p.323-8 (7 April 1983).

The $N=4$ supersymmetric Yang-Mills gauge theory was formulated by the authors in a previous paper (1982) in the light-cone gauge. It is described by a scalar complex superfield whose components are the propagating field components of the theory. Here they prove that the theory is ultra-violet finite to all orders in perturbation theory for a specific form of the light-cone gauge. (11 refs.)

59924 Super-self duality for supersymmetric Yang-Mills theory. I.V.Volovich (Steklov Math. Inst., Moscow, USSR).

Phys. Lett. B (Netherlands), vol.123B, no.5, p.329-31 (7 April 1983).

Super-selfduality equations for supersymmetric Yang-Mills theory are proposed. The solution of these equations with the help of super-twistors is presented. (11 refs.)

59925 On the dynamics of tumbling gauge theories. V.P.Gusynin, V.A.Miransky, Yu.A.Sitenko (Inst. for Theoretical Phys., Kiev, USSR).

Phys. Lett. B (Netherlands), vol.123B, no.6, p.407-12 (14 April 1983).

The dynamics of symmetry breaking in gauge theories without fundamental scalars is investigated. The method of determining the way of the vacuum rearrangement in these theories is elaborated. (12 refs.)

59926 Universality violation and large N interpolations. Tian-iun Chen, Chung-i Tan, Xi-te Zheng (Dept. of Phys., Brown Univ., Providence, RI, USA).

Phys. Lett. B (Netherlands), vol.123B, no.6, p.423-7 (14 April 1983).

The restoration of universality based on a large N motivated asymptotically free scaling formula is re-examined. A mixed $SU(N)$ - $SU(N)/Z_2$ system which serves as a counter-example to the reduction scheme of Grossman and Samuel

(1982) is studied. However, a certain general universal pattern for the constant string tension lines is observed. (10 refs.)

59927 The connection between local operators on the lattice and in the continuum and its relation to meson decay constants. G.Martinelli (INFN, Lab. Nazionali di Frascati, Frascati, Italy), Yi-cheng Zhang. *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.433-6 (14 April 1983).

The authors have computed, at first order in perturbation theory, the relation between lattice and continuum local operators used in Monte Carlo simulations to evaluate the meson decay constants. These corrections, although with the correct sign, are too small to compensate the discrepancy between existing lattice calculations and experimental values. (11 refs.)

59928 Fermion coupled with vortex with dyon excitation. S.Aoyama, Y.Fujimoto (ICTP, Trieste, Italy). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.740-8 (21 April 1983).

A system of fermions and a vortex with a dyonic excitation is studied in the context of SU(2) gauge theory. Many of the features of the theory turn out to be similar to those obtained by Callan (1982) and Rubakov (1981) in their recent study of the dyon. The main difference is that the number of fermion states is double and thus a new type of scattering can take place. (12 refs.)

59929 Gauge bosons as composites of fermions. K.G.Akdeniz (Theoretical Phys. Inst., Univ. of Istanbul, Istanbul, Turkey), M.Arik, M.Hortacsu, N.K.Pak. *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.79-82 (21 April 1983).

Non-Abelian gauge theories are obtained as effective theories of certain models which at the Lagrangian level contain only spinor fields. (8 refs.)

59930 Spin-isospin mixing without spontaneous symmetry breakdown. A.Mukherjee, P.Roy (Tata Inst. of Fundamental Res., Bombay, India). *Z. Phys. C (Germany)*, vol.17, no.2, p.141-4 (1983).

The phenomenon is demonstrated in an exactly symmetric SU(2) classical gauge theory with a scalar isodoublet of matter fields. Possible implications for chromodynamics are discussed briefly. (12 refs.)

59931 Stochastic processes and Fermi fields. G.F.de Angelis (Centre de Phys. Theorique, CNRS, Marseille, France), D.de Falco.

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.56-66

Reports on some results pointing to the possibility of introducing ordinary probability in the analysis of Fermi fields. Using a specific example of a Fermi oscillator, the authors give a Feynman-Kac formula for the Hamiltonian subgroup, a path integral representation of the configurational Schwinger functions and a complete characterisation of the dynamics in terms of stochastic field equations. These expressions are given in terms of ordinary numerical valued Markov processes. (5 refs.)

59932 Lagrangians with anticommuting arguments for Dirac fields. P.Kree (Inst. de Math., Univ. de Paris 6, Paris, France).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.254-73

Extends classical Lagrangian theory to the case of a free variable π , which can take the value $-$ or $+$ for commuting and anticommuting formulations. The calculus for functionals with anticommuting arguments is developed, used to extend the Euler-Lagrange equations, an action theorem is proved and the results are applied to Dirac fields. 11.20 S-MATRIX THEORY

59933 On the nonrelativistic S-matrix. E.F.Hefter (Inst. fur Theoretische Phys., Univ. Hannover, Hannover, Germany).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.329-32 (Jan. 1983).

Attention is drawn to the older literature results from which it follows immediately that the S-matrix for the Korteweg-de Vries equation (KdV) and for the related (stationary multicomponent) nonlinear Schrodinger equation factorizes. (9 refs.)

Exact solution of the Dirac equation in the field of a 't Hooft-Polyakov monopole See Entry 59963

11.30 SYMMETRY AND CONSERVATION LAWS

(see also 02.20 Group theory)

59934 Measurements of CP-violating polarization of muons from K_{s3} decays. R.K.Adair (Yale Univ., New Haven, CT, USA).

AIP Conf. Proc. (USA), no.95, p.130-8 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

Two experiments, conducted at Brookhaven National Laboratory, are described which were directed towards the measurements of the polarization normal to the plane of decay of muons produced in K_{s3} decays; measurements were made on the decays of K^+ and K_L^0 mesons. The value of the polarization derived from summing the results of both experiments is $P_n = (-1.85 \pm 3.60) \times 10^{-3}$ in the direction $p_K X p_{\mu}$, where the limits are of the magnitude to be expected from certain interesting models. (11 refs.)

59935 Parity violation in non-weak processes. M.Simonius (Lab. fur Kernphys., ETH, Zurich, Switzerland).

AIP Conf. Proc. (USA), no.95, p.139-49 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

Parity violation in non-weak processes is reviewed with emphasis on recent developments. Effects in electron-hadron systems are summarized briefly. Parity violation in purely hadronic systems and the status of its theoretical analysis is treated in more detail. (44 refs.)

59936 Parity nonconservation in proton-water scattering at 800 MeV. D.E.Nagle, J.D.Bowman, R.Carlini, R.E.Mischke (Los Alamos Nat. Lab., Los Alamos, NM, USA), H.Frauenfelder, R.W.Harper, V.Yuan, A.B.McDonald, R.Talaga.

AIP Conf. Proc. (USA), no.95, p.150-5 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

A search has been made for parity nonconservation in the scattering of 800 MeV polarized protons from an unpolarized water target. The result for the longitudinal asymmetry is $A_L = +(6.6 \pm 3.2) \times 10^{-7}$. Control runs with Pb, using a thickness that gave equivalent beam broadening from multiple Coulomb scattering, but a factor of ten less nuclear interactions than the water target, gives $A_L = -(0.5 \pm 6.0) \times 10^{-7}$. (11 refs.)

59937 Parity violations in high energy nucleon nucleon scattering. G.Nardulli (Istituto di Fisica, Univ. di Bari, Bari, Italy).

AIP Conf. Proc. (USA), no.95, p.156-8 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

It is shown that, using parity violating nucleon wave function effects, large asymmetries in the scattering of polarized nucleons at large energies naturally arise. (7 refs.)

59938 The one-loop effective potential in superspace. M.T.Grisaru (California Inst. of Technol., Pasadena, CA, USA), F.Riva, D.Zanon.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.3, p.465-80 (18 April 1983).

Using superfields and supergraphs the authors evaluate the superspace one-loop effective potential for several supersymmetric models: self-interacting chiral superfields, supersymmetric Yang-Mills, and supersymmetric QED. (7 refs.)

59939 The relaxed hypermultiplet: an unconstrained $n=2$ superfield theory. P.S.Howe (CERN, Geneva, Switzerland), K.S.Stelle, P.K.Townsend.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.3, p.519-31 (18 April 1983).

The authors present an off-shell version of the hypermultiplet, without a central charge or gauge antisymmetric tensors. They give the unconstrained superfield form of the action and its coupling to $N=2$ super-Yang-Mills theory. This allows an $N=2$ superspace formulation of the $N=4$ super-Yang-Mills theory whose ultraviolet finiteness is then ensured by $N=2$ nonrenormalization theorems. (15 refs.)

59940 Note on extremes of SU(n) Higgs potentials. Cao Chang-qi (DESY, Hamburg, Germany).

Commun. Theor. Phys. (China), vol.2, no.1, p.913-19 (1983).

The problem of symmetry breaking of SU(n) is discussed more completely with Higgs scalar fields belonging to an adjoint representation or an adjoint together with a fundamental one. (2 refs.)

- 59941 Weight vector representatives for $SO(2N)$.** S.K.Soni (Univ. of Pennsylvania, Philadelphia, PA, USA). *J. Math. Phys. (USA)*, vol.24, no.4, p.729-35 (April 1983). Following Mohapatra and Sakita (1980), it is convenient to rewrite the algebra of $2N$ -matrices in terms of N annihilation operators and N creation operators. The author finds them useful in representing vector fields in the spinorial $\sigma_N + \sigma_N^c$ and the irreducible subcomponents of $\sigma_N \times \sigma_N$ and $\sigma_N \times \sigma_N^c$ operators. Though their Dynkin labels are readily accessible, a natural basis for the enumeration of their complete set of weights is given by N positive weights of the vectorial representation. Their subgroup content under $SU(N) \subset SO(2N)$ and $SO(2m) \otimes SO(2N-2m) \subset SO(2N)$ is made obvious by using a simple identity. Conjugation and Yukawa couplings are touched on briefly. (6 refs.)
- 59942 A theorem on orbit structures (strata) of compact linear Lie groups.** G.Sartori (Istituto di Fisica, Univ. di Padova, Padova, Italy). *J. Math. Phys. (USA)*, vol.24, no.4, p.765-8 (April 1983). The author presents a comprehensive constructive proof of a theorem characterizing the tangent space to a stratum (orbit structure) of the Euclidean space R^n , seat of an orthogonal representation of a compact group G . The characterization is made in terms of gradients of a complete set (integrability basis) of G -invariant polynomials. In a recent paper (Abud and Sartori, 1981), the theorem, which may be considered a generalisation of a theorem by Michel (1971), has been shown to be effective in the determination of the equations of the strata and in the determination of natural extrema of G -invariant functions. (10 refs.)
- 59943 Internal labels of degenerate representations.** T.H.Seligman (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France), R.T.Sharp. *J. Math. Phys. (USA)*, vol.24, no.4, p.769-71 (April 1983). An expression for the number of internal labels of degenerate irreducible representations of compact semisimple Lie groups is given in the same spirit as Racah's formula (1965) for the nondegenerate case. (5 refs.)
- 59944 Analysis of the outer product for the symmetric group.** L.J.Somers (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands). *J. Math. Phys. (USA)*, vol.24, no.4, p.772-8 (April 1983). Expressions are derived to write the basis vectors for an irreducible representation μ of the symmetric group in terms of basis vectors for irreducible representations whose outer product yields μ . (7 refs.)
- 59945 Reciprocal transformation for one-dimensional conservation equations.** G.Rosen (Dept. of Phys. Drexel Univ., Philadelphia, PA, USA). *J. Math. Phys. (USA)*, vol.24, no.4, p.793-4 (April 1983). One-dimensional conservation equations (OCE) of the form $\partial n/\partial t + \partial f/\partial x = 0$ with $n=n(x,t) > 0$ and $f=f(n, \partial n/\partial x, \partial^2 n/\partial x^2, \dots)$ admit a symmetric reciprocal transformation $x \rightarrow x^*(x,t)$, $n \rightarrow n^*(x^*,t) \equiv n$, $f \rightarrow f^* \equiv -n^2 f$, which produces an equivalent OCE for n^* in x^* space. Certain OCE of contemporary interest are reciprocal invariant in the sense that $f^* = f(n^*, \partial n^*/\partial x^*, \partial^2 n^*/\partial x^{*2}, \dots)$. There also exists a class of essentially nonlinear OCE for which the reciprocal transformation produces a linear OCE, and thus equations in this class are solvable analytically. (5 refs.)
- 59946 Lie transformations, nonlinear evolution equations, and Painleve forms.** M.Lakshmanan, P.Kaliappan (Dept. of Phys., Univ. of Madras, Madras, India). *J. Math. Phys. (USA)*, vol.24, no.4, p.795-806 (April 1983). The authors present the results of a systematic investigation of invariance properties of a large class of nonlinear evolution equations under a one-parameter continuous (Lie) group of transformations. It is shown that, in general, the corresponding invariant variables (the subclass of which is the usual similarity variables) lead to ordinary differential equations of Painleve type in the case of inverse scattering transform solvable equations as conjectured by Ablowitz, Ramani, and Segur. This is found to be also true for certain higher spatial dimensional versions such as the Kadomtsev-Petviashvili, two dimensional sine-Gordon, and Ernst equations. For the non-solvable equations considered here this invariance study leads to ordinary differential equations with movable critical points. (39 refs.)
- 59947 Supersymmetric equilibrium.** E.Alvarez (Joseph Henry Labs., Princeton Univ., Princeton, NJ, USA), M.B.Gavela. *Lett. Nuovo Cimento (Italy)*, vol.36, ser.2, no.14, p.467-70 (2 April 1983). A generalized canonical ensemble for supersymmetric systems is introduced assuming that the fundamental conserved quantity is the supersymmetric charge. Some relevant thermodynamic quantities are studied. (3 refs.)
- 59948 Spontaneously broken supersymmetry and Poincare invariance.** X.R.Tata, E.C.G.Sudarshan (Dept. of Phys., Univ. of Texas, Austin, TX, USA), J.M.Schechter. *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.308-10 (7 April 1983). It is argued that the spontaneous breakdown of global supersymmetry is consistent with unbroken Poincare invariance if and only if the supersymmetry algebra $\mathcal{A}=0$ is understood to mean the invariance of the dynamical variables ϕ under the transformations generated by the algebra, i.e. $[\mathcal{A}, \phi]=0$ rather than as an operator equation. It is further argued that this 'weakening' of the algebra does not alter any of the conclusions about supersymmetry quantum field theories that have been obtained using the original (stronger) form of the algebra. (6 refs.)
- 59949 Spontaneous breakdown of supersymmetry due to gauge interactions.** T.Inami (Inst. of Phys., Univ. of Tokyo-Komaba, Tokyo, Japan), C.S.Lim, N.Sakai. *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.311-15 (7 April 1983). Presents a new type of spontaneous supersymmetry breakdown at the tree level arising from gauge interactions irrespective of the specific forms of the superpotential. Explicit models are considered for groups $SU(N) \times U(1)$. The existence of an unbroken $U(1)$ gauge symmetry is found to be a general feature of this type of model. (13 refs.)
- 59950 Spontaneous breakdown of supersymmetry and charge confinement.** Z.F.Ezawa, A.Iwazaki, M.Sato (Dept. of Phys., Tohoku Univ., Sendai, Japan). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.40-4 (21 April 1983). It is argued that charges are confined in supersymmetric theories only if supersymmetry is spontaneously broken. The authors demonstrate this explicitly in a 1+1 dimensional model which has both supersymmetric and broken-supersymmetric phases. (6 refs.)
- 59951 Comment on the proof of existence of the Nicolai mapping for scalar supersymmetric theories.** M.F.L.Golterman (Inst. for Theoretical Phys., Utrecht, Netherlands). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.51-4 (21 April 1983). It is pointed out that there exists a difficulty in the proof of existence of Nicolai's (1980, 81) transformations of the bosonic fields in supersymmetric theories, which has so far not been resolved. Also the generalization of the proof, which was given for the case of one bosonic field, to the case of more fields is not trivial. (4 refs.)
- 59952 A class of finite four-dimensional supersymmetric field theories.** P.S.Howe (Dept. of Math., King's Coll., London, England), K.S.Stelle, P.C.West. *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.55-8 (21 April 1983). A class of $N=2$ supersymmetric models consisting of $N=2$ Yang-Mills coupled to $N=2$ matter is shown to be finite to all orders of perturbation theory. For this to hold, the representation of the matter fields must be chosen to give a vanishing one-loop β -function. General $N=2$ supersymmetric models have a β -function that is determined to all orders in perturbation theory by the one-loop contribution. (15 refs.)
- 59953 A simple component field method for SUSY effective potential calculations.** R.D.C.Miller (GERN, Geneva, Switzerland). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.59-63 (21 April 1983). S. Weinberg's tadpole method (1973) for the calculation of effective potentials of conventional field theories also provides an attractive means for calculating SUSY effective potentials. The essential trick is to leave the SUSY unconstrained and consider auxiliary field tadpoles. The method is illustrated for the Wess-Zumino model. (13 refs.)
- 59954 The pionino: an argument against the massless gluino.** M.J.Eides, M.J.Vysotsky (Inst. of Theoretical & Experimental Phys., Moscow, USSR). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.83-4 (21 April 1983). Demonstrates that spontaneous R-invariance breaking in a low energy SUSY theory inevitably leads to an extra light pseudoscalar boson (pionino). As this possibility is experimentally excluded the R-invariance has to be broken explicitly, for example by a lagrangian gluino Majorana mass term. (6 refs.)
- 59955 Non-collinear breaking of collinear symmetries at finite momentum transfer.** J.Pulido (Dept. of Math. Phys., Univ. of Birmingham, Birmingham, England). *Port. Phys. (Portugal)*, vol.13, no.3-4, p.123-36 (1982). The breaking of the $SU(2)_W$ collinear symmetry arising when leaving the forward direction in the scattering processes is studied. The starting point is the null-plane hydrogen atom Hamiltonian of Bell and Ruegg (1975) which exhibits this $SU(2)_W$ symmetry in an approximate form. Introducing an electromagnetic interaction with non-zero momentum transfer photons, it is found that breaking is mainly due to transversely polarized photons. Application to hadron-hadron scattering can only be realistic in the low q^2 exchange sector. (7 refs.)
- 59956 Apparent symmetry breaking and its restoration in path integral variational method.** J.Alfaro, B.Sakita (Phys. Dept., City Univ. of New York, New York, NY, USA). *Z. Phys. C (Germany)*, vol.17, no.2, p.171-3 (1983). If one uses a symmetry broken trial action in path integral variational calculations, one often obtains a set of apparently symmetry broken degenerate solutions. The authors present a variational method to determine whether the symmetry breaking is apparent or not. In order to elaborate the method they study the ground state energy of deep double well potential in detail. (6 refs.)

11.50 DISPERSION RELATIONS AND SUM RULES

- 59957 What can we learn from sum rules for vertex functions in QCD?** N.S.Craigie (Internat. Centre for Theoretical Phys., Trieste, Italy), J.Stern. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B216, no.1, p.209-43 (25 April 1983).
- The authors demonstrate that the light-cone sum rules for vertex functions based on the operator product expansion and QCD perturbation theory lead to interesting relationships between various non-perturbative parameters associated with hadronic bound states (e.g. vertex couplings and decay constants). They also show that such sum rules provide a valuable means of estimating the matrix elements of the higher spin operators in the meson wave function. (16 refs.)

12.00 SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS

12.10 UNIFIED FIELD THEORIES AND MODELS

- 59958 Are fractional charges and Dirac monopoles consistent with quantum mechanics?** A.E.Strominger. *Comments Nucl. & Part. Phys. (GB)*, vol.11, no.4, p.149-53 (1983).
- The author reviews the Dirac quantization condition and its extension to grand unified theories in the context of possible recent evidence for monopoles and for fractional charges. The existence of monopoles rules out several previous theoretical explanations of fractional charges and provides strong constraints on alternative explanations. (7 refs.)
- 59959 A minimal model of spontaneous CP violation with the gauge group $SU(2)_H \times SU(2)_R \times U(1)_{B-L}$** D.Chang (Carnegie-Mellon Univ., Pittsburgh, PA, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.3, p.435-51 (18 April 1983).
- The author proposes and analyzes a minimal model of spontaneous CP violation with the gauge symmetry $SU(2)_H \times SU(2)_R \times U(1)_{B-L}$. It is found that the 'isconjugate relation' of Mohapatra and Pati is no longer valid in this model even for the four-quark case. However, due to a dynamical effect all three of the main superweak predictions ($\eta_{+-} = \eta_{00}$, $\eta_{+-0} = \eta_{000}$ and $\eta_{+-0} = \eta_{+-}$) are approximately true to better than 1%. For the six-quark case, it is found that the Kobayashi-Maskawa phase is calculable and small so that its presence does not appreciably change the phenomenology of the model. (14 refs.)
- 59960 Intermediate mass scales and proton decay** Ling-fong Li, D.G.Unger (Dept. of Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.2, p.223-36 (11 April 1983).
- Simple sufficient conditions are obtained for ensuring baryon number conservation at intermediate mass scales between M_W and the grand unification mass in grand unified theories. These conditions are applied to obtain an $SO(14)$ model which can accommodate fractionally charged physical particles and which is consistent with the present experimental limits on the proton lifetime and $\sin^2 \theta_W(M_W)$. (11 refs.)
- 59961 Electromagnetic and weak interactions in stochastic space-time: a review** Kh.Namsrai, M.Dineykhani (Lab. of Theoretical Phys., JINR, Dubna, USSR). *Int. J. Theor. Phys. (USA)*, vol.22, no.2, p.131-92 (Feb. 1983).
- A scheme for a nonlocal theory of quantized fields based on the hypothesis of stochastic space is proposed. Within this scheme the gauge-invariant quantum electrodynamics of particles with spin 0, 1/2, 1 and four-fermion weak interactions are constructed, and nonlocal corrections to the anomalous magnetic moments of leptons and to the Lamb shift are calculated. Some consequences of the neutrino oscillations and the electromagnetic properties of neutrinos are considered in detail. Further the rare decay $K_L^0 \rightarrow \mu^+ \mu^-$ and the mass difference of K_1^0 and K_S^0 mesons are investigated in this model. It is shown that the parameter of nonlocality (elementary length l) of weak interactions which can characterize a domain of unification of weak and electromagnetic interactions is $\sim 10^{-16}$ cm. The low-energy experiments imply that quantum electrodynamics is valid up to distances of order $\sim 10^{-15}$ cm. (116 refs.)

tions is $\sim 10^{-16}$ cm. The low-energy experiments imply that quantum electrodynamics is valid up to distances of order $\sim 10^{-15}$ cm. (116 refs.)

- 59962 Is unification in physics necessary?** N.Dombey (Univ. of Sussex, Brighton, England). *New Sci. (GB)*, vol.97, no.1345, p.451-3 (17 Feb. 1983).
- The possible discovery of the so-called W subatomic particle is discussed. Physicists at CERN have found evidence consistent with the decay of a W particle. The existence of the W, if confirmed, is a crucial step in the verification of the unified theory of the electromagnetic force and the weak nuclear force. Alternative explanations of the experimental data, not involving the standard unified model, are examined. Sakurai and Hung's explanation of the experimental data on weak neutral currents by assuming quantum mixing between the electromagnetic current and the weak neutral current (1978) is discussed, along with Fermi's theory of beta decay (1933), in which neutral currents could exist without the mediation of W or Z particles, and the experiments at the DESY electron storage rings. The author concludes that, although weak and electromagnetic interactions need to be included in precise calculations of atomic properties, the role of W and Z particles is not yet established. (no refs.)
- 59963 Exact solution of the Dirac equation in the field of a 't Hooft-Polyakov monopole** W.J.Marciano, I.J.Muzinich (Dept. of Phys., Brookhaven Nat. Lab., Upton, NY, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.14, p.1035-7 (4 April 1983).
- This paper presents an exact solution of the Dirac equation for an $I=1/2$ fermion in the field of a 't Hooft-Polyakov magnetic monopole (in the Prasad-Sommerfield limit), which is analytic at $r=0$. Helicity conservation restricts the $J=0$ S-matrix to be pure charge exchange. Because of the long-range interaction, the scattering amplitude is enhanced at long wavelengths $\lambda \gg 1/M$ (the monopole structure size). The relevance of the present results for the question of proton decay catalysis is briefly discussed. (17 refs.)
- 59964 Complex rishon-type unification** A.Davidson, J.Sonnenschein (Dept. of Nuclear Phys., Weizmann Inst. of Sci., Rehovot, Israel). *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.299-302 (7 April 1983).
- Presents a flavor-chiral version of the rishon model. The troublesome $\alpha_C \rightarrow 0$ 't Hooft limit is satisfied in a non-exotic manner. The scheme is $SU(7)$ grand unified. Its uniqueness stems from the fact that a realistic $SU(n)_{HC}$ scenario is $SU(N)$ embeddable only provided $n=3, 4$ (or 5) preons involved. A total number of three quark/lepton families is dictated by the overall renormalizability. The electric charge serves as the fourth color. (13 refs.)
- 59965 Are n- \bar{n} oscillation and proton decay mutually exclusive?** C.C.Hazra, M.K.Parida, U.Sarkar (Post-Graduate Dept. of Phys., Sambalpur Univ., Sambalpur, India). *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.413-16 (14 April 1983).
- The effects of introducing the Higgs scalars mediating n- \bar{n} oscillation are examined using renormalisation group equations corresponding to a symmetry-breaking chain of $SO(10)$. In contrast to earlier results, it is found that both n- \bar{n} oscillation and proton decay are allowed along with a low-mass (~ 100 GeV) right-handed neutral gauge boson, but without observable parity restoration. (10 refs.)
- 59966 Radiative corrections to the Higgs potential of $SU(5)$** C.M.Fraser (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England), H.Huffel. *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.417-22 (14 April 1983).
- The first order radiative corrections to the Higgs potential of the minimal $SU(5)$ model arising from gauge boson loops are calculated. The authors present bounds on the Higgs couplings and masses, derived from the requirement that the $SU(5) \rightarrow SU(3) \times U(1)$ symmetry breaking pattern should persist at the one-loop level. (7 refs.)
- 59967 Monopolic atoms and monopole catalysis of proton decay** L.Bracci, G.Fiorentini (Istituto di Fisica, Pisa, Italy). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.29-33 (21 April 1983).
- The authors discuss the possibility that magnetic monopoles form electromagnetically bound systems (monopolic atoms) with atomic nuclei. By taking into account the Rubakov effect they find that a monopole passing through matter should catalyze a proton decay every few microns. Bounds on monopole fluxes and densities are derived. (14 refs.)
- 59968 Fermion mass ratios and low energy grand unification** M.Ozer (Internat. Centre for Theoretical Phys., Trieste, Italy). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.64-6 (21 April 1983).
- Within the framework of the 'naturalness' hypothesis for the Yukawa couplings, fermion mass ratios are shown to require the energy scale for grand unification and the energy scale for $SU(4)_{color}$ breaking to be greater than $10^9 \sim 10^{10}$ GeV. Hence very low energy unification and neutron-antineutron oscillations in grand unified theories are incompatible with the 'naturalness' of the Yukawa couplings and the masses of the Higgs scalars. (22 refs.)
- 59969 Flavor unification in $SU(8)$** K.S.Soh, P.Y.Pac (Dept. of Phys., Seoul Nat. Univ., Seoul, Korea), S.K.Kim. *Phys. Rev. D (USA)*, vol.27, no.7, p.1597-600 (1 April 1983).
- Flavor unification is proposed in the $SU(8)$ gauge group. This model imbeds the Georgi-Glashow $SU_{CG}(5)$ as a subgroup. It is necessary to modify Georgi's second postulate for grand unification so that the left-handed fermion representations are complex with respect to $SU(3) \times SU_W(2) \times U_Y(1) \times U(1)$. There are three families of light quarks, one right-handed isospin-singlet quark with charge $-1/3$, three ordinary lepton families, and one lepton doublet without a right-handed partner. (24 refs.)
- 59970 Higgs-boson effects in grand unified theories** R.N.Mohapatra (Dept. of Phys., City Coll., City Univ. of New York, New York, NY, USA), G.Senjanovic. *Phys. Rev. D (USA)*, vol.27, no.7, p.1601-12 (1 April 1983).
- It is argued that fine tuning of a minimal set of parameters, needed to fix the hierarchy of gauge-boson masses and a knowledge of intermediate symmetry groups, leads to 'natural' mass scales for physical Higgs bosons in grand unified theories. This is applied to $\Delta B=2$ transitions in models based on $SU(5)$, $SO(10)$, $SU(16)$, and $[SU(2M)]^4$. It turns out that the Higgs bosons which mediate $\Delta B=2$ neutron-antineutron and hydrogen-antihydrogen oscillations become superheavy, and so such transitions can be observable only in theories with low unification scales, such as $SU(16)$ and $[SU(8)]^4$, if one adheres to the hypothesis of minimal fine tuning. (26 refs.)
- 59971 Decoupling in theories with spontaneous symmetry breakdown. II. Application to the $SU(5)$ grand unified theory** D.G.C.McKeon, S.B.Phillips (Dept. of Appl. Math., Univ. of Western Ontario, London, Ontario, Canada). *Phys. Rev. D (USA)*, vol.27, no.7, p.1613-21 (1 April 1983).
- For pt.I see ibid., vol.26, no.8, p.2086 (1982). Following a method outlined previously, the Appelquist-Carazzone theorem is applied directly to the problem of breaking the $SU(5)$ grand unified theory down to the standard $SU(3) \times SU(2) \times U(1)$ theory. This is carried out within the context of the mass-independent renormalization scheme, which necessitates the calculation

of the anomalous-mass-dimension matrix of the intermediate vector bosons. A relation between the strong coupling constant and the Weinberg angle is determined. The mass of the leptoquark vector boson is estimated. (17 refs.)

59972 Fractionally charged lepton and low-mass magnetic monopole. D.K.Hong, J.Kim, J.E.Kim, K.S.Soh (Dept. of Phys., Seoul Nat. Univ., Seoul, Korea).

Phys. Rev. D (USA), vol.27, no.7, p.1651-3 (1 April 1983). The authors study an SO(14) model to predict a low-mass magnetic monopole and fractionally charged leptons. The mass of the magnetic monopole is $\approx 2 \times 10^9$ GeV. (17 refs.)

59973 Penguin diagram in supersymmetric theories. S.P.Chia, S.Nandi (Center for Particle Theory, Univ. of Texas, Austin, TX, USA).

Phys. Rev. D (USA), vol.27, no.7, p.1654-6 (1 April 1983). The authors have studied the penguin diagram in supersymmetric SU(3)_C × SU(2) × U(1) theories. It is found that the new penguin diagram introduced by supersymmetry has a structure similar to the usual penguin diagram. Its contribution, though comparable in the case of exact supersymmetry, is shown to be small when supersymmetry is broken. (9 refs.)

59974 Comment on neutral currents in a supersymmetric SU(2) × U(1) × U(1) model. Jin Min Kim, J.Kim, J.E.Kim (Dept. of Phys., Seoul Nat. Univ., Seoul, Korea).

Phys. Rev. D (USA), vol.27, no.7, p.1662-4 (1 April 1983). The authors studied the neutral-current aspects of Weinberg's supersymmetric SU(2) × U(1) × U(1) model. The scalar partner of the singlet superfield (\tilde{Y}_{X^c}) must develop a relatively large vacuum expectation value $\gtrsim 570$ GeV. (7 refs.)

59975 Upper limits to fermion masses in the Glashow-Weinberg-Salam model. R.A.Flores (Dept. of Phys., Univ. of California, Santa Cruz, CA, USA), M.Sher.

Phys. Rev. D (USA), vol.27, no.7, p.1679-82 (1 April 1983). Upper limits on the mass m_f of a fermion in the Glashow-Weinberg-Salam model were previously found by requiring that the vacuum be an absolute minimum of the one-loop Higgs potential for a Higgs-boson mass $m_H \leq 150$ GeV, it was found that $m_f \leq 100$ GeV. The authors note that including the effect of running couplings in the one-loop term enlarges the range of allowed masses based on this constraint. Requiring only that the Universe arrive in the vacuum and stay there for over 10^{10} yr further increases this bound to $m_f \leq 200$ GeV. (14 refs.)

59976 New ideas about neutrino masses. E.Witten (Joseph Henry Lab., Princeton Univ., Princeton, NJ, USA).

Phys. Teach. (USA), vol.21, no.2, p.78-87 (Feb. 1983). Discusses the question of the mass of the neutrino. Neutrino detection experiments and the phenomenon of parity violation in weak interactions are covered. Matter and antimatter concepts are postulated. Experimental prospects for the measurement of mass are given. (no refs.)

59977 An axial gauge formulation for QED₂. Y.Nakawaki (Dept. of Maths & Phys., Setsunan Univ., Osaka, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.235-51 (Jan. 1983). By choosing background electric field properly, the author remedies the surface-modified action formulation of Halpern and Senjanovic (1977) and of Pak (1978). It is found that if the proper background electric field satisfies an appropriate commutation relation, the Hamiltonian equation agrees with the Lagrange equation in a physical space defined by means of charge Q in $Q(\text{phys})=0$. An operator solution to massless spinor QED₂ is demonstrated to show that the author's formulation is consistent in every respect. Two ways to incorporate chiral transformations to the solution are also exhibited. (8 refs.)

59978 The electrodynamics with magnetic monopoles. I. Coulomb-gauge kinematics. K.Hirata (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.300-13 (Jan. 1983). As the first step of establishing a canonical theory of the electrodynamics with electric and magnetic point particles, the author gives kinematical discussions on the vector potential in the Coulomb gauge, which is shown to be compatible with the Lorentz invariance. The present formulation is a refined version of the fiber bundle formulation of Wu and Yang (1975). The author uses (i) the Dirac strings as subsidiary variables and (ii) a background vector potential to separate terms which depend kinematically on monopoles. The authors formulation is more tractable than the Wu-Yang original version. (17 refs.)

59979 Note on the magnitude of renormalization constants in quantum electrodynamics. S.Aramaki (Dept. of Phys., Nagoya Univ., Nagoya, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.323-8 (Jan. 1983). It is shown that Kallen's (1958) assertion which states that at least one of the renormalization constants in quantum electrodynamics is infinite cannot be

justified because the reasoning of his arguments destroys the covariance and the gauge invariance of the theory. (6 refs.)

59980 Poincare algebra of QED with Dirac's monopoles. K.Hirata (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.366-8 (Jan. 1983). The generators of the Poincare algebra are explicitly constructed, in terms of the canonical variables, for the classical and quantum electrodynamics with electric and magnetic point particles. (7 refs.)

12.35C General properties of quantum chromodynamics (dynamics, confinement, etc.)

59982 Wilson coefficients for parton decay at order α_s . Shen-Chang Chao, D.E.Soper.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.3, p.405-16 (18 April 1983). Calculates, at order α_s , certain Wilson coefficients that relate to the P_T spread of quark jets in QCD. Also included is a calculation of the quark decay function $d(z)$ in a spacelike axial gauge. (6 refs.)

59983 Towards a transport theory of the quark-gluon plasma: infrared divergences and scalar-meson theory. Sai-Ping Li, L.McLerran (Univ. of Washington, Seattle, WA, USA).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.3, p.417-34 (18 April 1983).

The authors consider the transport theory of an ultra-relativistic gas of particles. They study infrared divergences which may appear in a naive perturbation treatment in a massless scalar meson theory. They briefly discuss the potential applications of transport theory for ultra-relativistic nuclear collisions. (25 refs.)

59984 Dynamic chaos, Anderson localization, and confinement. S.M.Apenko, D.A.Kirzhnits, Yu.E.Loikov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.36, no.5, p.213-15 (5 Sept. 1982). Translation of: *Pisma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.5, p.172-4 (5 Sept. 1982). [received: April 1983]

A possible randomization of quantum chromodynamics can give rise to an effect similar to the localization which occurs in disordered macroscopic media. As a result, a discrete energy spectrum corresponding to a linearly increasing potential arises in a quark-antiquark system. (6 refs.)

59985 Large-N quantum chromodynamics at finite temperature. A.Gocksch (Dept. of Phys., New York Univ., New York, NY, USA), F.Neri.

Phys. Rev. Lett. (USA), vol.50, no.15, p.1099-101 (11 April 1983). It is pointed out that at $N \rightarrow \infty$, for finite temperature, the Schwinger-Dyson equations imply that below the deconfining phase transition the Wilson loops are independent of the temperature. This suggests a first-order deconfinement phase transition. (6 refs.)

59986 Role of the phonon in the quantum-chromodynamical plasma. P.Carruthers (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Rev. Lett. (USA), vol.50, no.16, p.1179-80 (18 April 1983). It is observed that a color-neutral scalar phonon mode of velocity $c/\sqrt{3}$ should exist in the QCD plasma. The energy density of the phonons is $3/3/16$ that of noninteracting massless gluons and compensates to a considerable extent for the suppression of gluon modes due to collective plasma effects. (11 refs.)

59987 Estimating gluon condensation. J.Chakrabarti (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).

Phys. Lett. B (Netherlands), vol.123B, no.5, p.339-44 (7 April 1983). The author makes an independent estimate of $\langle 0|G_\mu^a G_\mu^a|0\rangle$ and shows that its value may be higher than previously thought.

59988 Dynamical realization of the linear σ -model and bifermion condensates in QCD. V.P.Gusynin, V.A.Miransky, Yu.A.Sitenko (Inst. for Theoretical Phys., Kiev, USSR).

Phys. Lett. B (Netherlands), vol.123B, no.6, p.428-32 (14 April 1983). The dynamical realization of the linear σ -model in QCD is obtained in the framework of a recently suggested approach to gauge theories without fun-

damental scalars. It is also shown that the chiral condensate formation suppresses the formation of the colour condensates in the QCD vacuum. (15 refs.)

59989 The colourlessness partition function of the quantum quark-gluon gas. M.I.Gorenstein, S.I.Lipskikh, V.K.Petrov, G.M.Zinovjev (Acad. of Sci., Inst. for Theoretical Phys., Kiev, Ukrainian SSR). *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.437-40 (14 April 1983). The partition function of a quantum gas of quarks and gluons with an additional requirement of colourlessness for such systems is calculated. The effect of this constraint on the thermodynamical properties of the systems is considered. (9 refs.)

59990 Four quark states in additive potentials. J.L.Ballot, J.M.Richard (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France). *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.449-51 (14 April 1983). Considers the naive model where the quarks interact through two-body forces with colour octet exchange structure. With smooth quasi-logarithmic potentials, collective binding occurs in flavor exotic configurations. For instance $(cc\bar{s}\bar{s}) < 2(cc\bar{s})$. (12 refs.)

59991 Technicolor. R.K.Kaul (Centre for Theoretical Studies, Indian Inst. of Sci., Bangalore, India). *Rev. Mod. Phys. (USA)*, vol.55, no.2, p.449-75 (April 1983). The need for reexamination of the standard model of strong, weak, and electromagnetic interactions is discussed, especially with regard to 't Hooft's criterion of naturalness. It has been argued that theories with fundamental scalar fields tend to be unnatural at relatively low energies. There are two solutions to this problem: (i) a global supersymmetry, which ensures the absence of all the naturalness-violating effects associated with scalar fields, and (ii) composite structure of the scalar fields, which starts showing up at energy scales where unnatural effects would otherwise have appeared. With reference to the second solution, this article reviews the case for dynamical breaking of the gauge symmetry and the technicolor scheme for this article reviews the case for dynamical breaking of the gauge symmetry and the technicolor scheme for the composite Higgs boson. This new interaction, of the scaled-up quantum chromodynamic type, keeps the new set of fermions, the technifermions, together in the Higgs particles. It also provides masses for the electroweak gauge bosons W^\pm and Z^0 through technifermion condensate formation. In order to give masses to the ordinary fermions, a new interaction, the extended technicolor interaction, which would connect the ordinary fermions to the technifermions, is required. The extended technicolor group breaks down spontaneously to the technicolor group, possibly as a result of the 'tumbling' mechanism, which is discussed. In addition, the author presents schemes for the isospin breaking of mass matrices of ordinary quarks in the technicolor models. In generalized technicolor models with more than one doublet of technifermions or with more than one technicolor sector, one has additional low-lying degrees of freedom, the pseudo-Goldstone bosons. The pseudo-Goldstone bosons in the technicolor model of Dimopoulos are reviewed and their masses computed. In this context the vacuum alignment problem is also discussed. An effective Lagrangian is derived describing colorless low-lying degrees of freedom for models with two technicolor sectors in the combined limits of chiral symmetry and large number of colors and technicolors. Finally, the author discusses suppression of flavor-changing neutral currents in the extended technicolor models. (93 refs.)

59992 Cornerstones of QCD. M.R.Pennington (Dept. of Phys., Univ. of Durham, Durham, England). *Rep. Prog. Phys. (GB)*, vol.46, no.4, p.393-513 (April 1983). Quantum chromodynamics is the theory of the strong interactions. When these occur over very short distances, hadronic processes become calculable in a perturbative way. How this happens is reviewed with particular reference to the tests and clues experiments on e^+e^- annihilation and deep inelastic scattering provide, which show this is really so. (294 refs.)

59993 Loop calculations in confined QCD. I. J.Baacke, Y.Igarashi, G.Kasperidus (Inst. für Phys., Univ. of Dortmund, Dortmund, Germany). *Z. Phys. C (Germany)*, vol.17, no.2, p.161-9 (1983). Presents a method for calculating one loop corrections in QCD confined to a spherical cavity with bag boundary conditions. The authors use euclidean Green's functions separated into free space and boundary parts and use old-fashioned perturbation theory. As a first application they calculate that part of the quark selfenergy that gives rise to the confining mirror charge potential in the nonrelativistic approximation. They obtain a weaker potential for relativistic massive quarks. Some consequences are discussed. (16 refs.)

59994 Non-perturbative phenomena in QCD vacuum, hadrons, and quark-gluon plasma. E.V.Shuryak. Report CERN-83-01, CERN, Geneva, Switzerland (1 Feb. 1983), 21 pp. These lectures provide a brief review of recent progress in nonperturbative quantum chromodynamics (QCD). They are intended for non specialists, mainly experimentalists. The main object of discussion, the QCD vacuum, is a rather complicated medium. It may be studied either by infinitesimal probes producing microscopic excitations ($=$ hadrons), or by finite excitations (say, heating some volume to a given temperature T). In the latter case, some qualitative changes (phase transitions) should take place. A summary is given of the extent to which such phenomena can be observed in the laboratory by proton-proton, proton-nucleus, and nucleus-nucleus collisions. (51 refs.)

12.35E Applications of quantum chromodynamics to particle properties and reactions

59995 A measurement of charge properties of quark jets at PETRA. Ch.Berger, H.Genzel, R.Grignul, W.Lackas, F.Raupach, W.Wagner (Phys. Inst., RWTH Aachen, Aachen, Germany), A.Klovning, E.Lillestøl, J.M.Olsen, H.Ackermann, G.Alexander, G.Bella, J.Burger, L.Criegee, A.Eskreyes, G.Franke, Ch.Gerke, G.Knies, E.Lehmann, U.Michelsen, K.H.Pape, H.D.Reich, J.M.Scarr, B.Stella, U.Timm, G.G.Winter, S.T.Xue, W.Zimmermann, O.Achterberg, V.Blobel, L.Boesten, V.Hepp, H.Kapitzka, B.Koppitz, B.Lewendel, W.Luhrsen, R.Van Staa, H.Spitzer, C.Y.Chang, R.G.Glasser, R.G.Kellogg, K.H.Lau, R.O.Polyvado, B.Sechi-Zorn, J.A.Skard, A.Skuja, G.Welch, G.T.Zorn, A.Backer, F.Barreiro, S.Brandt, K.Derikum, C.Grupen, H.J.Meyer, B.Neumann, M.Rost, K.Stupperich, G.Zech, H.J.Daum, H.Meyer, O.Meyer, D.Schmidt. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.2, p.189-200 (11 April 1983).

The charge properties of quark jets produced in e^+e^- annihilation at 30 GeV c.m. energy have been investigated with the PLUTO detector. The authors find that the mean absolute value of the jet charge $\langle |Q_{jet}| \rangle = 0.55 \pm 0.25$ is small compared to the expectation from statistical models. Long-range charge correlations are observed. These results indicate that the sign of the primary quark charge can be obtained with high probability from the charge of the jet and its distribution in the jet. (7 refs.)

59996 A realistic model for e^+e^- annihilation including parton bremsstrahlung effects. T.D.Gottschalk (California Inst. of Technol., Pasadena, CA, USA).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.2, p.201-22 (11 April 1983).

The recently proposed model of Field and Wolfram (1983) for e^+e^- annihilation, which describes hadronization without using fragmentation functions, is examined and enlarged. Extensions of the original scheme include (i) heavy quark mass effects in the QCD parton shower and the explicit formation of final state heavy hadrons, (ii) a modification of the cluster formation algorithm to combine small mass clusters prior to hadronization and (iii) an enhanced rate of soft gluon production at early times in the parton shower. The last two modifications are fundamental and provide a more sensible separation of long and short distance physics. Initial results of the model agree well with PETRA/PEP data. Some predictions are made for LEP energies. (44 refs.)

59997 Pseudoscalar mesons and instantons. E.V.Shuryak (CERN, Geneva, Switzerland).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.2, p.237-52 (11 April 1983).

The author discusses the QCD sum rules for the correlators of pseudoscalar currents with quantum numbers of π , K , η , η' mesons. In the framework of the instanton model of the QCD vacuum suggested earlier, the author calculates SU(3) breaking effects such as K , η masses and η' mixing, as well as the U(1) breaking effect, the η' mass. The author concludes that all these phenomena are very well reproduced by this model. (22 refs.)

59998 CP violation, horizontal symmetry and the Kobayashi-Maskawa matrix. F.Hayot (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.2, p.253-60 (11 April 1983).

It is pointed out that in order to have CP violation in horizontal, generation mixing, interactions, while the Kobayashi-Maskawa matrix itself is real, a very specific structure is required for the unitary matrices that relate weak to mass eigenstates. Implications for the structure of quark mass matrices are also discussed. (8 refs.)

59999 Baryon masses and chiral symmetry breaking. D.Espriu, P.Pascual, R.Tarrach (Dept. Theoretical Phys., Univ. of Barcelona, Barcelona, Spain).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.2, p.285-98 (11 April 1983).

The authors study the $1/2^+$ baryon octet within the ITEP sum rule approach. With only the input of one mixing angle for the interpolating baryon operator, the quark vacuum condensates and the strange quark mass, the best values for the masses are obtained for $\langle \bar{s}s \rangle^{1/3} = 0.93(\mu\mu)^{1/3}$ and $m_s \approx 115$ MeV. They also give results for the $3/2^+$ decuplet. (11 refs.)

60000 Baryonium and possible supersymmetry between quarks and antiquarks. Gao Chong-shou (Dept. of Phys., Beijing Univ., Beijing, China), Ho Tso-hsiu.

Commun. Theor. Phys. (China), vol.1, no.6, p.761-7 (1982).

The possibility that diquark is a stable object in hadrons and there exists a global supersymmetry between quarks and antiquarks is discussed. Mesons, baryons and baryoniums can be classified unitedly in the adjoint representation of the supersymmetry group. The united mass splitting formula is obtained based on the supersymmetry and a naive physical mechanism for symmetry breaking. The mass spectra for baryonium ground states are obtained numerically and may be verified experimentally. Some significant characteristics of baryoniums are discussed and can be used as evident indications of the appearance of baryoniums. (2 refs.)

60001 A phenomenological transition potential $V_{q-\bar{q}q}$ derived from QCD theory. Zhang Zong-ye, Yu You-wen (Inst. of High Energy Phys., Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.1, no.6, p.783-6 (1982).

The procedure of the derivation of one gluon exchange quark-quark potential is extended from the case of on-shell to that of off-shell. A phenomenological transition potential between valence quark and sea quark $V_{q-\bar{q}q}$ is obtained. (3 refs.)

60002 Exponential dependence of the cross sections for deep-inelastic reactions on the quark's transverse momentum. B.L.Ioffe (Inst. of Theoretical & Experimental Phys., USSR).

JETP Lett. (USA), vol.36, no.5, p.198-201 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.5, p.160-2 (5 Sept. 1982). [received: April 1983]

It is shown on the basis of the sum rules of quantum chromodynamics that the cross sections for the production of a quark (or of hadron jets) with a transverse momentum k_\perp in deep-inelastic reactions depends exponentially on k_\perp^2 if k_\perp is not too large. (6 refs.)

60003 The mass and mixing of the pseudoscalar glueball. T.Teshima, S.Oneda (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).

Phys. Lett. B (Netherlands), vol.123B, no.6, p.455-9 (14 April 1983).

The pseudoscalar glueball mass and its mixing with the η' are studied in quantum chromodynamics, incorporating the chiral $U(3) \times U(3)$ algebra. The glueball mass is then estimated to be in the range 1.0-1.8 GeV. Identifying

the glueball with $\iota(1440)$, the η' - η and η' -glueball mixing angles are found to be $(10 \pm 2)^\circ$ and $(32 \pm 11)^\circ$, respectively. The two-photon decay of the glueball is also discussed. (14 refs.)

60004 Weak nuclear interactions in a hybrid baryon-quark model: p-p asymmetry. L.S.Kisslinger, G.A.Miller (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).

Phys. Rev. C (USA), vol.27, no.4, p.1602-10 (April 1983).

The hybrid multi-baryon-quark shell model of nuclei is developed for the study of weak interactions in nuclei. Application to the parity violating asymmetry in p - p elastic scattering is carried out. (25 refs.)

60005 Quark contributions to the $pp \rightarrow \pi^+ \pi^-$ reaction. G.A.Miller, L.S.Kisslinger (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).

Phys. Rev. C (USA), vol.27, no.4, p.1669-76 (April 1983).

A six-quark model is used to estimate short distance contributions to the $pp \rightarrow \pi^+ \pi^-$ amplitude. Substantial corrections to typical calculations are obtained. (24 refs.)

60006 The spectroscopy of light mesons. A.T.Filippov (Joint Inst. for Nuclear Res., Dubna, USSR).

Sov. Phys.-Usp. (USA), vol.25, no.6, p.371-91 (June 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.137, no.2, p.201-36 (June 1982). [received: April 1983]

A review is given of the most recent experimental data on light meson resonances together with a phenomenological analysis incorporating all the basic ideas of QCD. The following topics are discussed in greater detail: (1) the scalar meson problem; (2) the axial meson problem; (3) spin-spin and spin-orbit splitting in meson multiplets; (4) SU_3 and OZI (Okubo-Zweig-Iizuka) breaking in meson spectra and decays; (5) SU_3 breaking in Regge trajectories and in radial excitations; (6) quark mixing in isoscalar mesons (η - η' , ω - ϕ , f - f'); (7) experimental determinations of the η - η' mixing angle, and (8) radiative decays of vector and pseudoscalar mesons. (190 refs.)

12.35H Phenomenological composite models of particle structure and reactions (partons, bags, etc.)

60007 Short-distance structure of hadrons in supersymmetric QCD. C.Kounnas (CERN, Geneva, Switzerland), D.A.Ross.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.2, p.317-49 (11 April 1983).

Assuming supersymmetry to be a real symmetry in particle physics, the authors study the short-distance internal structure of nucleons (structure functions at large Q^2). They determine all calculable quantities in the leading logarithm approximation and discuss the $N=1$ supersymmetry relations between them. Further relations are obtained by observing that the $N=1$ supersymmetric Lagrangian becomes $N=2$ supersymmetric if the quarks and squarks are (formally) put into the adjoint representation of $SU(3)$ colour. From the calculated elements of the 4×4 matrix of the Q^2 evolution kernels and knowing the quark and gluon distributions at low Q^2 they are able to determine the quark, squark, gluon, and gluino distributions for Q^2 above the threshold for the production of supersymmetric particles. They find that in the asymptotic limit ($Q^2 \rightarrow \infty$) the quarks carry only $2/3$ of the nucleon's baryon number and the remaining $1/3$ is carried by the squarks. They also find that in this limit 0.32 of the longitudinal nucleon momentum is carried by gluons, 0.08 by gluinos, 0.36 by the quarks and 0.24 by the squarks. (18 refs.)

60008 Jets and the physics of new heavy quarks. J.B.Babcock, R.E.Cutkosky (Dept. of Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.1, p.40-82 (25 April 1983).

The authors have developed methods that can be used to isolate a clean sample of events with pair-produced heavy quarks in e^+e^- collisions. They show that most of the fundamental properties of a given heavy quark, as they would appear in pair production or in weak decays, can be deduced from a careful examination of this purified sample. (39 refs.)

60009 About the clusterization of partons in the hadron processes. Zhu Wei (Dept. of Phys., Normal Univ. of East China, Shanghai, China), Shen Jian-guo.

Commun. Theor. Phys. (China), vol.2, no.1, p.829-41 (1983).

The concepts of two kinds of clusterizations of partons is proposed. In terms of the model of quark recombination and perturbative QCD a set of distribution functions describing the clusterization are separated from the quark fragmentation function, and so some quantitative phenomenological information about the QCD soft processes is obtained. (5 refs.)

60010 Minimization principle for the unit of electric charge. G.Rosen (Dept. of Phys., Drexel Univ., Philadelphia, PA, USA).

Int. J. Theor. Phys. (USA), vol.22, no.2, p.207-8 (Feb. 1983).

The fine-structure constant is given theoretically as $\alpha = (137.03608)^{-1}$ if the eigenvalue of a charge-related operator is minimal for $\pm e/3$ quark states. (2 refs.)

60011 Role of hard and soft quark-nucleon collisions in the A dependence of the production of high- p_t hadrons in interactions with nuclei. S.A.Voloshin, Yu.P.Nikitin (Moscow Engng. Phys. Inst., Moscow, USSR).

JETP Lett. (USA), vol.36, no.5, p.201-4 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.5, p.163-5 (5 Sept. 1982). [received: April 1983]

A single hard collision and several soft collisions of a quark of the incident hadron with the nucleons of the nucleus play the major role in shaping the A dependence of the production of hadrons with large values of p_t . (6 refs.)

60012 Unitarity with quarks despite confinement: connection between deep inelastic scattering and deep inelastic annihilation processes in the scaling limit. J.L.Alonso, V.Azcoiti (Dept. de Fisica Teorica, Univ. de Zaragoza, Zaragoza, Spain).

Nuovo Cimento A (Italy), vol.74A, ser.2, no.1, p.9-16 (1 March 1983).

The authors prove that in a parton model which incorporates confinement there exists a subtle connection between analyticity of the virtual Compton amplitude and unitarity with quarks. Then they show that the experimental data on νW_2 for pions and νW_2 for nucleons indicate in this model an exactly zero free mass of at least one of the u or d quarks. This turns out, also, to be essential to understand the accepted behaviour of the pion electromagnetic form factor. (15 refs.)

60013 Relativistic quarkonium model based on instantaneous ladder BS equation. I. Basic equation and its properties. T.Murota (Faculty of Engng., Yamaguchi Univ., Kofu, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.181-210 (Jan. 1983).

Investigates a relativistic quarkonium model based on the instant ladder BS equation, i.e. the Salpeter equation. The interaction is assumed to be a sum of the linear potential and the gluon exchange propagator in the Coulomb gauge under instantaneous approximation. The author studies properties of the Salpeter equation and accumulate kinematical relations. These results will be used in a forthcoming paper in which the mass levels and other properties of the quarkonium predicted by this model will be reported. (11 refs.)

60014 Constituent quark parton model and soft hadronic processes. A.Kobayashi (Lab. of Phys., Niigata Univ., Niigata, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.351-3 (Jan. 1983).

Small P_T inclusive spectra are studied from a constituent quark parton model. The constituent quark (CQ) is regarded as made of a valence quark and a cloud of quark-antiquark pairs and gluons. The distribution functions of CQ are estimated using a similar version to the Kuti-Weisskopf model. (8 refs.)

60015 Quarkonium bound states and coupling to hadrons. S.Jacobs, K.J.Miller, M.G.Olsson (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).

Phys. Rev. Lett. (USA), vol.50, no.16, p.1181-3 (18 April 1983).

An inconsistency is found involving heavy quarkonia energy levels in the usual single-channel potential picture. Coupling to the nearest hadronic channel resolves the difficulty. (12 refs.)

60016 Production of heavy quarks: a nonperturbative approach. F.Halzen (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA), W.-Y.Keung, D.M.Scott.

Phys. Rev. D (USA), vol.27, no.7, p.1631-3 (1 April 1983).

The authors identify a way of producing heavy quarks overlooked by perturbative QCD. It successfully accommodates the data on photoproduction and hadroproduction of heavy quarks. Rates at higher energies are expected to be significantly in excess of those predicted by perturbative QCD. (5 refs.)

60017 Ground-state and P-wave charmed baryons in a consistent quark model with hyperfine interactions. C.S.Kalman, D.Pfeffer (Elementary Particle Phys. Group, Concordia Univ., Montreal, Quebec, Canada).

Phys. Rev. D (USA), vol.27, no.7, p.1648-50 (1 April 1983).

Masses of the various ground-state and negative-parity baryons containing one charmed quark are calculated using a parameter set developed for the non-charmed baryons. The sole additional parameter needed, m_c , is obtained by fitting to the observed mass of $\Lambda_c^{+}/2$. The resulting calculated value of the mass of $\Sigma_c^{+}/2$ is in reasonable agreement with experimental values. (9 refs.)

tions. Mechanisms through which exotic particles gain masses are discussed. It is found that exotic particles such as color octet leptons and color sextet quarks may gain masses ranging from 10^1 to 10^3 . Some phenomenological aspects of these exotic particles are discussed. (10 refs.)

60019 Anomalous weak charged currents of leptons and quarks in a substructure model. Huang Tao, Xie Yicheng (Inst. of High Energy Phys., Acad. Sinica, Beijing, China). *Commun. Theor. Phys. (China)*, vol.1, no.6, p.753-9 (1982).

The authors present a general approach to get the anomalous weak charged current of leptons and quarks in a substructure model, in which quarks, leptons and W-bosons are composed of preons (fermions and scalar bosons). They have shown that the $(V+A)$ current can be determined by the structure of leptons and quarks and the anomalous weak current can be very small. (6 refs.)

60020 Recombination model of subquark collision and scaling violation in superhigh energy collision. Gao Chong-shou (Dept. of Phys., Peking Univ., Beijing, China), Po Tso-hsiu.

Commun. Theor. Phys. (China), vol.2, no.1, p.843-55 (1983).

A recombination model of subquarks for superhigh energy collisions is proposed. The new phenomena observed in superhigh energy cosmic ray experiments can be explained naturally via the cascade decay of superfireballs of the subquark stratum from this model. The mean multiplicity, the average transverse momentum, the distributions of both transverse and longitudinal momenta and the inclusive spectrum for the superhigh energy collisions are obtained based on this model. It is shown that if the mean multiplicity of secondary particles increases as S increases according to the power law, a scaling violation should take place. When the behavior of mean multiplicity changes from $S^{1/4}$ to $S^{1/2}$ there will be a significant jump of violation coefficient and the scaling violation will become more significant as S increases. It is also pointed out that the characteristic behavior of the existence of the subquark stratum for the inclusive distribution is almost model-independent and can be treated as a decided experimental verification of the appearance of the subquark stratum, and in particular for accelerator experiments in the near future. (5 refs.)

60021 Generations of composite fermions. S.Kitakado (Toyota Technol. Inst., Nagoya, Japan). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.358-60 (Jan. 1983).

It is shown that the peculiar mass patterns of quarks and leptons might be explained by their possible composite structure. The generation number is related to the difference between the numbers are left- and right-handed constituents contained in the composite fermion. A simple model with three generations is constructed. (8 refs.)

60022 Quarks and leptons as quasi Nambu-Goldstone fermions. W.Buchmuller, R.D.Peccei, T.Yanagida (Max-Planck-Inst. fur Phys. und Astrophys., Munich, Germany).

Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.67-73 (21 April 1983).

The authors discuss a new idea for constructing composite quarks and leptons which have (approximately) vanishing mass. They are associated with fermionic partners of Goldstone bosons arising from the spontaneous breakdown of an internal symmetry G_f in a supersymmetric preon theory. For $G_f=SU(5)$ being broken to $SU(3)\times U(1)_{em}$ there arise as quasi Goldstone fermions, naturally and unequivocally, precisely the quarks and leptons of one family. The dynamics of these quasi Goldstone fermions is explored by constructing a general supersymmetric nonlinear effective Lagrangian. By means of a reduced model, it is shown that the first nontrivial interactions of the quasi Goldstone fermions can give rise, in an effective way, to the weak interactions. Issues connected with the incorporation of families in the scheme and the generation of masses, as well as the possible structure of the underlying preon theory are briefly discussed. (20 refs.)

60023 Analysis of preon models with a small number of flavors. II. T.G.Rizzo (Ames Lab., Iowa State Univ., Ames, IA, USA). *Phys. Rev. D (USA)*, vol.27, no.7, p.1622-30 (1 April 1983).

For pt.I see *ibid.*, vol.27, no.1, p.72 (1983). The author extends his analysis of four- and five-flavor preon models to six-flavor preon models; only a single color-triplet preon and three color-singlet preons are allowed by the trace constraints and the composite spectrum. Assuming that the precolor group is either $SU(N)$ or $SO(N)$ he finds three models of each kind which satisfy the anomaly- and asymptotic-freedom constraints along with possessing a reasonable composite spectrum. All these models may be grand unified at some large mass scale far above the precolor scale Δ_{PC} . (12 refs.)

60024 Composite quarks and leptons and horizontal symmetries. F.Bordi (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA), R.Casalbuoni, D.Dominici, R.Gatto.

Z. Phys. C (Germany), vol.17, no.2, p.179-82 (1983).

The authors describe models of composite quarks and leptons in which an explicit generation quantum number is carried by one of the preons. They find several possible solutions for the subcolor and the horizontal groups. (8 refs.)

60025 Energy densities, initial conditions and hydrodynamic equations for ultra-relativistic nucleus-nucleus collisions. K.Kajantie, L.Mclerran (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B214, no.2, p.261-84 (11 April 1983).

The authors discuss ultra-relativistic nucleus-nucleus collisions using an inside-outside cascade model. The considerations are valid only for $E_{cm}>20$ GeV/nucleon for collisions of nuclei of equal baryon number $A>1$. The time and space development of the cascade are described, and the maximum energy and quark number densities produced in such collisions are analytically estimated. Assuming thermalization immediately after materialization from the cascade, hydrodynamic equations, with source terms corresponding to the hadronic matter materialization, are determined. These equations are valid

globally in the beam and target fragmentation regions, and in the central region, and determine the energy density ϵ , baryon number density, n_B , and local flow velocity of the hadronic matter, u^μ , if an equation of state is given. (31 refs.)

60026 Unified fireball model for subquark stratum and possible experiments carried on colliding beam accelerators. Gao Chong-shou (Dept. of Phys., Peking Univ., China), Ho Tso-hsiu.

Commun. Theor. Phys. (China), vol.2, no.1, p.857-66 (1983).

A unified model based on the mechanisms of scattering and recombination for quarks and subquarks is proposed. The implications of this model for different energy regions are discussed. For the low energy regions, the predictions of this model are consistent with the well-known picture given experimentally. For the superhigh energy region it can be used to explain naturally almost all the new phenomena observed in cosmic ray experiments. The predictions of this model for experiments on the colliding beam accelerators are discussed in detail. These predictions can be verified and used as significant evidence of the existence of these mechanisms. (8 refs.)

60027 Theory of strings with boundaries: fluctuations, topology and quantum geometry. O.Alvarez (Newman Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.1, p.125-84 (25 April 1983).

The author discusses Polyakov's quantization of the string (1981) in the presence of a boundary allowing for an arbitrary topology for the world sheet. In addition to the dynamical conformal factor discovered by Polyakov, there are a finite number of new degrees of freedom if the surface is more complicated than a sphere or a disc. The quantization of the Liouville theory in an arbitrary topology is discussed. A one-loop calculation shows that the model is renormalizable if one performs a mass renormalization and an additive field renormalization. The renormalization group equations have a perturbative infrared unstable fixed point in all topologies. (28 refs.)

60028 Dynamic model of the real part of the scattering amplitude at zero angle. I.I.Levintov (Inst. of Theoretical & Experimental Phys., USSR).

JETP Lett. (USA), vol.36, no.5, p.204-8 (5 Sept. 1982). Translation of: Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR), vol.36, no.5, p.165-8 (5 Sept. 1982). [received: April 1983]

The real part of the elastic forward scattering amplitude is examined on the basis of the diffraction dissociation model. In this picture, the positive sign of the real part observed at high energies indicates that $\text{Re } f(0)$ is an entirely peripheral effect, a halo. This conclusion agrees with the available experimental data. (12 refs.)

How large is $\sigma(\psi N)$? See Entry 60055

12.70 HADRON MASS FORMULAS

60029 Fit of charmonium and Upsilon spectra by a common potential $V_0+A\log(1+r)$. S.N.Jena (Dept. of Phys., Aska Sci. College, Aska, India).

Phys. Lett. B (Netherlands), vol.123B, no.6, p.445-8 (14 April 1983).

Shows that both charmonium and Upsilon spectra can be simultaneously fitted by a potential of the form $V(r)=-1.71+1.067\log(1+r)$. It is found that the spin-averaged masses, fine-hyperfine splittings and leptonic decay width ratios of these spectra can be well understood without taking into account the short distance part of the potential as suggested by QCD. The author makes several predictions for the bb spectra which could hopefully be tested in the near future. (10 refs.)

12.90 MISCELLANEOUS THEORETICAL IDEAS AND MODELS

60030 Particle-antiparticle annihilation in diffusive motion. D.Toussaint, F.Wilczek (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).

J. Chem. Phys. (USA), vol.78, no.5, p.2642-7 (1 March 1983).

The authors study both numerically and analytically the time development of a system of particles and antiparticles moving diffusively and annihilating irreversibly. The asymptotic behavior is found to depend dramatically on

whether the initial fluctuations are localized or entirely random. Physical examples of each kind are identified. (12 refs.)

13.00 SPECIFIC REACTIONS AND PHENOMENOLOGY

13.10 WEAK AND ELECTROMAGNETIC INTERACTIONS OF LEPTONS

60031 A search for new heavy leptons at PETRA. W.Bartel, D.Cords, G.Dietrich, R.Eichler, R.Felst, D.Haidt, H.Krehbiel, K.Meier, B.Naroska, L.H.O'Neill, J.Olsson, U.Schneekloth, P.Steffen (DESY, Hamburg, Germany), E.Elsen, G.Heinzelmann, H.Kado, A.Petersen, P.Warming, G.Weber, S.Bethke, J.Heintze, K.H.Hellenbrand, R.D.Heuer, J.von Krogh, P.Lennert, S.Kawabata, S.Komamiya, H.Matsumura, T.Nozaiki, H.Rieseberg, A.Wagner, A.Bell, F.Foster, G.Hughes, H.Wriedt, J.Allison, A.H.Ball, G.Bamford, R.Barlow, C.Bowdery, I.P.Duerdodt, I.Glendinning, F.K.Loebinger, A.A.Macbeth, H.McCann, H.E.Mills, P.G.Murphy, P.Rowe, K.Stephens, D.Clarke, M.C.Goddard, R.Marshall, G.F.Pearce, J.Kanzaki, T.Kobayashi, M.Koshiba, M.Minowa, M.Nozaiki, S.Odaka, S.Orito, A.Sato, H.Takeda, Y.Totsuka, Y.Watanabe, S.Yamada, C.Yanagisawa. *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.553-60 (7 April 1983). Results are presented on a search for new heavy leptons, a sequential heavy lepton L^\pm , and an electro-type neutral heavy lepton E^0 , using the JADE detector at PETRA. No evidence for either of these particles was observed. A lower mass limit for the L^\pm is determined to be 18.0 GeV/c² at 95% CL. Lower mass limits for the E^0 are 24.5 GeV/c² and 22.5 GeV/c² in the case of universal V+A and V-A coupling at the W-e-E vertex, respectively. (15 refs.)

60032 Production of single W bosons in e^+e^- and e^-p collisions. H.Neufeld (Inst. für Theoretische Phys., Univ. Wien, Wien, Austria). *Z. Phys. C (Germany)*, vol.17, no.2, p.145-51 (1983). The production of W bosons in electron-positron colliding beams below the W⁺W⁻ threshold is discussed. The corresponding reactions $e^+e^- \rightarrow l^\pm W^\mp (\nu_l)$ yield total cross-sections of the order of 10^{-37} cm² (for $l=e$) and 10^{-38} cm² (for $l=\mu$). The total cross-sections as well as the angular and energy distributions of the W boson in $e^+e^- \rightarrow e^\pm W^\mp (\nu_e)$ are sensitive to the magnetic moment of the W. So, with this reaction, not only W bosons can be produced but also the gauge nature of the interaction can be tested. The decay $Z^0 \rightarrow l^\pm W^\mp (\nu_l)$ is discussed in view of its observation in e^+e^- experiments. Finally the cross-sections of $e^-p \rightarrow \nu_e W^- X^+$ are computed. They are of the order of 10^{-38} cm² for $\sqrt{s} \approx 200$ GeV. (16 refs.)

13.15 NEUTRINO INTERACTIONS

(inc. interactions involving cosmic rays)

60033 An investigation of quark and diquark fragmentation in νp and $\bar{\nu} p$ charged current interactions in BEBC. P.Allen, H.Grassler, D.Lanske, R.Schulte (III. Phys. Inst., Tech. Hochschule, Aachen, Germany), K.Bockmann, C.Geich-Gimbel, B.Nellen, H.Saarikko, A.Grant, H.Klein, D.R.O.Morrison, P.Schmid, H.Wachsmuth, G.Corrigan, G.Miyatt, D.Radojicic, B.Saitta, J.Wells, M.Aderholz, T.Coghen, N.Schmitz, K.L.Wernhard, W.Witteck. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.3, p.369-91 (18 April 1983). Distributions of the Feynman x variable have been determined for positive and negative pions in charged current neutrino-proton and antineutrino-proton reactions with hadronic energy $W > 3$ GeV and Bjorken $x_B < 0.1$. The distributions have been corrected for experimental effects such as measurement errors, uncertainties in estimating and neutrino energy and particle misidentification. In the framework of the quark-parton model, the distributions yield information about the fragmentation of forward going u and d quarks and backward going u and d quarks. Approximate Feynman scaling is observed for the invariant Feynman x_F distributions. They can be fitted by a power law of the form $(1 - |x_F|)^n$ as suggested by the dimensional counting rules. Simple isospin relations predicted by the quark-parton model are fulfilled. The fragmentation of diquarks is compared with that of protons into π^\pm . (21 refs.)

60034 How the first neutral-current experiments ended. P.Galison (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA). *Rev. Mod. Phys. (USA)*, vol.55, no.2, p.477-509 (April 1983). At the beginning of the 1970s there seemed little reason to believe that strangeness-conserving neutral currents existed: theoreticians had no pressing need for them and several experiments suggested that they were suppressed if they were present at all. Indeed the two remarkable neutrino experiments that eventually led to their discovery were designed and built for very different purposes, including the search for the vector boson and the investigation of the parton model. In retrospect one knows that certain gauge theories (notably the Weinberg-Salam model) predicted that neutral currents exist. But until 't Hooft and Veltman proved that such theories were renormalizable, little effort was made to test the new theories. After the proof the two experimental groups began to reorient their goals to settle an increasingly central issue of physics. Do neutral currents exist? The author asks here: What kind of evidence and arguments persuaded the participants that they had before them a real effect and not an artifact of the apparatus? What eventually convinced them that their experiment was over? An answer to these questions requires an examination of the organization of the experiments, the nature of the apparatus, and the previous work of the experimentalists. Finally, some general observations are made about the recent evolution of experimental physics. (99 refs.)

60035 Deep-inelastic neutrino-production of charmed particles. I.Stoletnii. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.321-6 (March 1983). In Russian. The $\nu N \rightarrow \mu\bar{\nu} X$ and $\bar{\nu} N \rightarrow \mu N \rightarrow \mu DDX$ processes are considered. Differential cross-sections of these reactions are calculated in the second order in QCD. Cross-sections of reactions due to antineutrinos are found to exceed those of analogous reactions due to neutrino under the same kinematic conditions. The results obtained also describe the $\nu N \rightarrow \mu\bar{\nu} X$ reaction which can proceed by an analogous mechanism. (15 refs.)

13.40 ELECTROMAGNETIC PROCESSES AND PROPERTIES

60039 Electromagnetic radii and quark structure of the nucleon. G.F.Wolters (Nat. Inst. for Nuclear & High Energy Phys., Amsterdam, Netherlands). *Z. Phys. C (Germany)*, vol.17, no.2, p.129-34 (1983). Electromagnetic radii and the empirical dipole radius of the nucleon are considered in conjunction with probability densities of constituent quarks. Using as input the neutron charge radius and the dipole radius, constraints on the remaining radii lead to deviations of about 15% from values taken from literature. Some modifications of current values are proposed especially concerning proton radii. Implications of radial quark structure of the nucleon are indicated. (23 refs.)

13.40F Electromagnetic form factors; electric and magnetic moments

60040 Magnetic moments of baryons and quarks. L.G.Pondrom (Univ. of Wisconsin, Madison, WI, USA). *AIP Conf. Proc. (USA)*, no.95, p.45-57 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). New measurements of $\mu(\Sigma^+)$ and $\mu(\Sigma^-)$ reported to this conference are combined in the previous data to give the current status of the baryon magnetic moments. (21 refs.)
60041 Magnetic moments of charged hyperons. R.Handler, R.Grobel, B.Lundberg, L.Pondrom, M.Sheaff, C.Wilkinson (Univ. of Wisconsin, Madison, WI, USA), A.Beretvas, L.Deck, T.Devlin, B.Luk, R.Rameika, P.T.Cox, C.Dukes, J.Dworkin, O.Oversteth, K.Heller. *AIP Conf. Proc. (USA)*, no.95, p.58-63 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). Measurements of the magnetic moments of the Ξ^+ , Σ^+ and Σ^- baryons are presented. The values found are $\mu(\Xi^+) = -69 \pm 04$, $\mu(\Sigma^+) = 2.31 \pm 027$ and $\mu(\Sigma^-) = -89 \pm 14$ in units μ_N . The Ξ^- and Σ^- results are final, while the Σ^+ value is based on a preliminary analysis of about 22% of the data sample. (2 refs.)
60042 Magnetic moments of the Σ^+ and Σ^- . J.P.Marriner (Fermilab, Batavia, IL, USA), E.W.Anderson, C.Ansenbrandt, J.P.Berge, A.Breakstone, A.E.Brenner, J.Butler, T.Cardello, P.S.Cooper, K.Doroba, J.Elias, J.Lach, P.Laurikainen, J.MacLachlan, E.McCliment, L.J.Teig, J.Thron, Y.W.Wah. *AIP Conf. Proc. (USA)*, no.95, p.64-71 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). Reports preliminary results from Fermilab experiment E-497 on the magnetic moments of the Σ^+ and Σ^- . The experiment was designed to measure the fluxes and polarizations of the hyperons. It is possible to measure the magnetic moment by measuring the spin precession of a polarized hyperon beam. (6 refs.)
60043 The Σ^- moment experiment at BNL. B.L.Roberts, G.W.Dodson, J.P.Miller, F.O'Brien, D.Tieger (Boston Univ., Boston, MA, USA), R.J.Pow-ers, N.Colella, R.B.Sutton, M.Eckhause, K.Giovanetti, D.W.Hetzog, J.R.Kane, W.Phillips, W.F.Vulcan, R.E.Welsh, R.Wheyley, R.G.Winter, A.R.Kunselman. *AIP Conf. Proc. (USA)*, no.95, p.72-6 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). A new measurement of the Σ^- magnetic dipole moment has been performed at the Brookhaven AGS using the exotic atom technique. K^- from the C4 line were stopped in a laminar target which consisted of sheets of Pb or W

immersed in a LH_2 bath. Monoenergetic π^+ from the reaction, $K^- + p \rightarrow \Sigma^- + \pi^+$ tagged Σ^- production. The fine-structure splitting in the Σ^- hyperonic X-rays was measured and the authors report here a preliminary value obtained from the $\Sigma^- (N=11, n=10)$ X-ray in $\Sigma^- \text{-Pb}$. The value obtained is: $\mu(\Sigma^-) = -1.097 \mu_N$ with a statistical error of $\pm 0.04 \mu_N$ and an estimated systematic error of $\pm 0.04 \mu_N$. (5 refs.)

60044 Status of G-2 calculation for the electron and muon. T.Kinoshita (Newman Lab., Cornell Univ., Ithaca, NY, USA). *AIP Conf. Proc. (USA)*, no.95, p.281-8 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). The electron anomalous magnetic moment provides the most precise test of QED. The present precision is such that one must begin to seriously question the validity of theories of condensed-matter physics underlying the determination of α . The muon anomalous magnetic moment will play a very important role in testing gauge theories of electroweak interactions at the one loop level. Electron and muon moments may also provide useful information on the possible internal structure of leptons. Experimental and theoretical works are under way to improve the precision of these tests. Here the author reports on the present status of theoretical progress. (24 refs.)

60045 Quark models of baryon resonances. G.Karl (Guelph Waterloo Graduate Program in Phys., Univ. of Guelph, Guelph, Ontario, Canada). *AIP Conf. Proc. (USA)*, no.95, p.310-15 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). After a short introduction the author comments on baryon magnetic moments, on the Ω^- electric quadrupole moment, on coupling constants for weak semileptonic decays and on the question of constituent gluons in baryons. (6 refs.)

60046 Sum rule analysis of hyperon magnetic moments. J.Franklin (Temple Univ., Philadelphia, PA, USA). *AIP Conf. Proc. (USA)*, no.95, p.323-5 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). Sum rules for baryon magnetic moments are tested using accurate new hyperon magnetic moment measurements reported at this conference. The difference ($\Sigma^0 \Sigma^-$) of Σ hyperon moments is inconsistent with the sum rules indicating large $\text{SU}(3)$ breaking non-static contributions to baryon magnetic moments. The new measurement for the Σ^- moment would imply an anomalously small strange quark contribution to the Σ magnetic moment. (11 refs.)

60047 Electromagnetic form factors and quark structure of the nucleon. G.F.Wolters (Nat. Inst. voor Kernfysica en Hoge Energifysica, Amsterdam, Netherlands). *AIP Conf. Proc. (USA)*, no.95, p.326-8 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). Electromagnetic nucleon form factors are studied as weighted combinations of constituent quark densities in Q-space. Experimentally established deviations from the empirical dipole fit for G_E , G_M , $G_{E,2}$ and the behaviour of $G_{E,2}$ are shown to agree with the sum rule involved. An explanation is offered of the effect in spin-spin asymmetry in hard pp scattering. (6 refs.)

60048 A new method for calculating a quark model with unequal mass and higher angular momentum. Ming Zhong Wang (Chengdu Univ. of Sci. & Technol., Sichuan, China). *AIP Conf. Proc. (USA)*, no.95, p.359-61 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). A new calculation method, called the complete rotation method, is proposed to research quark models. With this method, the mesonic scalar-scalar and spinor-spinor quark models are generalized to the case where the mass of quark is not equal to that of the anti-quark. In order to maintain the covariance of Bethe-Salpeter equation, the author has posed a four dimensional covariant potential for the physical requirement. With the aid of DJS-6 computer. The author has solved the system of integral equations. Using these wave functions, the quantitative results are in agreement with experiment, not only for the radius of the pion but also for the spacelike electromagnetic form factor of the pion. Other physical quantities are also calculated. The kernel functions of higher angular momentum are partly given. (10 refs.)

13.60F Elastic and Compton scattering

60051 Comment on the problem of the off-shell γNN vertex function in ed elastic scattering. D.Kusno (Dept. of Phys., Univ. of Indonesia, Jakarta, Indonesia). *Phys. Rev. D (USA)*, vol.27, no.7, p.1657-9 (1 April 1983).

It is shown that there is an ambiguity in the form of the off-shell γNN vertex function in ed elastic scattering. The degree of the ambiguity problem might be reduced by the requirement that the vertex be free of kinematic singularities and the off-shell isoscalar nucleon form factors be analytic. (12 refs.)

60052 Off-shell γNN vertex function in ed elastic scattering. F.L.Ridener, Jr., H.S.Song, R.H.Good, Jr. (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA). *Phys. Rev. D (USA)*, vol.27, no.7, p.1660-1 (1 April 1983).

Some of the arguments about the form of the off-shell γNN vertex function are reviewed, in response to a comment of Kusno's (1983). It is shown that there is no more ambiguity in the γNN vertex function than provided for in the original paper. (2 refs.)

13.60H Total and inclusive cross sections

(inc. deep-inelastic processes)

60053 Quark model calculations of nucleon structure functions. L.S.Celenza, C.M.Shakin (Dept. of Phys., City Univ. of New York, Brooklyn, NY, USA). *Phys. Rev. C (USA)*, vol.27, no.4, p.1561-71 (April 1983).

The authors present calculations of those structure functions of the nucleon which are measured in deep inelastic electron scattering. A quark model which preserves translational invariance is used. The model exhibits scaling and the structure functions satisfy the Callan-Gross relation in the scaling region. It is possible to fit the experimental values of $F_2^p(x) - F_2^n(x)$ using wave functions that correspond to a relatively small region of confinement. The ratio of $F_2^n(x)/F_2^p(x)$ is also calculated. One can explain the deviation of the value of the latter quantity from the value $2/3$ obtained in the simplest quark model by allowing the neutron confinement radius to be about 10 percent larger than the corresponding proton radius. They also discuss the role of this radius modification in explaining the deviation of the ratio of the proton and neutron magnetic moments from the value of $-3/2$ obtained in standard quark models. (11 refs.)

13.60K Meson production

60054 Backward electroproduction of π^+ mesons in the second and third nucleon resonance region. H.Breuer, V.Burkert, U.Hartfiel, Knop, G., J.Langen, M.Leeen, W.Mehner, R.Sauerwein, D.Schablitzky, G.Schnicke (Phys. Inst., Univ. Bonn, Bonn, Germany), J.Drees, S.Kiontke, K.Koseck, G.Lenzen, M.Renkhoof. *Z. Phys. C (Germany)*, vol.17, no.2, p.121-7 (1983).

The reaction $ep \rightarrow e\pi^+ n$ has been studied in the invariant mass range of $1.44 \leq W \leq 1.83$ GeV. The outgoing pion was detected in the backward direction ($\cos \theta^* \leq -0.94$) with respect to the virtual photon at four-momentum transfers of $0.4 \leq q^2 \leq 0.7$ (GeV/c^2). The values of the helicity-1/2-partial wave amplitudes $A_2(-D_{13}(1520))$ and $A_3(-F_{15}(1688))$ were determined by a phenomenological analysis and compared with single quark transition models. (19 refs.)

13.60M Meson-resonance production

60055 How large is $\sigma(\psi N)$? F.D.Gault, A.B.Rimmer (Phys. Dept., Univ. of Durham, Durham, England). *Nuovo Cimento A (Italy)*, vol.74A, ser.2, no.1, p.1-8 (1 March 1983).

The total cross-section $\sigma(\psi N)$ is deduced, by using the vector-dominance model, from recent data on $d\sigma/dt$ at $t=0$ for the process $\gamma N \rightarrow \psi N$ with photon energies above 40 GeV. This result is compared with a $\sigma(\psi N)$ determination which is independent of the vector-dominance model. The q^2 -dependence of the vector-meson-photon coupling is examined in an analysis of recent data on the decay widths $\psi \rightarrow \gamma \gamma$ and $\psi \rightarrow \psi \gamma$ and the resulting suppression factor is applied to the vector-dominance model prediction of $\sigma(\psi N)$. The lowest value deduced is $\sigma(\psi N) = 7$ mb. (32 refs.)

13.65 HADRON PRODUCTION BY ELECTRON-POSITRON COLLISIONS

60056 The order α_s^2 energy-energy correlation function at small angles. Shen-Chang Chao, D.E.Soper (Inst. of Theoretical Sci., Univ. of Oregon, Eugene, OR, USA), J.C.Collins. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B214, no.3, p.513-18 (18 April 1983).

The coefficients that give the small angle (back-to-back) behavior of the energy-energy correlation function in e^+e^- annihilation are calculated at order α_s^2 from previous all order, small angle formulas. The purpose is to facilitate comparison with all angle, order α_s^2 calculations. (11 refs.)

60057 Glueball production in high energy e^+e^- collision. E.-I.Kawai (Dept. of Phys., Ehime Univ., Matsuyama, Japan). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.211-20 (Jan. 1983). Inclusive glueball production via two-photon subprocess in high energy e^+e^- collision is discussed. Formulae for the cross section are shown and then numerically evaluated. It is demonstrated that considerably large cross section is expected with feasible rate for future experiments. (16 refs.)

60058 Single logarithm effects in electron-positron annihilation. J.Kodaira, L.Trentadue (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA). *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.335-8 (7 April 1983). Shows that the inclusion of the single logarithmic terms in the perturbative treatment of the energy-energy correlation at large collinearity angles makes the introduction of nonperturbative hadronisation effects crucial to describe the experimental data at the present energies. It is unlikely that further perturbative corrections will change this result. (14 refs.)

60059 Experimental evidence for differences in $\langle p_T \rangle$ between quark jets and gluon jets. W.Bartel, D.Cords, G.Dietrich, P.Dittmann, R.Eichler, R.Felst, D.Haidt, H.Krehbiel, K.Meier, B.Naroska, L.H.O'Neill, J.Olsson, P.Steffen (Deutsches Elektronen-Synchrotron DESY, Hamburg, Germany), E.Elsen, G.Heinzelmann, H.Kado, A.Petersen, P.Warming, G.Weber, S.Bethke, J.Heintze, K.H.Hellenbrand, R.D.Heuer, S.Kawabata, S.Komamiya, J.von Krogh, P.Lennert, H.Matsumura, T.Nozaki, H.Rieseberg, A.Wagner, A.Bell, F.Foster, G.Hughes, H.Wriedt, J.Allison, A.H.Ball, G.Bamford, R.Barlow, C.Bowdery, I.P.Duerdoth, I.Glendinning, F.K.Loebinger, A.A.Macbeth, H.McCann, H.E.Mills, P.G.Murphy, P.Rowe, K.Stephens, D.Clarke, M.C.Goddard, R.Marshall, G.F.Pearce, J.Kanzaki, T.Kobayashi, M.Koshiba, M.Minowa, M.Nozaki, S.Odaka, S.Orito, A.Sato, H.Takeda, Y.Yotsuka, Y.Watanabe, S.Yamada, C.Yanagisawa. *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.460-6 (14 April 1983). The authors have studied the transverse momentum p_T of particles within jets as a function of jet energy using planar 3-jet final states produced in the reaction $e^+e^- \rightarrow$ hadrons at CM energies of 22 GeV and 29-36.4 GeV. At a given jet energy, the mean value $\langle p_T \rangle$ of the lowest energy jet is found to be larger than that of the other jets. First order QCD simulations indicate that the lowest energy jet has the largest probability of representing the debris of the gluon. (11 refs.)

60060 Three-jets production in broken color gauge symmetry. J.D.Anand, S.N.Biswas, A.Goyal, J.N.Passi (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India). *Phys. Rev. D (USA)*, vol.27, no.7, p.1636-9 (1 April 1983). The authors calculate the cross section for three-jets production in e^+e^- annihilation for arbitrarily polarized beams in the context of the broken color gauge symmetry originally due to Pati and Salam. For values of the gluon mass $m_g^2/q^2 < 10^{-2}$ (q^2 is the square of the center-of-mass energy) they find marked departure of the thrust-axis angular-dependence coefficient from the QCD prediction. (6 refs.)

60061 Fire-string decay in high-energy e^-e^+ annihilation: one-particle distributions and scaling violations. L.Angelini, L.Nitti, M.Pellicoro, G.Preparata (Istituto di Fisica, Univ. di Bari, Bari, Italy), G.Valenti. *Phys. Rev. D (USA)*, vol.27, no.7, p.1668-71 (1 April 1983). The fire-string approach is applied to study the structure of one-particle inclusive distributions and their energy dependence in high-energy e^-e^+ annihilations. Differently from QCD the authors predict sizable scaling violations, which are found to be in good agreement with recent experimental data. (10 refs.)

60062 $J/\psi + \eta'$ production in e^+e^- -annihilation: a perturbative QCD calculation. J.H.Kuhn (Inst. fur Theoretische Phys., E. Technische Hochschule, Aachen, Germany), K.H.Streng. *Z. Phys. C (Germany)*, vol.17, no.2, p.175-8 (1983). The cross section for the reaction $e^+e^- \rightarrow S_1^+ + S_0^-$ is calculated in the framework of perturbative QCD, using the nonrelativistic approximation for the S_1^+ and S_0^- bound states. The model is applied to J/ψ plus η , η' , and ι production. The authors find extremely small rates in contrast to previous estimates based on vector meson dominance and discuss possible reasons for this difference. (6 refs.)

60064 Rigorous bounds on $\pi\pi$ amplitudes in terms of the D-wave scattering lengths. A.D.Gangal (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany). *Nuovo Cimento A (Italy)*, vol.74A, ser.2, no.1, p.117-27 (1 March 1983). Rigorous bounds on physical-region averages of real parts of $\pi\pi$ amplitudes are obtained in terms of the D-wave scattering lengths. These bounds provide consistency checks on $\pi\pi$ scattering data, the experimental information on which is not in a satisfactory state. An example of the bounds is (in units with $\hbar=c=m_\pi=1$ and $s=(\text{c.m. energy})^2$)
 $-0.013 \leq g = (3/32) \int_0^s ds (s+4)(8-s) \{ -2(g-4)\text{Re}F^{(0)}(s,0) + 3(3s-4)\text{Re}F^{(1)}(s,0) + 5(s-4)\text{Re}F^{(2)}(s,0) \} \leq 0.019$, where $F^{(l)}(s,t)$ is isospin- l $\pi\pi$ amplitudes. From the CERN-Munich experiment, the value of g would be in the range 0.018 ± 0.008 to 0.029 ± 0.007 depending upon the value of the $I=2$, S-wave scattering length. (15 refs.)

60065 Effective range expansion for the pion-pion system. S.K.Adhikari, J.R.A.Torreao (Dept. de Fisica, Univ. Federal de Pernambuco, Recife, PE, Brazil). *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.452-4 (14 April 1983). For small value of the scattering length a ($|a| \sim 0$) the effective range function $k \cot \delta$ has a pole for small k^2 . In such a case it is advantageous to study an expression of the function $k^{-1} \tan \delta$ which is expected to yield a linear dependence on k^2 for small k^2 . An expansion for the function $k^{-1} \tan \delta$ is derived and is applied to the pion-pion system to extract the S-wave scattering lengths and effective ranges satisfactorily from phase shifts where the usual effective range expansion fails because of the occurrence of subthreshold poles in $k \cot \delta$. (11 refs.)

13.85D Elastic scattering (energy > 10 GeV)

60066 An experimental study of large-angle elastic scattering of charged mesons and antiprotons on protons at 20 and 30 GeV/c incident momenta. C.Baglin (LAPP, Annecy, France), R.B.Bock, K.Brobakken, L.Bugge, T.Buran, A.Buzzo, P.J.Carson, V.Causton, M.Coupland, D.G.Davis, B.G.Duff, S.Ferroni, I.Kenyon-Gjerpe, V.Gracco, J.P.Guillaud, J.Haldorsen, J.D.Hansen, P.Helgaker, F.F.Heyman, D.C.Imrie, E.K.Johansson, K.Kirsebom, S.Kooijman, R.Lowndes, A.Lundby, G.J.Lush, M.Macri, R.Mollerud, J.Myrheim, M.Poulet, J.Tavernier, L.Rossi, A.Santroni, B.Schistad, G.Skjelving, S.O.Sorensen, M.Yvert. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B216, no.1, p.1-39 (25 April 1983). A description is given of an experiment to study elastic scattering of π^\pm , K^\pm and \bar{p} on protons at CM scattering angles from 45° to 100° at incident laboratory momenta 20 GeV/c and 30 GeV/c. The corresponding t range is from $-6.2 (\text{GeV}/c)^2$ to $-28 (\text{GeV}/c)^2$. There are no previous observations for these reactions in this t range. High intensity and large geometrical acceptance were required in order to measure the low cross sections. The experiment used a double-arm spectrometer. MWPCs were used for reconstruction, and threshold and differential Cerenkov counters for identification. Scintillation counters, Cerenkov counters and a hadron calorimeter were used in the trigger. The trigger logic utilized specially designed matrices and a hard wired microprocessor. The π^-p elastic scattering cross sections follow approximately the dimensional counting rule from 3.5 GeV/c and up to 30 GeV/c. The cross sections decrease by seven orders of magnitude in this energy range. The data is compared to quark models. None of these models give a comprehensive description of the results. However, some modifications to these models improve their consistency with the data. (38 refs.)
60067 Multi-gluon exchange in pp elastic scattering. A.Donnachie, P.V.Landshoff (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England). *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.345-8 (7 April 1983). pp elastic scattering data over the ISR range of energies are analysed in terms of multi-gluon exchange. At large values of t three-gluon exchange dominates. At small t the dominant mechanism is a version of the Chou-Yang model improved to incorporate multi-gluon effects. All features of the data are described correctly, with very few adjustable parameters. (8 refs.)

60068 Measurement of the Ξ^-p elastic cross section at 102 and 135 GeV/c. S.F. Biagi (Queen Mary Coll., Univ. of London, London, England), M. Bourquin, A.J. Britten, R.M. Brown, H. Burckhardt, A.A. Carter, J.R. Carter, Ch. Dore, P. Extermann, M. Gailloud, C.N.P. Gee, W.M. Gibson, J.C. Gordon, R.J. Gray, P. Igokemenes, W.C. Louis, T. Modis, P. Muhlemann, J. Perrier, Ph. Rosset, B.J. Saunders, P. Schirato, H.W. Siebert, V.J. Smith, D.P. Stickland, K.-P. Streit, J.J. Thresher, R. Weill.

Z. Phys. C (Germany), vol.17, no.2, p.113-19 (1983).

The Ξ^-p differential elastic cross section has been measured in the SPS hyperon beam at 102 and 135 GeV/c. In the range $0.01 < -t < 0.42$ (GeV/c)², the t distributions are found to be compatible with the form $A \exp(Bt)$ where B is 7.7 ± 0.4 (GeV/c)⁻² at 102 GeV/c and 8.2 ± 0.5 (GeV/c)⁻² at 135 GeV/c. The corresponding total elastic cross sections are $\sigma_{el} = 4.9 \pm 0.7$ mb and $\sigma_{el} = 5.6 \pm 0.9$ mb, respectively. These results are compared with the predictions of phenomenological models. (15 refs.)

60069 A study of the pion-pair produced in the reaction $pp \rightarrow pp\pi^+\pi^-$ at 19 GeV/c in view of the possibility of gluon Bremsstrahlung. T. Jacobsen, V. Bakken (Inst. of Phys., Univ. of Oslo, Oslo, Norway).

Phys. Scr. (Sweden), vol.27, no.2, p.65-8 (Feb. 1983).

Presents some experimental results for the production of pion-pairs in proton-proton collisions at 19 GeV/c by analogy to electromagnetic Bremsstrahlung. The observed features are consistent with the concept of gluon Bremsstrahlung. (5 refs.)

13.85K Inclusive reactions, including total cross sections, (energy > 10 GeV)

60070 Charged hyperon production by 400 GeV/c protons. L.J. Teig (Yale Univ., New Haven, CT, USA), E.W. Anderson, C. Ankenbrandt, J.P. Berge, A. Breakstone, A.E. Brenner, J. Butler, T.R. Cardello, P.S. Cooper, K. Doroba, J. Elias, J. Lach, P. Laurikainen, J. MacLachlan, J.P. Marriner, E. McCliment, E.I. Rosenberg, J.L. Thron, Y.W. Wah.

AIP Conf. Proc. (USA), no.95, p.95-101 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

Reports preliminary results from Fermilab Experiment B-497 on the x and p_t dependence of charged hyperon and anti-hyperon production by 400 GeV/c protons on a Cu target. (6 refs.)

60071 Fire-string formation at high energies: pp versus $\bar{p}p$. L. Angelini, L. Nitti, M. Pellicoro, G. Preparata (Istituto di Fisica, Univ. di Bari, Bari, Italy), G. Valenti.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.1, p.83-99 (25 April 1983).

A comparison of hadron production in pp and $\bar{p}p$ interactions at $\sqrt{s}=53$ GeV has been carried out using the theoretical approach of fire-string formation. The authors find basically no differences between the two processes as clearly indicated by recent experimental information. (15 refs.)

60072 Polarization of Λ^0 hyperons in inclusive production by 12-GeV protons on tungsten. F. Abe, K. Hara, N. Kim, K. Kondo, S. Miyashita, H. Miyata, I. Nakano, T. Sugaya, R. Tanaka, K. Takikawa, Y. Yamamoto, T. Yasuda, K. Yasuoka (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), Y. Asano, Y. Iguchi, S. Mori, Y. Fukui, S. Kurokawa, A. Maki.

Phys. Rev. Lett. (USA), vol.50, no.15, p.1102-5 (11 April 1983).

The authors have measured the polarization of $2.4 \times 10^5 \Lambda^0$ hyperons in inclusive production by 12-GeV protons on tungsten at three production angles, 3.5° , 6.5° , and 9.5° . In terms of Feynman's x_F and transverse momentum of Λ^0 , the kinematical range is $0.3 \leq x_F \leq 0.8$ and $0.4 \leq p_T \leq 1.6$ GeV/c. The observed polarization does not depend strongly on x_F and increases linearly with p_T to 16% at $p_T=1.0$ GeV/c, showing a tendency to level off above that point. (8 refs.)

60073 Forward-backward multiplicity correlations in $\bar{p}p$ -collisions at $\sqrt{s}=540$ GeV. K. Alpgard (Inst. of Phys., Univ. of Stockholm, Stockholm, Sweden), R.E. Ansorge, B. Asman, S. Berglund, K. Berkelman, D. Bertrand, K. Bockmann, C.N. Booth, C. Buffam, L. Burrow, P. Carlson, J.-L. Chevalley, B. Eckart, G. Ekspong, I. Evangelou, J.-P. Fabre, K.A. French, J. Gaudaen, C. Geich-Gimbel, M. Gijzen, K. von Holt, R. Hospes, D. Johnson, K. Jon-and, Th. Kokott, R. Mackenzie, M.N. Maggs, R. Meinke, Th. Muller, H. Mulkens, D.J. Munday, A. Odian, J.G. Rushbrooke, H. Saarikko, T. Saarikko, F. Triantis, Ch. Walck, C.P. Ward, D.R. Ward, G. Weber, A.R. Weidberg, T.O. White, G. Wilquet, Y. Hamdagni.

Phys. Lett. B (Netherlands), vol.123B, no.5, p.361-6 (7 April 1983).

Results on correlations in charged multiplicities are presented using data from the UA5 detector at the CERN SPS collider. Both short-range and long-range correlations are observed. The analysis gives no evidence for intrinsic long-range correlations. The observations are consistent with a physical picture in which small clusters are emitted at random along the rapidity axis in the plateau region. This result may indicate that random soft processes play a dominant role in high energy hadronic collisions. The average cluster size is about 2 charged particles, the same as at ISR energies. No variation of cluster size with multiplicity has been observed. The forward-backward long-range correlation and its energy dependence are related to the ratio of the first two moments, variance/mean, of the multiplicity distributions. (8 refs.)

60074 High- p_T direct photon production at 11° in pp collisions at $\sqrt{s}=63$ GeV. T. Akesson (Univ. of Lund, Lund, Sweden), M.G. Albrow, S. Almedeh, R. Bailey, O. Benary, H. Boggild, O. Botner, H. Brody, V. Burkert, R. Carosi, W. Cleland, D. Cockerill, S. Dagan, E. Dahl-Jensen, I. Dahl-Jensen, G. Damgaard, A. Di Ciacio, W.M. Evans, C.W. Fabjan, P. Frandsen, S. Frankel, W. Frati, H. Gordon, U. Goerlach, A. Hallgren, K.H. Hansen, M. Harris, B. Heck, H.J. Hilke, J.E. Hooper, G. Jarlskog, P. Jeffreys, T. Jensen, G. Kessler, T. Killian, K. Kroeger, J.v.d. Lans, D. Lissauer, B. Lorstad, H. Lubatti, T. Ludlam, I. Manelli, A. Markou, N.A. McCubbin, F. Meyer, U. Mjornmark, R. Moller, W. Molzon, A. Nappi, B.S. Nielsen, A. Nilsson, L.H. Olsen, Y. Oren, G. Pierazzini, L. Rosset, E. Rosso, R.H. Schindler, B. Schistad, I. Stumer, M. Sullivan, J. Thompson, E. Vella, W.J. Willis, M. Winik, W. Witzeling, C. Woody.

Phys. Lett. B (Netherlands), vol.123B, no.5, p.367-72 (7 April 1983).

The production of direct photons has been measured relative to π^0 's in the rapidity range $2.00 < y < 2.75$ in pp collisions at $\sqrt{s}=63$ GeV at the CERN Intersecting Storage Rings. The γ/π^0 ratio increases from $\leq 2\%$ at $p_T=1.5$ GeV/c to $\sim 8\%$ at $p_T=4.25$ GeV/c, similar to the value observed near 90° . The results indicate no strong enhancement of single-photon production due to quark bremsstrahlung in this kinematic region. (11 refs.)

60075 Fluctuations in the hadronic temperature in pp, $p\alpha$ and $\alpha\alpha$ collisions at ISR energies. K. Braune (Univ. Heidelberg, Heidelberg, Germany), A. Breakstone, R. Campanini, G.O. Claesson, H.B. Crawley, G.M. Dallavalle, K. Doroba, D. Drijard, F. Fabbri, M. Faessler, A. Firestone, H.G. Fischer, H. Frehe, S.I.A. Garpmann, W. Geist, G. Giacomelli, R. Gokiel, M. Gorbics, Ch. Gruhn, P. Hanke, M. Heiden, W. Herr, W. Hofmann, P.G. Innocenti, T.J. Ketel, E.E. Kluge, J.W. Lamsa, T. Lohse, W.T. Meyer, G. Mornach, T. Nakada, I. Otterlund, M. Panter, B. Povh, A. Putzer, K. Rauschnabel, B. Rensch, F. Rimondi, R. Sosnowski, J. Spengler, E. Stenlund, T.J.M. Symons, M. Szczekowski, R. Szwed, O. Ullaland, D. Wegener, M. Wunsch.

Phys. Lett. B (Netherlands), vol.123B, no.6, p.467-70 (14 April 1983).

The authors present evidence for fluctuations of the average transverse momentum in pp, $p\alpha$ and $\alpha\alpha$ collisions at ISR energies. In thermodynamical models, this is interpreted as fluctuations in the temperature of hadronic interactions. They find that the effect does not depend on the energy of the collision, however, the fluctuations are smaller for $p\alpha$ and $\alpha\alpha$ reactions than for pp interactions. (9 refs.)

60076 Search for charmed particles with the heavy liquid bubble chamber BIBC. A. Badertscher, B. Hahn, E. Hugentobler, T. Marti, U. Moser, L. Muller, E. Ramseier (Lab. of High Energy Phys., Univ. of Berne, Berne, Switzerland), I. Derado, V. Eckhardt, P. Freund, H.J. Gebauer, T. Kahl, K.P. Pretzl, P. Seyboth, J. Seyerlein, M. Vidal.

Phys. Lett. B (Netherlands), vol.123B, no.6, p.471-6 (14 April 1983).

In a search for short lived particles with a high resolution C_3F_8 bubble chamber and a streamer chamber, 21 charmed meson candidates produced by 340 GeV/c π^- have been identified. The cross section for associated charm production is $(28 \pm 11) \mu\text{b}$ per nucleon assuming a linear A -dependence. The mean lifetimes of the D mesons in units of 10^{-13} s are $\tau(D^0, D^{\pm}) = 4.1_{-1.3}^{+2.0} \pm 0.5$, $\tau(D^{\pm}) = 6.3_{-2.3}^{+4.8} \pm 1.5$. (8 refs.)

60077 Hadron production in π^+ and π^- neon interactions at 30 and 64 GeV/c. C.D. Rees, H.J. Lubatti, K. Moriyasu, D. Rock (Dept. of Phys., Univ. of Washington, Seattle, WA, USA), R. Arnold, J.L. Guyonnet, M. Paty, J.L. Riester, H. Abramowicz, H. Bialkowska, K. Doroba, M. Szeptycka, S. Tkacz, A.K. Wroblewski, A. Ziemiński.

Z. Phys. C (Germany), vol.17, no.2, p.95-103 (1983).

Reports new results on charge multiplicities from π^+ Ne and π^- Ne interactions at 30 and 64 GeV/c. The average number of fast protons is extracted and found to be essentially independent of the number of identified slow protons. (18 refs.)

60078 Particle production in high-energy hadron-nucleus interactions. K. Braune, W. Bruckner, M.A. Faessler, R.W. Frey, P.C. Gugelot, T.J. Ketel, J. Niewisch, S. Otwinowski, B. Povh, E. Stenlund, M. Uhrmacher (Max-Planck Inst. fur Kernphys., Heidelberg, Germany).

Z. Phys. C (Germany), vol.17, no.2, p.105-12 (1983).

The pseudorapidity distributions of fast particles ($\beta > 0.7$) emitted in inelastic hadron interactions with carbon, copper and lead were measured for incoming energies from 50 to 150 GeV at the CERN super proton synchrotron. Their dependence on target mass and projectile obeys (ν)-scaling as expected. Their energy dependence is in contrast with most model predictions. (21 refs.)

60079 Second order QCD corrections to $q\bar{q}$ -annihilation into a lepton pair at large transverse momentum. H. Perlt (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).

Z. Phys. C (Germany), vol.17, no.2, p.153-60 (1983).

The $\mathcal{O}(\alpha_s^2)$ correction is presented to $q\bar{q}$ -annihilation into a lepton pair at large transverse momentum. The author calculates the corresponding hadron cross section difference $d\sigma/d^4q(p\bar{p} - e^+e^- + x)$ (q is the momentum of the lepton pair system). The correction to this cross section difference is found to be large. This essentially agrees with recently published results by Ellis, Martinelli and Petronzio (1981). Two important approximations are used: the in invariant mass of the two-gluon-system is put to zero, and only valence-quark scattering is considered. (20 refs.)

13.88 POLARISATION IN INTERACTIONS AND SCATTERING

60080 Hyperon polarization produced in meson-proton collisions in the beam fragmentation region. J.R. Bensinger (Brandeis Univ., Waltham, MA, USA).

AIP Conf. Proc. (USA), no.95, p.77-82 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

Presents new data on hyperon polarization in the beam fragmentation region from 2 BNL-MPS experiments. One sees little or no Λ polarization in the reaction $\pi^- p \rightarrow \Lambda X$ at 16 GeV and very substantial Σ^- polarization in the reaction $K^- p \rightarrow \Sigma^- X$. The author also reviews the polarization of hyperons from meson induced reactions and compares them with the proton-proton results. (8 refs.)

60081 Polarization of inclusively produced hyperons. B.Lundberg, G.Bunce, R.Handler, R.Grobel, R.March, P.Martin, L.Pondrom, M.Sheaff, C.Wilkinson (Univ. of Wisconsin, Madison, WI, USA), P.T.Cox, J.Dworkin, E.C.Dukes, O.E.Overseth, P.Skubic, K.Heller, C.James, A.Beretvas, L.Deck, T.Devlin, B.Edelman, R.T.Edwards, K.B.Luk, J.Norem, P.Petersen, R.Rameika, L.Schachinger, G.Thomson, R.Whitman, P.Yamin. *AIP Conf. Proc. (USA)*, no.95, p.83-9 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

The authors report here polarization results from a series of Fermilab experiments from the years 1974 through 1980, with some preliminary data from a high p_T polarization experiment completed in February 1982. The Λ polarization has a remarkably simple and interesting behavior when expressed as a function of x_F and p_T . (10 refs.)

60082 Polarized Λ^0 production at KEK. K.Takikawa, F.Abe, K.Hara, N.Kim, K.Kondo, S.Miyashita, H.Miyata, I.Nakano, T.Sugaya, R.Tanaka, Y.Yamamoto, T.Yasuda, K.Yasuoka (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), Y.Asano, Y.Iguchi, S.Mori, Y.Fukui, S.Kurokawa, A.Maki. *AIP Conf. Proc. (USA)*, no.95, p.90-4 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

The authors have measured the polarization of Λ^0 hyperons produced inclusively by 12 GeV protons on tungsten at KEK. For moderate x_F ($0.2 < x_F < 0.7$), the polarization is nearly independent of x_F and increases roughly linearly with p_T . As x_F increases beyond 0.7, however, the polarization shows a significant x_F dependence. Some preliminary data were taken on copper and beryllium targets. A future project on Σ^0 polarization at KEK is indicated. (10 refs.)

60083 Σ^+ and Σ^- production polarizations. P.S.Cooper (Yale Univ., New Haven, CT, USA), E.W.Anderson, C.Ankenbrandt, J.P.Berge, A.Breakstone, A.E.Brenner, J.Butler, T.Cardello, K.Doroba, J.Elias, J.Lach, P.Laurikainen, J.MacLachlan, J.Marriner, E.McCliment, L.J.Teig, J.Thron, Y.W.Wah. *AIP Conf. Proc. (USA)*, no.95, p.102-7 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

The authors report preliminary results from Fermilab experiment E-497 on the production polarizations of Σ^+ and Σ^- hyperons. Hyperons were produced inclusively at non zero production angles by 400 GeV/c protons incident on a Cu target. The polarization was analyzed by the weak decay asymmetry in the hadronic decay modes $\Sigma^+ \rightarrow p\pi^0$ and $\Sigma^- \rightarrow n\pi^-$. Based upon samples of 38000 Σ^+ and 317000 Σ^- decays they observe polarizations as a function of p_T which average 22% at an X of 0.53 for Σ^+ and 40% at X of 0.68 and 0.78 for Σ^- . The direction of polarization for both Σ^+ and Σ^- is in the direction of $K_p \times K_\pi$ where the K s are the momentum vectors of the incident proton and produced hyperon respectively. This is opposite to the direction of polarization of inclusively produced lambdas. (5 refs.)

60084 Polarization in p-p elastic scattering at high energies. A.M.T.Lin (Randall Lab. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).

AIP Conf. Proc. (USA), no.95, p.108-13 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

Some recent data on polarization in p-p elastic scattering are briefly surveyed and their characteristics reviewed. A new 28 GeV/c measurement of A , the analyzing power is presented. A few interesting theories are also briefly discussed. The author plans more measurements of A soon and plans to measure A_{NN} when the polarized beam comes on at the AGS. (25 refs.)

60085 Hyperon polarization at high P_T in the reactions $\pi^- p \rightarrow K^0 \Lambda^0$ and $p\bar{p} \rightarrow \Lambda \Lambda^0$ between 3 and 12 GeV/c. S.Schwarz, L.Bachman, M.Bogdanoski, D.Perrin (Univ. de Neuchatel, Neuchatel, Switzerland), J.Gago, P.Sonderegger, A.de Bellefon, P.Billoir, J.M.Brunet, G.Tristram, A.Volte.

AIP Conf. Proc. (USA), no.95, p.114-17 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

The authors have measured Λ and Λ^0 polarizations in exclusive $\pi^- p$ and $p\bar{p}$ reactions at 3-5 GeV/c and in semi-inclusive reactions at 3-12 GeV/c covering transverse momentum values up to 1.5 GeV/c. The main result is a large and negative polarization which may provide a clear and severe test for theoretical models. (11 refs.)

60086 Observation of the polarization in reaction $\pi^- p \rightarrow \eta n$ at 40 GeV/c. V.D.Apokin, I.A.Avvakumov, N.S.Borisov, B.V.Chuiko, Yu.M.Goncharenko, Yu.M.Kazarinov, B.A.Khachaturov, G.G.G.Macharashvili, V.N.Matafonov, Yu.A.Matulenko, A.P.Meschanin, A.I.Misnik, A.B.Neganov, S.B.Nurushev, L.B.Parfenov, A.F.Prudkoglyad, A.I.Saraykin, E.V.Smirnov, V.L.Solovyanov, L.F.Solov'yev, Yu.A.Usov, A.N.Vasilyev (Inst. for High Energy Phys., Serpukhov, USSR).

AIP Conf. Proc. (USA), no.95, p.118-25 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

The preliminary results of polarization measurements in reaction $\pi^- + p \rightarrow \eta + n$ at 40 GeV/c for the 4-momentum transfers up to 1 (GeV/c)² are presented. Averaged blue of the polarization in the t-range $0.5 < |t| < 1$ (GeV/c)² is $- (24 \pm 8)\%$. The presented data are in contradiction with existent Regge model predictions. (15 refs.)

60087 Search for polarization in Ξ^0 hyperons. R.Rameika, P.T.Cox, J.Dworkin, O.E.Overseth (Univ. of Michigan, Ann Arbor, MI, USA), K.Heller, C.James, A.Beretvas, L.Deck, T.Devlin, K.B.Luk, P.Petersen, P.Skubic, G.Thomson, R.Whitman, R.Handler, R.Grobel, B.Lundberg, L.Pondrom, M.Sheaff, C.Wilkinson, G.Bunce.

AIP Conf. Proc. (USA), no.95, p.126-9 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

Inclusive hyperon production by 400 GeV protons at Fermilab has shown that the hyperons are produced with significant polarization. However no polarization has been seen for Λ s produced at these energies. The authors present the results of a search for Ξ^0 polarization. Ξ^0 hyperons, obtained from two independent experiments, have been analyzed for inclusive polarization. The data consist of 4529 fully reconstructed events and 23500 events obtained from non-target pointing Λ s. In both experiments the hyperons were produced in the inclusive reaction $p + N \rightarrow \Xi^0 + X$. (4 refs.)

60088 Measurement of the internal spin structure of the proton. R.Oppenheim (Yale Univ., New Haven, CT, USA), G.Baum, M.R.Bergstrom, P.R.Bolton, J.E.Cledenin, N.R.DeBotton, S.K.Dhawan, R.A.Fong-Tom, Y.-N.Guo, V.-R.Harsh, V.W.Hughes, K.Kondo, M.S.Lubell, C.-L.Mao, R.H.Miller, S.Miyashita, K.Morimoto, U.F.Moser, I.Nakano, D.A.Palmer, L.Panda, W.Waith, N.Sasao, K.P.Schuler, M.L.Seely, J.Sodja, P.A.Souder, S.J.St. Lorant, K.Takikawa, M.Werlen.

AIP Conf. Proc. (USA), no.95, p.255-8 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

The final results of measurements at SLAC of the spin dependent asymmetry in the deep inelastic scattering of longitudinally polarized electrons by longitudinally polarized protons are presented. Data were obtained at a scattering angle of 10° and at incident energies of 16.2 and 22.7 GeV, which cover the kinematic range $0.18 < x < 0.70$ and $3.5 < Q^2 < 10.0$ (GeV/c)². The authors compare the results with various models of proton spin structure and with the Bjorken and Ellis-Jaffe sum rules. (18 refs.)

60089 Polarized e^+ -polarized p colliding beams: physics issues. J.D.Bjorken (Fermi Nat. Accelerator Lab., Batavia, IL, USA).

AIP Conf. Proc. (USA), no.95, p.268-80 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

The physics of collisions of polarized electrons with polarized protons at storage-ring energies is examined, with emphasis on polarization asymmetries of structure functions. The usefulness of positron-proton as well as electron-proton collisions is underlined. (14 refs.)

60090 Some comments about polarization in deep inelastic processes. R.P.Bajpai (HP Univ., Simla, India).

AIP Conf. Proc. (USA), no.95, p.335-6 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982). (4 refs.)

60091 Spin effects in jet fragmentation. G.Gustafson (Dept. of Theoretical Phys., Lund Univ., Lund, Sweden).

AIP Conf. Proc. (USA), no.95, p.355-8 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

Discusses how the polarization of inclusively produced hyperons can be understood if quarks are produced by a tunneling process in a confined colour-electric field. (7 refs.)

60092 Polarization phenomenology in the optimal representation. G.R.Goldstein (Dept. of Phys., Tufts Univ., Medford, MA, USA), M.J.Moravcsik.

AIP Conf. Proc. (USA), no.95, p.365-6 (1982). (5th High Energy Spin Symposium, Westhampton Beach, NY, USA, Sept. 1982).

The optimal representation for two body scattering provides a general framework with which study the relations between reaction amplitudes and experimental observables. The infinitude of possible coordinate systems allowed therein becomes restricted by various symmetry relations. For example identical particle constraints at 90° in the center of mass facilitate the experimental testing of dynamical models, pp elastic scattering and the question of a dibaryon resonance provides an informative application. In general the remaining freedom in coordinate systems allows the amplitude choices to be tailored to experimental amplitude from data. Alternatively the amplitude choices can be made to reveal dynamical features as illustrated by pp elastic scattering and π photoproduction. (9 refs.)

13.90 OTHER TOPICS IN SPECIFIC REACTIONS AND PHENOMENOLOGY OF ELEMENTARY PARTICLES

60093 Contact terms in $\gamma\gamma \rightarrow A_2 \pi \rightarrow \rho\pi\pi$ transitions. E.Bagan, A.Bramon, F.Cornet (Dept. de Fisica Teorica, Univ. Autonoma de Barcelona, Barcelona, Spain).

Phys. Rev. D (USA), vol.27, no.7, p.1640-3 (1 April 1983).

The contribution of contact terms (originated by gauge invariance) to the $\gamma\gamma \rightarrow A_2 \pi^+ \pi^- \rightarrow \rho^+ \pi^- \pi^-$ transitions is evaluated. Large cross sections are predicted immediately above threshold. (14 refs.)

20.00 NUCLEAR PHYSICS

21.00 NUCLEAR STRUCTURE

21.10 GENERAL AND AVERAGE PROPERTIES OF NUCLEI; PROPERTIES OF NUCLEAR ENERGY LEVELS

(for properties of specific nuclei listed by mass ranges, see 27.)

60095 Selective population of high-j states via heavy-ion induced transfer reactions. P.D.Bond. <i>Comments Nucl. & Part. Phys. (GB)</i> , vol.11, no.5, p.231-40 (1983). The unique aspects of certain heavy-ion induced transfer reactions to selectively populated high spin single particle states are discussed. The use of these reactions, in conjunction with gamma-ray coincidence work, to find previously unobserved high spin states with simple configurations is demonstrated. (10 refs.)	
60096 Search for the second excited $11/2^-$ state and weak-coupling scheme in ^{117}Sn . M.Sekiguchi, O.Hashimoto, Y.Shida, F.Soga (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan). <i>J. Phys. Soc. Jpn. (Japan)</i> , vol.52, no.4, p.1134-41 (April 1983). The second excited $11/2^-$ state in ^{117}Sn has been searched for by four different single-neutron transfer reactions, (d,t), (p,d), (d,p) and ($^3\text{He},\alpha$). The state has been found at $E_x=1.589$ MeV, very near to the $13/2^-$ and $15/2^-$ states observed in an in-beam γ -ray study. These very closely degenerate states are possible three members of the quintet of the weak-coupling scheme [$1_{1/2} \times 2^+$] in this nucleus. (24 refs.)	
60097 Mean distribution of single-particle levels in thin-skinned potential wells and the macroscopic level density parameters of nuclei. V.S.Ramamurthy (Bhabha Atomic Res. Centre, Bombay, India), M.Asghar, S.K.Kataria. <i>Nucl. Phys. A (Netherlands)</i> , vol.A398, no.3, p.544-56 (2 May 1983). A general leptodermous expansion for the density of single-particle levels in thin-skinned potential wells is derived and is used to study the finite size corrections to the macroscopic level density parameters of nuclei. With droplet model values for the potential parameters, the calculated level density parameters for nuclei along the β -stability line show systematic deviations from the experimental estimates. Possible reasons for these deviations are also discussed. (17 refs.)	
60098 Role of high multipole pairs in the description of deformed nuclei. P.Catara, A.Insolia (Istituto di Fisica, Univ. di Catania, Catania, Italy), E.Magliione, A.Vitturi. <i>Phys. Lett. B (Netherlands)</i> , vol.123B, no.6, p.375-8 (14 April 1983). The intrinsic wave function associated to the ground state rotational band of axially symmetric deformed nuclei is described as a condensate of a basic collective pair which includes components with all possible angular momenta. The microscopic structure of its pair is determined by a variational procedure within the pairing plus quadrupole model. The effect of the truncation to the components with angular momentum $\Lambda=0, 2$ only, as suggested by the interacting Boson Model, is tested. It is found that this truncation emphasizes the pairing effects with respect to the shape distortion, with major consequences on different physical observables. (7 refs.)	
60099 Excitation of the 6^- particle-hole state with the $^{40}\text{Ca}(p,n)^{40}\text{Sc}$ reaction at 133.5 MeV. B.D.Anderson, J.W.Watson, C.Lebo, A.R.Baldwin, A.Fazely, R.Madey (Dept. of Phys., Kent State Univ., Kent, OH, USA), C.C.Foster. <i>Phys. Lett. B (Netherlands)</i> , vol.123B, no.6, p.383-6 (14 April 1983). A relatively broad (~ 2.5 MeV) state was observed in ^{40}Sc at $E_x=7$ MeV, which is interpreted as the $T=1, 6^-$ stretched state with the dominant configuration $(\pi f_{7/2} \nu d_{5/2})^{-1}$. The strength observed is comparable to the (p,n) excitation of the $T=1, 6^-$ stretched in state ^{28}P , and the width is understood in terms of the spreading and decay widths of the $1d_{5/2}$ strength in ^{40}Sc . (20 refs.)	

60100 On the pairing field in nuclei. R.A.Brogia, A.Winther (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.11-13 (21 April 1983). An approximate form for the non-local pairing transition density and pairing field for pairing vibrations in nuclei is given on the basis of the Thomas-Fermi approximation. (5 refs.)

60101 Nuclear g factors of the $^{17/2-}$ and $^{21/2+}$ isomeric states of ^{91}Mo . P.Raghavan (Rutgers Univ., New Brunswick, NJ, USA), R.S.Raghavan. *Phys. Rev. C (USA)*, vol.27, no.4, p.1532-5 (April 1983). The nuclear g factors of the $^{17/2-}$ and $^{21/2+}$ isomeric states in ^{91}Mo excited by pulsed heavy-ion reactions have been measured by the time-differential perturbed γ -ray angular distribution method. The spin precession of these isomers was observed in the hyperfine field of ^{90}Mo isomer implanted into ferromagnetic Ni. The field was calibrated using a ^{90}Mo isomer of known g factor. The results are $g(^{17/2-}) = +0.531(7)$ and $g(^{21/2+}) = +0.839(8)$, which can be well described in the framework of multiparticle shell model states using effective g factors of single particle states and the additivity relation. (6 refs.)

60102 Shell model calculations using modified Sussex matrix elements for $A \leq 4$. M.R.Meder, J.E.Purcell (Dept. of Phys. & Astron., Georgia State Univ., Atlanta, GA, USA). *Phys. Rev. C (USA)*, vol.27, no.4, p.1790-8 (April 1983). The $^3\text{S}_1$ and $^3\text{S}_1\text{-}^3\text{D}_1$ Sussex matrix elements are modified by the addition of the matrix elements of a potential whose radial form is that of a momentum-dependent delta function. The strength parameters of the potential are found by fitting to the binding energy and quadrupole moment of the deuteron. Shell model calculations in a 4 $\hbar\omega$ model space using the modified matrix elements and a size parameter of 1.5 fm give binding energies of 7.55, 6.79, and 27.77 MeV for ^3H , ^3He , and ^4He , respectively. The energies of the negative parity states in ^3He are also calculated using the modified matrix elements in a 5 $\hbar\omega$ model space. It is found that their calculated absolute energies are much improved as compared to calculations using the unmodified matrix elements. The relative energies of these states are not significantly changed by the modifications, as expected. (19 refs.)

60103 An approximate calculation of the energy spectrum for particular angular momentum states. H.G.Miller, H.P.Schroder (Inst. für Theoretische Phys., Univ. Frankfurt, Frankfurt/Main, Germany). *S. Afr. J. Phys. (S. Africa)*, vol.5, no.4, p.97-9 (1982). Configuration-mixing calculations have been performed in Ne^{20} with a small number of unprojected basis states which are energetically the lowest lying solutions of the constrained Hartree-Fock equations with an angular momentum constraint of the form $\langle J^2 \rangle = J(J+1)$. For $J=6$, the spectrum of the lowest lying states, although shifted downward by about 500 keV, approximates reasonably well the exact level spectrum of the lower lying 6^+ states. (8 refs.)

60104 Energy levels of the odd manganese nuclei from the $(d, ^3\text{He})$ reaction. N.G.Puttaswamy, W.Oelert, A.Djaloeis, C.Mayer-Borick, P.Turek (Inst. für Kernphys., KFA, Jülich, Jülich, Germany). *IEEE Trans. Nucl. Sci. (USA)*, vol.30, no.2, p.1140-2 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). The $^{54,56,58}\text{Fe}(d,^3\text{He})^{53,55,57}\text{Mn}$ reactions have been studied at a bombarding energy of 80 MeV. Angular distributions have been measured in the range of 6° to 30° lab. Energy levels up to excitation energies of 9.2 MeV, 7.2 MeV, and 7.4 MeV in ^{53}Mn , ^{55}Mn , and ^{57}Mn , respectively, have been studied. DWBA calculations were employed to extract spectroscopic factors. The results concerning negative-parity levels have been compared with shell-model calculations. For the case of ^{55}Mn , a comparison of the distribution of the experimental and the shell-model $f_{7/2}$ strengths has been made. The spectroscopic strengths for $s_{1/2}$ and $d_{3/2}$ pickup are rather well predicted by QPCC and CVM calculations. (12 refs.)

21.10K Electromagnetic moments

60105 Muonic X-ray measurement of the monopole and quadrupole charge parameters of $^{154-158,160}\text{Gd}$. D.B.Laubacher, Y.Tanaka, R.M.Steffen (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA), E.B.Shera, M.V.Hoehn. *Phys. Rev. C (USA)*, vol.27, no.4, p.1772-89 (April 1983).

Monopole and quadrupole charge distributions of ^{154}Gd , ^{155}Gd , ^{156}Gd , ^{157}Gd , ^{158}Gd , and ^{160}Gd were investigated by muonic-atom K and L X-ray measurements. The model-independent Barrett charge radii R_k and the isotope shifts ΔR_k were measured, and values of $\langle r^2 \rangle$ and $\Delta \langle r^2 \rangle$ were deduced. A pronounced even-odd staggering effect of the nuclear charge radii was observed for the series $^{156-158}\text{Gd}$. The quadrupole moments of the first excited states of the even-A Gd nuclei were determined to be $Q^{154}(2^+) = -1.82(4)$ e b, $Q^{156}(2^+) = -1.93(4)$ e b, $Q^{158}(2^+) = -2.01(4)$ e b, and $Q^{160}(2^+) = -2.08(4)$ e b, and the quadrupole moments of the $3/2^-$ ground states of the odd-A $^{155,157}\text{Gd}$ nuclei were determined to be $Q^{155}(3/2^-) = 1.27(3)$ e b and $Q^{157}(3/2^-) = 1.35(3)$ e b. Comparison with a separate measurement of the odd-A ground-state quadrupole moments based on the static hyperfine splitting of the muonic M X-rays showed that the model error in the extracted quadrupole moments of these nuclei is less than 2 per cent. The quadrupole moments and the $B(E2)$ values obtained in the present experiment for the low-lying Gd states are in satisfactory agreement with the axially symmetric rotational model. However, the ^{157}Gd nucleus exhibits a considerable softness as indicated by the isomer shift of the 2^+ excited state and by the experimental value of the ratio $Q(2^+)/B(E2:0^+ \rightarrow 2^+)$. (27 refs.)

21.10M Level density and structure

60106 A study of the $^{86}\text{Sr}(^3\text{He,t})^{86}\text{Y}$ reaction. C.A.Fields, J.J.Kraushaar, R.A.Ristinen, E.Sugarbaker (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).

Nucl. Phys. A (Netherlands), vol.A398, no.3, p.434-44 (2 May 1983). Low-lying levels of ^{86}Y have been investigated using the $^{86}\text{Sr}(^3\text{He,t})$ reaction at 42.8 MeV. J^π values or limits were assigned to 20 of the 23 levels observed below 1.5 MeV through the use of collective DWBA calculations or experimental $(^3\text{He,t})$ reaction systematics. The particle-hole structure of ^{86}Y is discussed on the basis of these data and the shell model. (25 refs.)

60107 Level structure of the doubly odd nucleus ^{112}In from the $(p,n\gamma)$ reaction. T.Kohn, M.Adachi, H.Taketani (Dept. of Appl. Phys., Tokyo Inst. of Technol., Tokyo, Japan).

Nucl. Phys. A (Netherlands), vol.A398, no.3, p.493-511 (2 May 1983). Properties of the levels in ^{112}In have been studied with the reaction $^{112}\text{Cd}(p,n\gamma)^{112}\text{In}$. The level scheme of ^{112}In below 1300 keV was constructed from the γ -ray excitation functions and $\gamma\gamma$ coincidences. In ^{112}In , 22 excited states were observed and spins and parities of 8 excited states were newly assigned or restricted by comparing the measured angular distributions and linear polarizations of the decaying γ -rays as well as the excitation functions of the residual levels with the predictions of the statistical compound nucleus model. Possible configurations of the low-lying levels are discussed in terms of their decay properties and the systematics of the excited states in the neighbouring doubly odd In isotopes. (15 refs.)

60108 Level density and shell structure: Rosenzweig model revisited. T.Tsukamoto (Dept. of Phys., Tohoku Univ., Sendai, Japan). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.344-7 (Jan. 1983).

The exact number of states $C_2(N, E)$ for the Rosenzweig model is computed for $1 \leq g \leq 15$, $1 \leq N \leq 50$ and $E \leq 400$. An approximate (not asymptotic) formula is obtained by numerical fit. It is suggested that the driving force governing mass transfer has little to do with the shell structure. (12 refs.)

60109 Nuclear structure of even lead isotopes by the (p,t) reaction. M.Takahashi, T.Murakami, S.Morita (Dept. of Phys., Tohoku Univ., Sendai, Japan), H.Orihara, Y.Ishizaki, H.Yamaguchi. *Phys. Rev. C (USA)*, vol.27, no.4, p.1454-73 (April 1983).

The $^{208,206,204}\text{Pb}(p,t)^{206,204,202}\text{Pb}$ reactions have been studied at an incident energy of 51.9 MeV. With the aid of distorted-wave Born approximation calculations a number of spin and parity assignments were made. Systematic trends were observed in the experimental excitation energy of individual levels in the residual nuclei and transition strengths for three reactions. These results are compared with predictions from the shell-model wave functions. The overall agreement is satisfactory. (22 refs.)

60110 Excited states of ^{96}Ru . T.A.Walkiewicz (Edinboro State Coll., Edinboro, PA, USA), S.Raman, J.B.McGrory. *Phys. Rev. C (USA)*, vol.27, no.4, p.1710-23 (April 1983).

The nuclear excited states of ^{96}Ru were studied by means of the decays of 9.25-min and 1.55-min ^{96}Rh isomers, and the $^{93}\text{Nb}(^6\text{Li}, 3n\gamma)$ reaction. Approximately 140 γ -rays measured in these experiments were incorporated into a level scheme consisting of approximately 50 excited states. The experimental level scheme is compared with a level scheme calculated on the basis of the shell model. (14 refs.)

60111 Levels in ^{148}Ce from the decay of mass separated ^{148}La . R.L.Gill, M.Shmid, R.E.Chrien, Y.Y.Chu (Brookhaven Nat. Lab., Upton, NY, USA), A.Wolf, D.S.Brenner, K.Sistemich, F.K.Wohn, H.Yamamoto, C.Chung, W.B.Walters. *Phys. Rev. C (USA)*, vol.27, no.4, p.1732-44 (April 1983).

The level scheme of ^{148}Ce populated by β decay of ^{148}La , produced in thermal neutron fission of ^{235}U , has been studied. Ion beams of mass 148 were separated by an online isotope separator and deposited on a movable tape. Gamma-ray singles, γ - γ time, γ - γ angular correlations, and time sequenced γ and β spectra were collected. The half-life for ^{148}La was measured to be 1.05 ± 0.01 s. A level scheme for ^{148}Ce is presented including several members of the ground, β , γ , and octupole bands. The resulting level scheme has been compared with other $N=90$ nuclides and with interacting-boson-approximation-2 calculations. (32 refs.)

60112 Beta-decay energies and masses of $^{103-105}\text{In}$. J.M.Wouters, H.M.Thiersen, J.Aysto, M.D.Cable, P.E.Haustein, R.F.Parry, J.Cerny (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

Phys. Rev. C (USA), vol.27, no.4, p.1745-53 (April 1983). Decay energies of $^{103-105}\text{In}$ have been determined by β - γ coincidence spectroscopy on sources obtained from an online mass separator. Comparisons of the measured decay energies and deduced masses are made with the predictions of several different theoretical models. The ^{103}In mass is found to be more bound by 1 MeV than predicted by most models, which reproduce adequately the masses of the heavier indium isotopes. Systematic trends of the masses and neutron separation energies of the indium isotopes between the closed $N=50$ and 82 shells are presented. (30 refs.)

60113 Cluster (quadrupole-octupole) phonon model: application to ^{89}Y . C.A.Heras (Dept. de Fisica, Univ. de Oriente, Cumana, Venezuela), S.M.Abecasis. *Phys. Rev. C (USA)*, vol.27, no.4, p.1765-71 (April 1983).

A cluster-phonon model is proposed for odd-mass nuclei to describe simultaneously positive- and negative-parity states, in which octupole as well as quadrupole vibrations of the core are allowed. The cluster states include one-particle and two-particle-one-hole excitations. The residual interaction is of the quadrupole-quadrupole plus pairing type. The model is applied to ^{89}Y , whose energy levels, eigenvectors, spectroscopic factors, and electromagnetic properties are computed and compared with experiment. (16 refs.)

21.30 NUCLEAR FORCES

(see also 13.75C Nucleon-nucleon interactions)

60114 Parity nonconserving nuclear forces. E.G.Adelberger. *Comments Nucl. & Part. Phys. (GB)*, vol.11, no.5, p.189-201 (1983).

Recent experimental and theoretical progress in studies of the parity-nonconserving weak NN force is described. Emphasis is placed on results from the two-nucleon system and from simple parity-mixed doublets in light nuclei. (20 refs.)

60115 The density dependence and the range of effective projectile-nucleon interaction from optical model analysis. D.K.Srivastava, D.N.Basu, N.K.Ganguly (Variable Energy Cyclotron Centre, Calcutta, India). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.6-10 (21 April 1983).

The relations between the geometries of density distributions and potentials obtained by folding these with density dependent forces have been used to obtain empirical estimates of the range and the density dependence of effective proton-, deuteron-, helion-, and alpha-nucleon interactions, from best fit phenomenological optical potentials available in literature, for these projectiles. (23 refs.)

60116 π N p-wave field theoretical separable model. K.Nakano (Theoretische Kernphys., Univ. Hamburg, Hamburg, Germany). *Phys. Rev. C (USA)*, vol.27, no.4, p.1401-4 (April 1983).

A numerically self-consistent solution for the recently proposed field theoretical π N p-wave separable model was found by the method of singular integral equations. The method of solution and form factors are presented. (9 refs.)

60117 Relativistic shell model: momentum-transfer dependence of the effective force in nuclei. L.S.Celenza, W.S.Pong, C.M.Shakin (Dept. of Phys., City Univ. of New York, New York, NY, USA).

Phys. Rev. C (USA), vol.27, no.4, p.1799-806 (April 1983).

The authors calculate the momentum-transfer dependence of the effective nuclear interaction in a conventional model and in a recently developed relativistic model which emphasises self-consistent-field effects. These latter effects lead to major modifications in the $T=0$ interaction for $S=0$ and $S=1$ and less dramatic changes for the $T=1$ interaction. The calculational methods are similar to those used previously and involve considering only the first iteration of the self-consistent field equations. They review these methods of calculation and present some new results for the (off-shell) nucleon self-energy. (12 refs.)

21.40 FEW-NUCLEON SYSTEMS

60118 The composite particle representation theory. II. The composite particle approximation. Cheng-li Wu (Phys. Dept., Jilin Univ., Changchun, China), Da huan Feng. *Commun. Theor. Phys. (China)*, vol.2, no.1, p.811-27 (1983).

For pt.I see *ibid.*, vol.6, p.705 (1982). A method of solving the many-body problem, known as the composite particle approximation, is proposed. It is shown that a many-body system can be simplified to a composite particle system (plus one or more uncorrelated basic particles), if the binding energies of the composite particles are much larger than the excitation energies of the system, and there is domination of the collective mode for the composite particles. The interactions between the composite particles, as well as the interaction between composite and basic particles, can be evaluated from the original particle-particle interactions. Applications of this theory are indicated. (8 refs.)

21.60 NUCLEAR-STRUCTURE MODELS AND METHODS

(for hadronic atoms and molecules, see 36.10)

60119 Mesons and quarks in nuclear physics. D.S.Koltun. *Comments Nucl. & Part. Phys. (GB)*, vol.11, no.4, p.171-88 (1983).

The discovery of quark degrees of freedom in elementary particles and the concurrent theoretical developments have changed the picture of strong interactions and of the internal structure of the baryons. It is to be expected that these changes will also affect the understanding of nuclei at the subnucleon level, which have previously been the domain of meson theory. The author provides a brief introductory survey, contrasting the role of mesons and quarks in nuclei. (31 refs.)

60120 New class of supersymmetry in nuclei. A.B.Balantekin (Wright Nuclear Structure Lab., Yale Univ., New Haven, CT, USA), I.Bars, R.Bijker, F.Iachello. *Phys. Rev. C (USA)*, vol.27, no.4, p.1761-4 (April 1983).

The authors suggest that a new class of supersymmetry may occur in nuclei. They construct energy formulas and classification schemes for two specific cases of this class. With this addition, supersymmetry considerations may be extended to many nuclei, thus providing a useful tool to analyze the corresponding spectra. (14 refs.)

21.60E Collective models

60121 Microscopic study of the interaction between like bosons in IBM-2. I. Allart (Natuurkundig Lab., Vrije Univ., Amsterdam, Netherlands), G. Bonsignori.

Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.1-5 (21 April 1983).
Using the microscopic two-broken-pair model, the authors studied the interaction between neutron bosons in IBM-2 for the $54 \leq N \leq 78$ region. They demonstrate that the empirically observed attraction between d-bosons in the middle of the shell, especially when they couple to $J=0$, is due to large fractions of S'-pair structure in the two-D-pair states. This results is independent of whether one employs a particle-pair, hole-pair or particle-hole pair approach. They suggest that it is worth while to include the seniority changing parameters $\nu \sim 0$ and $\nu \sim 2$ in phenomenological IBM-2 fits nuclei near the edges of the shell. (14 refs.)

60122 The path integral approach for the nuclear collective motion. D. Galetti, S.S. Mizrahi, B.M. Pimentel (Istituto di Fisica Teorica, Sao Paulo, Brazil).

Phys. Scr. (Sweden), vol.27, no.2, p.72-6 (Feb. 1983).
A procedure is developed for treating a nuclear collective motion via the path integral formalism by defining a collective propagator in the 'phase space' of the collective subspace. This collective subspace is projected out of the full many-body Hilbert space by an approach of the Generator Coordinate Method. Under the approximation of quadratic 'momentum' dependence the authors write the propagator in the coordinate representation from which may derive the collective Schrodinger equation in terms of a canonical pair P and Q . 60123 A Jacobi equation on the coset manifold $SO(2N)/U(N)$ and the quasi-particle RPA equation. S. Nishiyama (Dept. of Phys., Kochi Univ., Kochi, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.100-12 (Jan. 1983).
Studies the variational properties of the action functional appeared in the time-dependent Hartree-Bogoliubov (TDHB) theory. Through the calculus of the second variation on the coset manifold $SO(2N)/U(N)$, the Jacobi equation is obtained. Assuming the periodic Jacobi field the author derives in a natural way the equation for the quasi-particle random phase approximation (RPA) describing the collective excitation around certain static HB fields. The present method of obtaining the $SO(2N)$ RPA may be useful to get the $SO(2N+1)$ RPA. (13 refs.)

60124 Classical and quantum mechanical aspects of time-dependent Hartree-Fock trajectories. T. Suzuki (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark).

Nucl. Phys. A (Netherlands), vol.A398, no.3, p.557-96 (2 May 1983).
In terms of a quantum mechanical representation based on Slater determinants, classical and quantum mechanical aspects of TDHF trajectories are investigated. The invariant integration measure of the determinantal representation is obtained in a general closed form. Phase space structures of the TDHF equation and its solutions are discussed on this basis. The formal classical structures provide a way of finding a semiclassical expression for the quantum mechanical propagator, into which the superposition principle among TDHF trajectories is incorporated. General properties of the semiclassical propagator such as the time translation/reversal symmetry, unitarity, etc. are studied. Two simple Hamiltonian systems are employed as examples which exhibit analytical solutions for the propagator. To illustrate the effects of

superposition of TDHF paths, a system of interacting two-level nuclei is numerically studied and a comparison with the exact result is made. (59 refs.)

21.65 NUCLEAR MATTER

60125 Properties of quark matter governed by quantum chromodynamics. I. The screened charge. V. Soni (Dept. of Theoretical Phys., Univ. of Madras, Madras, India).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.1, p.244-66 (25 April 1983).

A genuine screened charge (coupling) is constructed for quark matter, subject to a flavour constraint, governed by quantum chromodynamics. This is achieved by working in the Coulomb gauge, and using an unambiguous renormalization prescription (formulated in terms of the Lie differential equations) to overcome the problems of the previous attempts. Since one must standardize with the vacuum QCD running (experimental) coupling constant at some asymptotic spacelike momentum transfer, $|p_0|$, it is ensured that the matter contribution is negligible at this point by the condition, $\mu \ll |p_0|$, where μ is the matter (flavour) chemical potential. The screened charge (coupling) has the expected property of merging with the vacuum QCD running coupling constant in the ultraviolet ($p^2 \rightarrow \infty$) and going to zero in the infrared ($p^2 \rightarrow 0$), indicative of complete screening above a critical value of μ . The critical length scale at which the screened charge diverges is well below the vacuum QCD scale length and screening always renders the screened charge smaller than its vacuum QCD counterpart. This gives greater access to the long-distance phenomena besides providing a better expansion parameter for perturbative calculations. The richer physical content of the screened charge is pointed out. The quark mass is included and taken to be renormalized on-shell. (11 refs.)

60126 Properties of quark matter governed by quantum chromodynamics. II. Renormalization schemes in quark matter. V. Soni (Dept. of Theoretical Phys., Univ. of Madras, Madras, India).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B216, no.1, p.267-76 (25 April 1983).

For pt.I see ibid., vol.216, no.1, p.244-66 (1983). Renormalization schemes are examined (in the Coulomb gauge) for quantum chromodynamics in the presence of quark matter. The author demands that the effective coupling constant for all schemes become congruent with the vacuum QCD running coupling constant as the matter chemical potential, μ , goes to zero. Also, to enable one to standardize with the vacuum QCD running coupling constant at some asymptotic momentum transfer, $|p_0|$, the author keeps $\mu \ll |p_0|$, to ensure that the matter contribution is negligible at this point. This means all schemes merge with vacuum QCD at $|p_0|$ and beyond. Two renormalization group invariants are shown to emerge: (i) the effective or invariant charge, g_{inv} , which is, however, scheme dependent and (ii) $g^2(M)/S(M)$, where $S(M)^{-1}$ is the Coulomb propagator, which is scheme independent. The only scheme in which g_{inv}^2 is scheme independent and identical to $g^2(M)/S(M)$ is the screened charged scheme characterised by the normalization of the entire Green function, S^{-1} , to unity. It is concluded that this is the scheme to be used if one wants to identify with the experimental effective coupling in perturbation theory. However, if one does not restrict to perturbation theory all schemes should be allowed. Although the author discusses matter QCD in the Coulomb gauge, the above considerations are quite general to gauge theories in the presence of matter. (3 refs.)

60127 A mathematical approach to the nuclear-matter problem. C. Villi (Istituto di Fisica, Univ. di Padova, Padova, Italy).

Nuovo Cimento A (Italy), vol.74A, ser.2, no.1, p.37-116 (1 March 1983).
Outlines a mathematical scheme for the description of the overall behaviour of infinite nuclear matter: it has been conceived with the pragmatic purpose of providing simple tools for carrying out realistic numerical calculations. To this end the author revives some insufficiently explored aspects of vintage theories, which seem to have been by-passed by recent theoretical developments. (64 refs.)

60128 Extended folding potential model for Λ -deuteron system with hard core potential. K. Hasegawa, Y. Yamamoto, H. Bando (Div. of Math. Phys., Fukui Univ., Fukui, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.171-80 (Jan. 1983).
An extended folding potential model for the Λ -d system is proposed to treat both the bound state and scatterings within the same framework by using hard core potentials. This model is derived by a variational method to take into account interparticle correlations. The Λ -d scattering length and the binding energy of $^{\Lambda}\text{H}$ are calculated with the effective central potential proposed by Dalitz et al. (1972). The present model is proved advantageous not only in handling hard core potentials but also in visualizing the physical structure of the Λ -d system. (9 refs.)

60129 Energy and projectile dependence of nuclear alignment in fusion-evaporation reactions. V.Zobel, L.Cleeman, J.Eberth, T.Heck, K.Husing, W.Neumann, M.Nolte (Inst. fur Kernphys., Univ. zu Koln, Koln, Germany). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.389-94 (1 April 1983).

Nuclear alignment attenuation coefficients of excited levels in ^{67}Ga have been measured via the reactions $^{64}\text{Zn}+\alpha$ and $^{51}\text{Fe}+^{12}\text{C}$ for incident energies between 9 and 22 MeV and 32 and 48 MeV, respectively. The data were deduced from angular distributions of four pure electric quadrupole transitions in ^{67}Ga . For the heavy-ion induced reaction a slight decrease of alignment with incident energy has been observed while there is a strong energy dependence of nuclear alignment for the α -induced reaction due to the feeding mechanism. The attenuation coefficients are consistent with the Gaussian magnet substate population hypothesis except where direct and cascade feeding compete with comparable intensities. (10 refs.)

60130 Neutron and proton matrix elements for low-lying 2^+ transitions and the probe dependence of the nuclear deformation parameter. A.M.Bernstein, V.R.Brown, V.A.Madsen.

Comments Nucl. & Part. Phys. (GB), vol.11, no.5, p.203-15 (1983). It is shown that the ratio of multiple matrix elements M_n and M_p of neutrons and protons in the nucleus is not simply proportional to N/Z as in the homogeneous collective model but depends on the shell structure of the nucleus. Correspondingly, the deformation parameter for nuclear neutrons is in general different from that of protons. This difference results in a dependence of the measured deformation parameter δ for a given transition on the external field which produces it. The systematics of M_n/M_p for single-closed shell and the external field dependence of δ is demonstrated for the low-lying collective 2^+ transitions. (19 refs.)

60131 The decay of Ag-105g. Jasbir Singh, M.L.Garg, Ravinder Kaur, S.S.Sooch, Nirmal Singh, P.N.Trehan (Dept. of Phys., Panjab Univ., Chandigarh, India).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1143-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The level structure of Pd-105 has been studied from the decay of Ag-105g. The energies and intensities of 50 gamma rays have been precisely measured using a 64.1 CC Ge(Li) detector (FWHM=2.1 keV at 1.33 MeV). The gamma ray singles spectrum measurements confirm the existence of the 158.93, 167.5, 202.17, 216.11, 382.5, 486.65, 576.64, 583.01, 844.34, 860.20, 921.23, 929.01 and 1124.90 keV gamma rays in the decay of Ag-105g. However, the 270.5, 564.39, 580.13, 610.0, 640.5, 709.8, 768.9 and 796.25 keV weak transitions reported by earlier workers could not be observed in the present investigations. Also the γ - γ directional correlation coefficients for 7 cascades in Pd-105 have been measured. Out of these, the 361-(447)-280 and 807-280 keV cascades have been attempted for the first time. From these correlation measurements spin value of $1/2^+$ has been confirmed for the 673.03 keV level. Also these measurements have been used to deduce the multipole mixing ratios of seven transitions in Pd-105. (12 refs.)

60132 Absolute strength determinations of dipole transitions and unique spin-parity assignments in ^{52}Cr and ^{56}Fe . P.B.Smith, W.Segeth (Lab. voor Algemene Natuurkunde, Univ. of Groningen, Groningen, Netherlands).

Nucl. Phys. A (Netherlands), vol.A398, no.3, p.397-407 (2 May 1983). Two strong levels at 9.14 MeV in ^{52}Cr and ^{56}Fe have been excited by resonance fluorescence with linearly polarized mono-energetic gamma rays. Both decay to the ground state with essentially 100% probability. The azimuthal and polar asymmetry of the resonance-scattered radiation lead to unique spin-parity assignments of $J^\pi=1^+$ and $J^\pi=1^-$ for the ^{52}Cr and ^{56}Fe levels, respectively. Resonance absorption measurements lead to absolute determination of the ground-state transition strengths. (9 refs.)

60133 Search for M1 strength in ^{51}V and the difference in $^{51}\text{V}(e,e')$ and $^{51}\text{V}(p,p')$ spectra. D.Bender, G.Eulenberg, A.Richter, E.Spamer (Inst. fur Kernphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), B.C.Metsch, W.Knupper.

Nucl. Phys. A (Netherlands), vol.A398, no.3, p.408-14 (2 May 1983). Following the studies of the distribution of M1 strength in the even-even $N=28$ isotones ^{48}Ca , ^{50}Ti , ^{52}Cr and ^{54}Fe by inelastic electron scattering, the result of a search for M1 transitions in the odd-even $N=28$ nucleus ^{51}V is reported. No strong M1 excitation has been detected, in contrast to a recent (p,p') experiment. There is no immediate explanation for this discrepancy. Shell-model calculations indicate that a part of it might be accounted for by an interference between the spin and orbital terms of the electromagnetic transition operator in the (e,e') experiment. (9 refs.)

60134 A study of the $^{84}\text{Kr}(a,2n)^{86}\text{Sr}$ reaction. C.A.Fields, F.W.N.De Boer (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA), J.Sau.

Nucl. Phys. A (Netherlands), vol.A398, no.3, p.512-24 (2 May 1983). Decay properties of levels of ^{86}Sr populated by the $^{28}\text{MeV } ^{84}\text{Kr}(a,2n\gamma)$ reaction have been studied by in-beam γ -ray spectroscopy. The observation of several new levels with $J^\pi \geq 6$ allows a detailed comparison of the $2p$ - $2n$ structures of ^{86}Sr with those of neighboring $N=48$ nuclei. The results are discussed in terms of the weak-coupling model. (20 refs.)

60135 The theorem of Ehrenfest in the theory of direct radiative transitions between unbound states. V.A.Pluyko, V.A.Poyarkov (Kiev State Univ., Kiev, USSR).

Phys. Lett. B (Netherlands), vol.123B, no.6, p.373-4 (14 April 1983). The validity of Ehrenfest's theorem in the theory of radiative transitions between unbound states is proved in the calculation of probability amplitudes. (6 refs.)

60136 Transition densities for charge-exchange components of giant isovector resonances and the proton-neutron density distributions in nuclei. N.Auerbach (Los Alamos Nat. Lab., Los Alamos, NM, USA), A.Klein.

Phys. Rev. C (USA), vol.27, no.4, p.1818-21 (April 1983). Sum rules that hold in the case of a self-consistent charge-exchange random-phase approximation theory are used here to derive transition densities for the charge-exchange components of isovector giant resonances. The derived transition densities are then employed in a calculation of (π^+, π^0) cross sections. (15 refs.)

60137 Level structure of ^{109}Ag from studies of the decay of ^{109}Pd . C.Dednam, D.W.Mingay (Phys. Div., Nuclear Dev. Corp. of South Africa, Pretoria, S Africa).

S. Afr. J. Phys. (S. Africa), vol.5, no.4, p.100-10 (1982). The energy levels of ^{109}Ag , populated in the decay of ^{109}Pd ($T_{1/2}=13.45$ h), have been studied by means of high-resolution Ge(Li) detectors using both time-dependent singles and coincidence gamma-ray detection techniques. Generally good agreement with previous measurements was obtained in terms of the energy levels and decay scheme of ^{109}Ag , with the exception of the 697- and 811-keV levels originally proposed by El Bedewi et al. (1975). These are shown to have arisen as a result of the misidentification of transitions. The resultant energy level diagram and branching ratios deduced are presented. The half-life of ^{109}Pd was measured as 13.45 ± 0.02 h. (27 refs.)

60138 Calorimetric redetermination of the half-life of ^{90}Sr . H.Ramthun (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.445-8 (1 April 1983). Measurements of the heat power of a sealed $^{90}\text{Sr}+^{90}\text{Y}$ source carried out over a period of 19 years yielded a half-life $T_{1/2}=28.99 \pm 0.25$ a. A description is given of the source, the calorimeter and the evaluation method used. (11 refs.)

60139 Final state branching ratio in the ^7Be decay. D.P.Balamuth, L.Brown, T.E.Chapuran, J.Klein, R.Middleton, R.W.Zurmuhle (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).

Phys. Rev. C (USA), vol.27, no.4, p.1724-7 (April 1983). The fractional decay branch in the EC decay of ^7Be leading to the first excited state of ^7Li has been measured. ^7Be ions from a beam produced by a tandem Van de Graaff accelerator were implanted into a surface-barrier detector; the decay γ -rays were then counted using a well-shielded Ge(Li) detector of known absolute efficiency. The resulting decay branch, $(10.10 \pm 0.45)\%$, is in good agreement with previously published values and in strong disagreement with a recent measurement. (14 refs.)

60140 ^7Be decay scheme and the solar neutrino problem. E.B.Norman, T.E.Chupp, K.T.Lesko, J.L.Osborne (Nuclear Phys. Lab., Univ. of Washington, Seattle, WA, USA), P.J.Grant, G.L.Woodruff.

Phys. Rev. C (USA), vol.27, no.4, p.1728-31 (April 1983). The decay scheme of ^7Be has been reinvestigated. Known numbers of ^7Be nuclei were produced in targets via the $^7\text{Li}(p,n)$ reaction. Following activation, the yields of 478-keV γ -rays from the targets were measured. From three such measurements, performed at different bombarding energies, the ^7Be decay branching ratio to the first excited state of ^7Li has been determined to be $10.8 \pm 0.4\%$. The implications of this result for the solar neutrino problem are discussed. (26 refs.)

60141 $1/2^+ \rightarrow 1/2^+$ beta decay with neutrino mass effects in the elementary particle treatment of weak interactions. Chong-en Wu (Guangxi Univ., Nanning, China), W.W.Repko.

Phys. Rev. C (USA), vol.27, no.4, p.1754-60 (April 1983). The authors compute the effect of a nonvanishing neutrino mass on the electron spectrum of tritium beta decay using the elementary particle treatment of weak interactions. Coulomb corrections are taken into account in this formalism, as are the effects of weak magnetism and nuclear recoil. The effect of a mixture of excited atomic final states is also discussed. These corrections combine to make small changes in the shape of the end point, which could be important in determinations of the neutrino mass. (9 refs.)

60142 Atomic final-state interactions in tritium decay. R.D.Williams, S.E.Koonin (W.K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA).

Phys. Rev. C (USA), vol.27, no.4, p.1815-17 (April 1983). The authors calculate the effect of the Coulomb interaction of the ejected β ray with the bound atomic electron in the β decay of a tritium atom. The excited state probabilities of the residual helium ion are changed by at most 0.17% from the usual sudden approximation. (8 refs.)

60143 Emission of heavy neutrinos in muon capture. J.P.Deutsch, M.Lebrun, R.Prieels (Inst. de Phys., Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).

Phys. Rev. D (USA), vol.27, no.7, p.1644-7 (1 April 1983). The possible use of various muon-capture observables is assessed in the search for heavy neutrinos mixed in the dominant variety. Existing data on the triton recoil spectrum measured in the reaction $\mu^- + ^3\text{He} \rightarrow ^3\text{H} + \nu$ readily allow the exclusion of the emission of heavy neutrinos of mass m_{ν_j} between 60 and 72 MeV/ c^2 with probability higher than $|U_{\mu j}|^2 \approx 0.01$. This complements limits on $|U_{\mu j}|^2$ obtained from the reactions $\pi^- \rightarrow \mu^- \nu_\mu$ and $K^- \rightarrow \mu^- \nu_\mu$. (19 refs.)

60144 Neutrinoless double- β decay with quasi-Dirac neutrinos. J.W.F.Valle (Dept. of Phys., Syracuse Univ., Syracuse, NY, USA).

Phys. Rev. D (USA), vol.27, no.7, p.1672-4 (1 April 1983). A mechanism to generate the neutrinoless double- β decay process with quasi-Dirac neutrinos and no right-handed currents is described. Relatively heavy neutrinos can easily be made consistent with the constraints on the $(\beta\beta)_0$ rate. The proposed scheme for the violation of lepton number can in principle be distinguished from a Majorana mass in $\Delta L=2$ oscillation phenomena. (12 refs.)

23.60 ALPHA DECAY

60145 A search on the parity-forbidden alpha width of the $E_{\alpha}=4.753$ MeV ($J^{\pi}, T=0^{+}, 1$) level of ^{18}F . F.Lecchia, P.Hubert, P.Mennrath (Inst. Nat. de Phys. Nucleaire et de Phys. des Particules, Gradignan, France), A.Morales, J.Morales, R.Nunez-Lagos, M.Plo.
Nuovo Cimento A (Italy), vol.74A, ser.2, no.1, p.28-36 (1 March 1983).
Results on the parity-nonconserving alpha width $\Gamma_{\alpha}^{\text{PNC}}$ of the ($J^{\pi}, T=0^{+}, 1$) $E_{\alpha}=4.753$ MeV level of ^{18}F are reported. This level is tentatively fed by the $^{18}\text{N}(\alpha,\gamma)^{18}\text{F}$ reaction and the absence of de-excitation γ -ray allows the authors to set an upper limit of $\Gamma_{\alpha}^{\text{PNC}}\leq 1.2\times 10^{-3}$ eV. (30 refs.)

24.00 NUCLEAR REACTIONS AND SCATTERING: GENERAL

24.10 NUCLEAR REACTION AND SCATTERING MODELS AND METHODS

60146 Atomic electrons in nuclear processes: attractive nuisance or useful telltale?. E.Merzbacher, J.M.Feagin.
Comments Nucl. & Part. Phys. (GB), vol.11, no.4, p.139-47 (1983).
In low-energy nuclear reactions, atomic electrons which are initially bound to one of the collision partners are not always inert bystanders. Atomic transitions carry information on reaction widths; conversely, nuclear excitation functions may show evidence of atomic satellites. Experimental and theoretical work is reviewed. (14 refs.)

60147 Comments on recent progress in few particle physics. I.Slaus ('Ruder Boskovic' Inst., Zagreb, Yugoslavia).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1128-31 (April 1983).
(1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Status of the present understanding of multiparticle reaction mechanism is summarized. The studies of the reaction $\text{D}(p,2p)n$ show that the mechanism can be very important even if not easily noticeable in a particular representation, e.g. even a deep minimum is understood as a destructive interference between neutron-proton and proton-proton quasifree scattering. Information about nuclear interaction derived from few particle studies is discussed. The correct neutron-neutron effective range parameters are those extracted from the $\text{D}(\pi^{-},\gamma)2n$ reaction. Values extracted from the $\text{D}(n,p)2n$ reaction are influenced by the three body force. Evidences for the three body force are summarized. (20 refs.)

60148 A finite algorithm for the R-matrix description of nuclear resonances. G.Pisent (Istituto di Fisica, Univ. di Padova, Padova, Italy).
Leit. Nuovo Cimento (Italy), vol.36, ser.2, no.14, p.461-6 (2 April 1983).
A central point in the R-matrix theory is to transform the problem of inverting a fundamental channel matrix into that of inverting a level matrix (whose dimensions were assumed to be smaller). A similar case has been treated recently by the author (see *ibid.*, vol.72, p.303, 1982) where the transformation was from a channel space to a smaller space spanned by the rank index of a separable nuclear potential. In that paper the suitable algebra was found, able to draw explicit matrix inversion, in a very general and convenient way. The present paper deals with application of that inversion technique to the R-matrix theory. (3 refs.)

60149 Time compound nucleus for high energy nuclear reactions. K.Izumo, H.Araseki (Dept. of Phys., Coll. of Sci. & Technol., Nihon Univ., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.1, p.158-70 (Jan. 1983).
A new compound nucleus, which the authors call a time compound nucleus, is introduced to analyze general features of high energy nuclear reactions. The compound nucleus resonates in a Lorentzian form as a function of time delay of reaction. Two time compound states characterized by time widths $\tau_1=9.6\times 10^{-24}$ sec and $\tau_2=2.0\times 10^{-23}$ sec are identified by the comparison with experimental angular-energy spectra of fragments of nuclear reactions. They estimate that the compound states consist of about 20 baryons. (14 refs.)

60150 Supermultiplet symmetry in nuclear reactions: application to $^3\text{He}(p,H)2p$ and $^6\text{He}(^3\text{H},^6\text{He})^6\text{Li}^*$. C.Wertz (Catholic Univ. of America, Washington, DC, USA).
Phys. Rev. C (USA), vol.27, no.4, p.1375-86 (April 1983).
A detailed analysis of the extension of the Barshay-Temmer theorem to reaction product pairs that are members of the same SU(4) multiplet (Wigner supermultiplet) is presented. Nonzero values of the total orbital angular momentum within fragments in the presence of residual spin orbit splitting is shown to destroy symmetry of the reaction products around 90° except in a sum rule sense. Departures from reaction symmetry are related to the SU(4) breaking parameter in the effective nucleon-nucleon potential and it is shown that the asymmetry should decrease with increasing A. A comparison of the $^3\text{He}(p,H)2p$ and $^6\text{Be}(^3\text{H},^6\text{He})^6\text{Li}$ angular distributions illustrates this point. Finally, a prediction is made for the ratio of analyzing powers for the $^6\text{He}+^6\text{Li}$ and $^6\text{He}+^6\text{Li}^*(3,56)$ final states. (18 refs.)

60151 Comparison of the Chandler-Gibson and the Baer, Kouri, Levin, and Tobocman many-body scattering formalisms. W.Tobocman (Phys. Dept., Case Western Res. Univ., Cleveland, OH, USA).
Phys. Rev. C (USA), vol.27, no.4, p.1405-14 (April 1983).
The Chandler-Gibson N-body scattering formalism is shown to be related to the one of Baer, Kouri, Levin, and Tobocman in that both are the result of selecting a set of Lippmann-Schwinger equations to serve as a set of simultaneous coupled integral equations for all the elements in a row or column of the transition operator matrix. The Baer, Kouri, Levin, and Tobocman choice has the advantage that the equations decouple on iteration to give a set of uncoupled connected kernel equations whereas the Chandler-Gibson choice has the advantage of coupling the partitions in a symmetrical manner. This might cause the Chandler-Gibson formalism to be less sensitive than the Baer, Kouri, Levin, and Tobocman formalism to truncations on the spectrum of allowed intermediate virtual states. The Chandler-Gibson formalism is shown to be consistent with unitarity provided the coupling scheme includes all open channels. An alternative method for introducing projectors into the Chandler-Gibson formalism is suggested as a method for generating connected

kernel equations. The Chandler-Gibson wave function equations are derived and compared with the coupled reaction channels equations. Finally, we show that like the Baer, Kouri, Levin, and Tobocman equations, the Chandler-Gibson equations decouple and, in fact, reduce to a single wave operator equation of particularly simple form. (18 refs.)

60152 Lee model field theory of three-nucleon system. M.Sawicki (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland).
Phys. Rev. C (USA), vol.27, no.4, p.1415-30 (April 1983).
The VNN sector of the nonstatic Lee model is investigated as a prototype of the three-nucleon pnn system, leading to an effective three-body Hamiltonian with a new kind of disconnected three-body force. The solution of the disconnectedness problem is presented in terms of modified Faddeev equations. The state vectors of the deuteron and triton are constructed and scattering amplitudes for reactions $n+p\rightarrow n+p$, $n+p\rightarrow n+n+\pi^{+}$, and $n+d\rightarrow n+d$ are derived. All effects of off-shell renormalization are included in a complete and consistent way. (25 refs.)

60153 Chew-Low model and the potential description of the πN interaction. M.G.Fuda (Dept. of Phys. & Astron., State Univ. of New York, Amherst, NY, USA).
Phys. Rev. C (USA), vol.27, no.4, p.1693-6 (April 1983).
The inverse scattering problem for the Chew-Low model is solved and the solution is used to construct three different forms for the off-shell πN T matrix. The three forms differ in their treatment of the nucleon pole and the crossing cut. One of the forms is shown to be equivalent to a separable potential model with an energy dependent strength. The analysis gives some insight into the question of the range of the πN interaction. (21 refs.)

60154 Nuclear structure effects in high momentum transfer reactions. F.Cannata (Istituto di Fisica, Univ. di Bologna, Bologna, Italy), J.-P.Dedonder, S.A.Gurvitz.
Phys. Rev. C (USA), vol.27, no.4, p.1697-709 (April 1983).
It is shown that, at large momentum transfers, one can extract nuclear structure information from the response (function) of the nucleus to an external scalar probe by factorizing the on-shell form factor associated to the struck nucleon. This result, derived both for elastic and inelastic scattering, arises from compensations between off-shell effects and exchange current effects generated by the (local) nucleon-nucleon interaction. The corrections to this on-shell factorization are in general found to be small at large momentum transfers. The role of the final state interaction in the nuclear transition form factor is then investigated and it is shown how one can, for instance, correct the orthogonality defect introduced by using a plane wave approximation for the struck nucleon. (19 refs.)

60155 Separable expansions for virtual states and resonances. S.K.Adhikari, A.C.Fonseca, L.Tomio (Dept. de Fisica, Univ. Federal de Pernambuco, Pe, Brazil).
Phys. Rev. C (USA), vol.27, no.4, p.1826-9 (April 1983).
Finite rank expansions for two- and three-body T matrices are analytically continued to the unphysical sheet of the complex energy plane associated with the lowest two-body scattering threshold in order to obtain the position and residue of the virtual state and resonance poles. The present method is applied to study the 1S_0 virtual state of two nucleons, the Efimov virtual states of three identical bosons, and the doublet virtual state of three nucleons. (11 refs.)

60156 Comment on 'scattering with absorptive interactions'. S.Joffily (Groupe de Phys. Nucleaire Theorique, Univ. Louis Pasteur, Strasbourg, France).
Phys. Rev. C (USA), vol.27, no.4, p.1830-1 (April 1983).
In a recently published paper, Cassing and collaborators (*ibid.*, vol.26, p.22, 1982) discussed the general tendencies of the motion of the complex poles of the S matrix of a complex potential with increasing absorption. In this comment it is pointed out that their conclusions are, in fact, model dependent and therefore are not valid for as wide a class of complex potentials as is suggested. Because of the model dependence of these conclusions, questions about the generalised Levinson's theorem proposed by these authors for complex interactions are raised. (6 refs.)

- 60157 Energy dependence versus angular momentum dependence of optical potentials. W.Bauhoff (Theoretische Kernphys., Univ. Hamburg, Hamburg, Germany). *Phys. Rev. C (USA)*, vol.27, no.4, p.1822-5 (April 1983).
An optical potential depending linearly on the energy is transformed into a phase-equivalent energy-independent potential which depends on the angular momentum via $l(l+1)$. The transformation is exact and can be performed explicitly for an arbitrary shape of the potential. It is illustrated for the case of a Woods-Saxon potential. (7 refs.)

24.30 RESONANCE REACTIONS AND SCATTERING

- 60158 On the normal modes of vibration in light deformed nuclei. F.Arickx, J.Broeckhove (Dienst Theoretische en Wiskundige Natuurkunde, Rijksuniv. Centrum, Antwerpen, Belgium), E.Caurier, E.Deumens, P.Van Leuven. *Nucl. Phys. A (Netherlands)*, vol.A398, no.3, p.467-75 (2 May 1983).
An analysis of generator coordinate method calculations on density vibrations in axially deformed light nuclei, demonstrates that the normal modes are harmonic vibrations parallel and orthogonal to the symmetry axis. (8 refs.)
- 60159 Investigation of isobaric analog resonances in ^{53}Mn . P.Kleinwächter, H.U.Gersch, H.Schobert (Zentralinst. für Kernforschung Rossendorf, Dresden, Germany). *Nucl. Phys. A (Netherlands)*, vol.A398, no.3, p.476-92 (2 May 1983).
The isobaric analog resonances in ^{53}Mn with different spins and parities are investigated by means of the $^{52}\text{Cr}(p, p')$, (p, p') , (p, p'') and (p, γ) reactions. Spectroscopic factors are derived and the experimental (p, γ) strengths are compared with theoretical single-particle estimations. (27 refs.)
- 60160 Resonant-state perturbation formalisms. W.J.Romo (Dept. of Phys., Carleton Univ., Ottawa, Canada). *Nucl. Phys. A (Netherlands)*, vol.A398, no.3, p.525-43 (2 May 1983).
Three different formalisms for determining bound-state, virtual-state, and resonant-state energies of a perturbed system are developed. Two of the formalisms are based on expansions of the unperturbed Green function in terms of bound-state, resonant-state and deformed-continuum-state contributions of the form developed by T. Berggren (1968). The third formalism is based on a Mittag-Leffler expansion of the unperturbed Green function. The three formalisms are compared and the relative merits of calculation schemes based on them are examined. (28 refs.)
- 60161 The possibility of measuring the nuclear correlation width via atomic electron spectroscopy. W.Koenig, K.W.McVoy, H.A.Weidenmüller (Max-Planck-Inst. für Kernphys., Heidelberg, Germany), P.Kienle. *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.279-83 (7 April 1983).
The correlation width Γ of the autocorrelation function of the nuclear scattering matrix, usually determined through the analysis of Ericson fluctuations of nuclear cross sections, manifests itself also in the spectra of atomic electrons ejected coherently prior to and after nuclear scattering. The authors propose to determine Γ from a coincidence measurement between nuclear reaction products and atomic electrons, a method which does not require a good energy resolution of the incident beam, and which would make it possible to measure Γ in a range of values not accessible before. 24.70 POLARIZATION IN REACTIONS AND SCATTERING

- 60163 Observation of parity nonconservation in the integrated γ spectrum from (n, γ) reactions in Cl, Br, Cd, Sn, and La nuclei. V.A.Vesna, E.A.Kolomenskii, V.M.Lobashov, V.A.Nazarenko, A.N.Pirozhkov, L.M.Smotritskii, Yu.V.Sobolev, N.A.Titov (B.P. Konstantinov Inst. of Nuclear Phys., Acad. of Sci., USSR). *JETP Lett. (USA)*, vol.36, no.5, p.209-12 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.5, p.169-72 (5 Sept. 1982). [received: April 1983]
A P -odd asymmetry has been observed in the emission of γ rays upon the capture of polarized thermal neutrons by Cl, Br, and La nuclei. A circular polarization of the γ rays has been observed during the capture of unpolarized neutrons by Cl, Br, Sn, and La nuclei. (9 refs.)
- 60164 Proton polarization in the photodisintegration of the deuteron at γ energies in the range 700-1100 MeV. A.S.Bratshevskii, A.A.Zybalov, S.P.Karasev, O.G.Konovalov, P.V.Sorokin, Yu.O.Storozhenko, A.E.Tenishev (Physicotech. Inst., Acad. of Sci., Ukrainian SSR). *JETP Lett. (USA)*, vol.36, no.5, p.216-18 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.5, p.174-6 (5 Sept. 1982). [received: April 1983]
The polarization of protons in the reaction $\gamma + d \rightarrow p + n$ has been measured for γ energies over the range 700-1100 MeV. The protons are observed to have a large polarization over this entire γ energy range. (6 refs.)
- 60165 Investigation of the three-nucleon system by pd elastic scattering with polarized protons and deuterons. W.Gruebler, V.König, P.A.Schmelzbach, F.Sperisen, B.Jenny, R.E.White (Lab. für Kernphys., ETH, Zurich, Switzerland), F.Seiler, H.W.Roser. *Nucl. Phys. A (Netherlands)*, vol.A398, no.3, p.445-66 (2 May 1983).
Angular distributions of cross section and analyzing power A_y of protons scattered on deuterium were measured between 8.5 and 22.7 MeV. For the corresponding energy of incident deuterons scattered from hydrogen, angular distributions of the deuteron vector and tensor analyzing powers A_y^d , A_{yy} and A_{xx} were measured at 6 energies between 17 and 45.4 MeV. The proton and deuteron data together with corresponding data at lower energies are analyzed in terms of Legendre polynomials. The energy dependence of the resulting coefficients are discussed. (18 refs.)
- 60166 Pion-exchange contributions to the Lobashov experiment. J.L.Friar (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), B.H.J.McKellar. *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.284-8 (7 April 1983).
The one-pion-exchange contributions to the Lobashov experiment (1972) are carefully calculated and are shown to be relativistic corrections. Their contribution to the circular polarization, P_n , is 1.1×10^{-9} A, where A measures the strength of the parity violating $\text{NN}\pi$ coupling. For $A=1$ this is approximately 10% of the usual nonrelativistic arising from heavy meson exchange. (12 refs.)
- 60167 Deformation effects in aligned ^6Li scattering. H.Nishioka, J.A.Tostevin, R.C.Johnson (Dept. of Phys., Univ. of Surrey, Guildford, England). *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.17-20 (21 April 1983).
A second rank tensor potential for ^6Li scattering is obtained within the framework of a single folding model by assuming an $\alpha+d$ cluster structure for ^6Li . The intercluster wavefunction contains D-state and S-state components with amplitudes chosen to reproduce the experimental value of the ^6Li Q -moment. Calculations are made for $^6\text{Li} + ^{58}\text{Ni}$ elastic scattering at $E_{\text{cm}} = 18.1$ MeV. The puzzling behaviour of the measured tensor analysing power (T_{20}) is reproduced. (16 refs.)

25.20 PHOTONUCLEAR REACTIONS AND PHOTON SCATTERING

60169 $^{113}\text{In}(\gamma, n)$ reaction isomeric and ground-state cross-sections. S.A.S.Vitiello, I.D.Goldman (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil). *Nuovo Cimento A (Italy)*, vol.74A, ser.2, no.1, p.17-27 (1 March 1983). The $^{113}\text{In}(\gamma, n)^{112}\text{In}^{\text{m}}$ reaction cross-sections were measured between 10 and 25 MeV. The measurements have been made by residual activity. A Lorentz line shape was fitted to the (γ, n) cross-section with $E_0 = (16.8 \pm 0.2)$ MeV, $\Gamma = (8.2 \pm 0.6)$ MeV and $\sigma_0 = (324 \pm 17)$ mb. The isomeric to ground-state ratio is approximately constant at a value of 2.5 with variations that do not exceed 10%. Theoretical calculations using the statistical model are consistent with the experimental data. (19 refs.)
60170 The photodisintegration of ^{40}Ar . R.A.Sutton, P.D.Allen, M.N.Thompson, E.G.Muirhead (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia). *Nucl. Phys. A (Netherlands)*, vol.A398, no.3, p.415-33 (2 May 1983). High resolution measurements of the (γ, n) , $(\gamma, 2n)$, (γ, p) , (γ, np) and $(\gamma, 2p)$ cross sections of ^{40}Ar over a photon energy range of 10 to 28 MeV are reported. From this data, the total photon absorption cross section integrated to 26 MeV is found to be 434 ± 40 MeV.mb. The results of a dynamic collective model (DCM) calculation compare favourably with the photoabsorption cross section, supporting the use of the DCM in this mass region. It is confirmed that isospin plays an important role in the decay of the ^{40}Ar giant dipole resonance. (53 refs.)

25.40 NUCLEON-INDUCED REACTIONS AND SCATTERING

(see also 28.20 Neutron physics)

60173 Nucleon-induced pion production on nucleons and nuclei. G.E.Walker. *Comments Nucl. & Part. Phys. (GB)*, vol.11, no.4, p.155-70 (1983). The current status of experiment and theory for the (p, π) reaction is discussed. (32 refs.)
60174 High resolution proton resonance measurements. G.E.Mitchell (North Carolina State Univ., Raleigh, NC, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1115-18 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). With present technology, nuclear densities restrict charged particle resonance studies to below mass $A=70$. Many of the most interesting materials engineering and solid state applications, as well as astrophysical questions, involve light nuclei. Good experimental resolution is crucial; for solid targets the author obtains an overall resolution of 300 eV. The author observes two main types of results. One is characteristic of the FP shell, with many small levels very close together. A contrasting pattern is usually observed in the sd shell, where the level density is much lower, and very broad states coexist with very narrow states. Just in this narrow energy region resonances with angular momentum and parity of $1/2^+$, $1/2^-$, $3/2^-$, $3/2^+$, $5/2^+$, $5/2^-$ and $7/2^-$ are observed, with widths ranging from 10 eV to 30000 eV. (20 refs.)
60175 Simultaneous measurements of analyzing powers and differential cross sections for $n+^{28}\text{Si}$. C.R.Howell, R.L.Walter (Dept. of Phys., Duke Univ., Durham, NC, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1132-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). Scattering experiments conducted with beams of polarized neutrons give special information about the spin sensitive part of the neutron-nucleus interaction. Carefully controlled measurements of the analyzing power $A(\theta)$ for the scattering of polarized neutron beams can also give accurate values for the more conventional observable, the differential cross section $\sigma(\theta)$. The paper focuses on an attempt to obtain $\sigma(\theta)$ values for $^{28}\text{Si}(n, p)$ from an experiment originally intended to determine only the function $A(\theta)$. As a test the data are compared to cross sections measured in a conventional neutron scattering experiment. (6 refs.)
60176 Comparison of the (p, xn) cross sections from ^{238}U , ^{235}U and ^{232}Th targets irradiated with 200 MeV protons. Y.Y.Chu, M.L.Zhou (Dept. of Chem., Brookhaven Nat. Lab., Upton, NY, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1153-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). The authors have measured absolute cross sections for (p, xn) reactions (x ranges from 0 to 8) from ^{238}U , ^{235}U , and ^{232}Th targets irradiated with 200 MeV protons at the Brookhaven AGS Linac injector. Chemical yields were determined by using ^{239}Np and ^{233}Pa as tracers. Yield patterns obtained in this work can be compared to the experimental results and theoretical calculations from earlier work and they are consistent within the framework of intranuclear cascade followed by neutron evaporation and fission competition. (20 refs.)
60177 Cyclotron production of ^{67}Ga . Cross sections and thick-target yields for the $^{67}\text{Zn}(p, n)$ and $^{68}\text{Zn}(p, 2n)$ reactions. F.E.Little, M.C.Lagunas-Solar (Crocketer Nuclear Lab., Univ. of California, Davis, CA, USA). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.3, p.631-7 (March 1983). Natural zinc foils were irradiated with ≥ 35 -MeV protons and cross sections were measured for the reactions $^{67}\text{Zn}(p, n)^{67}\text{Ga}$, $^{67}\text{Zn}(p, 2n)^{66}\text{Ga}$, $^{68}\text{Zn}(p, 2n)^{67}\text{Ga}$ and $^{68}\text{Zn}(p, 3n)^{66}\text{Ga}$. Thick-target yields as well as radiocontaminant ratios were calculated from the cross-section data. Targets were also irradiated under near production conditions and the yields were compared with calculated values. An alternative production method based upon the $^{67}\text{Zn}(p, n)^{67}\text{Ga}$ reaction was found to provide equivalent yields to those obtained from the $^{68}\text{Zn}(p, 2n)^{67}\text{Ga}$ reaction. The possibility of using double targets is also discussed. (16 refs.)
60178 Excited-state giant dipole resonances in (p, γ) : a new probe of single-particle strengths. D.H.Dowell, G.Feldman, K.A.Snover (Dept. of Phys., Univ. of Washington, Seattle, WA, USA), A.M.Sandorfi, M.T.Collins. *Phys. Rev. Lett. (USA)*, vol.50, no.16, p.1191-4 (18 April 1983). The (p, γ) reaction populating highly excited states in ^{28}Si is shown to be dominated by giant dipole resonances built upon one-particle, one-hole states. Each giant resonance is centered at $E_x \approx 20$ MeV, with a width which increases with the energy of the one-particle, one-hole state, and with a strength that is simply related to the proton stripping strength to the same final state. (13 refs.)
60179 Gamow-Teller strength in the $^{18}\text{O}(p, n)^{18}\text{F}$ reaction at 135 MeV. B.D.Anderson, A.Fazely, R.J.McCarthy, P.C.Tandy, J.W.Watson, R.Madey (Dept. of Phys., Kent State Univ., Kent, OH, USA), W.Bertozzi, T.N.Buti, J.M.Finn, J.Kelly, M.A.Kovash, B.Pugh, B.H.Wildenthal, C.C.Foster. *Phys. Rev. C (USA)*, vol.27, no.4, p.1387-93 (April 1983). The distribution of Gamow-Teller strength in the $^{18}\text{O}(p, n)^{18}\text{F}$ reaction was studied at a bombarding energy of 135 MeV. Five 1^+ , $T=0$ states are identified below $E_x=7$ MeV and a concentration of 1^+ states of presumed $T=1$ character is observed between $E_x=9.5$ and 12 MeV. Approximately 82% of the 1^+ strength is concentrated into the ground-state transition and only 5.5% is seen in the $T=1$ component. Normalization of the ground-state transition to the known Gamow-Teller matrix element from the analogous beta decay of ^{18}Ne allows the (p, n) cross sections to be related to the Gamow-Teller strength. The resulting total Gamow-Teller strength observed in the (p, n) reaction is about two-thirds of the minimum value required by the sum rule for a $T=1$ nucleus. This result is in reasonable agreement with the total Gamow-Teller strength predicted from a shell-model calculation which uses empirically renormalized single-particle Gamow-Teller matrix elements. The concentration of the $T=0$ strength predominantly into the ground state and the observed ratio of $T=1$ to $T=0$ strength also are consistent with these calculations. (24 refs.)
60180 Cross section calculations for nucleon- ^{40}Ca and α - ^{40}Ca elastic scattering from microscopic nonlocal optical potentials. H.Dermawan, F.Osterfeld (Inst. fur Kernphys., KFA Juelich, Juelich, Germany), V.A.Madsen. *Phys. Rev. C (USA)*, vol.27, no.4, p.1474-82 (April 1983). Microscopic calculations of the second-order optical potential are made for $^{40}\text{Ca}(n, n)$, $^{40}\text{Ca}(p, p)$, and $^{40}\text{Ca}(\alpha, \alpha)$ at various incident energies using random phase approximation transition densities for intermediate excited states. Elastic scattering cross sections are calculated from the microscopic nonlocal potentials and are compared with cross sections which have

been calculated from the equivalent local potentials. The validity of the local approximation to the nonlocal potentials is discussed. (29 refs.)

60181 Radiation proton trapping by ^{51}V , ^{59}Co , $^{63,65}\text{Cu}$ Nuclei. B.A.Nemashkalo, V.V.Voronov, V.E.Storizhko. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.332-8 (March 1983). In Russian. Radiation proton trapping by ^{51}V , ^{59}Co , $^{63,65}\text{Cu}$ nuclei at energies below 3.0 MeV was studied by the method of averaged resonances. The analysis was performed in terms of a statistical theory. (24 refs.)

25.50 ^2H - AND ^3H -INDUCED REACTIONS AND SCATTERING

60182 Special features of the alpha induced deuteron breakup. J.M.Lambert, P.A.Treado (Dept. of Phys., Georgetown Univ., Washington, DC, USA), I.Slaus, Y.Koike, F.D.Corrall, R.E.Brown, R.A.Hardekopf, N.Jarmie. *IEEE Trans. Nucl. Sci. (USA)*, vol.30, no.2, p.1146-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The alpha induced deuteron breakup reactions have been of interest since the nucleon induced deuteron breakup problem was addressed with tractable and predictive models based on the Faddeev formalism and with appropriate nucleon-nucleon forces. The authors discuss a few special features of the alpha induced deuteron breakup reactions. Specifically, they point out the importance of the n-p tensor force in the predictions of the three-body model that fit the tensor analyzing powers better and the concomitant deterioration of the fit to the vector analyzing power caused by the inclusion of the tensor force. They suggest that there exists evidence for the 1S_0 n-p interaction, which is isospin forbidden, in both the cross section and spin observables data. Finally, they discuss certain characteristics of the p- α quasifree-scattering and n- α final-state-interaction processes. (10 refs.)

60183 Bremsstrahlung in the ^3He - ^2H interaction near the deuteron break-up threshold. P.Bricault, R.J.Slobodrian, C.Rioux, L.Potvin, R.Roy, R.Larue (Dept. de Phys., Univ. Laval, Quebec, Canada), B.Frois. *J. Phys. (France)*, vol.44, no.4, p.461-5 (April 1983).

The nuclear bremsstrahlung cross-section in the ^3He - ^2H interaction in the neighbourhood of the deuteron break-up threshold has been measured for the first time at seven energies, via detection in the final state of the charged particles ^3He and ^2H at the correlation angles 33° - 24° . A comparison with theoretical calculations shows a systematic deviation, but statistics of the very small cross-sections are not sufficient to claim unambiguously a threshold effect. (9 refs.)

60184 Bare potential DWBA for (d, p) reactions. M.Ichimura (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan), M.Kawai. *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.128-41 (Jan. 1983).

Applicability of 'bare potential DWBA' (BPDWBA) to light ion induced transfer reactions is investigated. The reaction $^{16}\text{O}(d, p)^{17}\text{O}$ and $^{40}\text{Ca}(d, p)^{41}\text{Ca}$ at $E_d=10.5$ MeV are studied, for which coupled channel (CC) calculations exist. Search is made of the 'optical' potential which fit the CC results of (d, d) and (p, p) scatterings. The 'optical' potentials and/or the bare potentials (the distorting potentials in the CC equations) are used in DWBA calculations of (d, p) cross sections. Results of the various types of DWBA distinguished by the choice of the distorting potentials are compared with the CC results. It is found that none of such DWBAs reproduces the CC cross sections. Physical implications of these types of DWBA are discussed in detail. (18 refs.)

60185 Structure of ^{209}Bi deduced from the $^{208}\text{Pb}(t,2n\gamma)$ reaction. K.H.Maier (Hahn-Meitner Inst., Berlin, Germany), T.Nail, R.K.Sheline, W.Stoffl, J.A.Becker, J.B.Carson, R.G.Lanier, L.G.Mann, G.L.Struble, J.A.Cizewski, B.H.Erkila. *Phys. Rev. C (USA)*, vol.27, no.4, p.1431-53 (April 1983).

States in ^{209}Bi were populated with the $^{208}\text{Pb}(t,2n)$ reaction. Incident triton energies between 11 and 16 MeV were used. Gamma-ray excitation functions, angular distributions, and γ - γ -time coincidence spectra were measured. Approximately 50 newly-observed γ rays have been assigned to transitions in ^{209}Bi . Previously-unresolved doublets at $E_\gamma=2600$, 3135, and 3154 keV have been identified. A new level at 3270 keV is reported, and the 3197-keV level is verified. ^{209}Bi level energies are reported with an accuracy of 600 eV or less. A level scheme for $E_\gamma<4.14$ MeV is presented, including spin-parity assignments. A new M1 transition between the $5/2^+$ and $3/2^+$ members of the $\pi h_{9/2}\otimes 3^-$ septuplet is reported. The 19 levels belonging to the $\nu g_{7/2}p_{1/2}^{-1}$, $h_{9/2}$ are identified. (26 refs.)

25.60 ^3He - AND ^4He -INDUCED REACTIONS AND SCATTERING

60186 The production of neutron-rich nuclides in the heavy-element region via ^3He induced reactions. Y.Y.Chu, M.L.Zhou (Dept. of Chem., Brookhaven Nat. Lab., Upton, NY, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1149-52 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The authors have measured the production cross sections for ^{233}Th and ^{231}Th from the bombardment of ^{238}U with ^3He ions at 46-, 53-, and 60-MeV at the Brookhaven 60-in. isochronous cyclotron. They have also attempted to observe the decay of ^{233}Ac produced via $^{238}\text{U}(^3\text{He}, ^8\text{B})$ or equivalent reactions using 61 MeV ^3He ions by first separating thorium from actinium and then performing chemical purifications on the second thorium sample into which the actinium has decayed. In the four experiments they performed, three gave results consistent with the β half-life of ^{233}Ac somewhat longer than 120 s and the production cross section from this target-projectile combination in the order of 1-2 μb . (19 refs.)

60187 Continuous spectra of deuterons from $^3\text{He}+^{12}\text{C}$ at low energy. G.Calvi, M.Lattuada, C.Spitalen (Istituti di Fisica, Univ. di Catania, Italy), F.Riggi, D.Vinciguena, C.M.Sutera, A.Panteleo.

Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.14, p.475-80 (2 April 1983).

The simple spectator model for this reaction assumes that the detected particle is spectator of the process, thus retaining the velocity it had before the interaction. For instance a peak around $2/3 E_0$ is expected in the deuteron spectra, while the corresponding proton carries out the energy $1/3 E_0 - |B|$, $B=-5.5$ MeV being the binding energy of the proton in ^3He . This feature is commonly observed at incident energies much higher than the binding energy. However, when the ^3He incident energy is less than 16.5 MeV the proton cannot carry away the energy $1/3 E_0 - |B|$, so that the break-up process could show uninvestigated features in the continuous deuteron spectra. In order to study the importance of this mechanism a systematic study of the inclusive spectra of the reaction products from the interaction of ^3He ions with different target nuclei was undertaken. The authors report preliminary data about the contribution of the process on the ^{12}C nucleus. (9 refs.)

60188 Quasifree scattering at low energies in $^6\text{Li}(\alpha,2\alpha)^2\text{H}$. D.Gola, W.Bretfeld, W.Burgmer, H.Eichner, Ch.Heinrich, H.J.Helten, H.Kretzer, K.Prescher, H.Oswald, W.Schnorrenberg, H.Paetz gen. Schick (Inst. fur Kernphys., Univ. of Koln, Koln, Germany).

Phys. Rev. C (USA), vol.27, no.4, p.1394-400 (April 1983).

α - α quasifree scattering was investigated in the reaction $^6\text{Li}(\alpha,2\alpha)^2\text{H}$ as a function of energy of the incident α particles. In the energy range $E_\alpha=6.6$ to 13.0 MeV 51 spectra under kinematically complete conditions were obtained at symmetrical angles such that the spectator momentum $p_{\text{S1}}=0$. The widths and magnitudes of the spectator momentum distributions are strongly energy dependent. This dependence can be reproduced by a plane wave impulse approximation modified by a reflection coefficient calculated semiclassically in WKB approximation. (13 refs.)

60189 Role of the ^3He optical model potential ambiguity in the distorted-wave Born approximation description of the $^{58}\text{Ni}(^3\text{He},d)^{59}\text{Cu}$ reaction at 130 MeV incident energy. A.Djaloeis, C.Alderliesten, J.Bojowald, C.Mayer-Borikce, W.Oelert, P.Turek (Inst. fur Kernphys., KFA Julich, Julich, Germany).

Phys. Rev. C (USA), vol.27, no.4, p.1483-8 (April 1983).

Angular distributions of $^{58}\text{Ni}(^3\text{He},d)^{59}\text{Cu}$ transitions leading to the $(0.0 \text{ MeV}, 3/2^-)$, $(0.91 \text{ MeV}, 5/2^-)$, and $(3.04 \text{ MeV}, 7/2^+)$ states in ^{59}Cu have been measured at an incident energy of 130 MeV. The experimental data have been used to study mainly the role of the ^3He optical model potential ambiguity in the distorted-wave Born approximation description of the reaction. Satisfactory fits to the data are obtained using a deep helion potential in standard local zero-range calculations. For a shallow ^3He potential a comparable description can be achieved if the depth of the real part of the deuteron optical potential is reduced considerably, and nonlocality as well as finite-range corrections are taken into account. Under these conditions, the use of a ^3He potential constructed according to the Johnson-Soper prescription yields similar results. (25 refs.)

25.70 HEAVY ION INDUCED REACTIONS AND SCATTERING

60190 Heavy ion resonances in the s-d shell. G.Vourvopoulos (NRC Demokritos, Athens, Greece).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1119-23 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

In spite of the wealth of experimental information that exists on heavy ion resonances the theoretical interpretations proposed have been proven inadequate. One of the early arguments given for the observation of resonances in systems such as $^{12}\text{C}+^{12}\text{C}$ and $^{12}\text{C}+^{16}\text{O}$ has been the low level density of these systems. On the contrary, systems such as $^{16}\text{O}+^{16}\text{O}$ are characterized by a much higher level density and do not exhibit any structure. In this context, systems such as $^9\text{Be}+^{12}\text{C}$ and $^9\text{Be}+^{13}\text{C}$, having a level density comparable to that of $^{12}\text{C}+^{12}\text{C}$ should also exhibit resonant behavior. Two points are addressed: (a) the level density argument and (b) the α -like structure argument. The experimental investigation of the systems $^9\text{Be}+^{12}\text{C}$, $^9\text{Be}+^{13}\text{C}$,

$^{12}\text{C}+^{18}\text{O}$ and $^{16}\text{O}+^{14}\text{C}$ are presented leading to the discussion of the above arguments. Finally the correlation of the heavy ion resonances and those seen in light ion experiments is shown. (20 refs.)

60191 Microscopic study on di-nuclear states of $^{16}\text{O}+^{40}\text{Ca}$ and $^{40}\text{Ca}+^{40}\text{Ca}$. I. A. Tohsaki-Suzuki (Faculty of Textile Sci. & Technol., Shinshu Univ., Ueda, Japan), K. Ikeda. *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.113-27 (Jan. 1983). The di-nuclear states of $^{16}\text{O}+^{40}\text{Ca}$ and $^{40}\text{Ca}+^{40}\text{Ca}$ are studied from a microscopic point of view within a framework of the generator coordinate method (GCM). The GCM energy kernels including the Coulomb one are exactly treated up to high angular momenta. The states with di-nuclear configuration for the two systems are calculated under a bound state approximation. The following properties of the rotational bands are studied quantitatively: the number of possible bands, their band head energies and moments of inertia. The remarkable shell effects are found in the rotational spectra at high angular momentum nearly equal to that of the state forbidden by a shell model. The potential barriers are also evaluated. (8 refs.)

60192 A modified Glauber approximation and the formation of shock waves in high-energy heavy ion collisions. M. Iwasaki (Dept. of Phys., Kochi Univ., Kochi, Japan), S. Takagi. *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.142-57 (Jan. 1983). Coherent features in high energy heavy ion collisions are investigated from a microscopic viewpoint. A modified Glauber approximation which enables one to include the slowing down of the relative motion between the centers of masses of both nuclei is presented. The generation of the shock wave is shown to be suppressed by this slowing down effect. As an application, inclusive nucleon spectra and the two-particle correlation are calculated in the case of $\text{Ne}+\text{U}$ collision at 400 MeV/A. (8 refs.)

60193 Liquid-gas phase instabilities in nuclear systems. M.W. Curtin, H. Toki, D.K. Scott (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA). *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.289-92 (7 April 1983). The conventional approach to composite fragment production in heavy ion collisions from a single gaseous phase may require modification at temperatures below 20 MeV due to the onset of a liquid-gas phase instability. Clusters heavier than the α -particle are necessary for an unambiguous experimental signature. (14 refs.)

60194 Elastic breakup of 70 MeV ^7Li ions on lead. I.J. Thompson (Dept. of Theoretical Phys., Manchester Univ., Manchester, England), M.A. Nagarajan. *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.379-82 (14 April 1983). The breakup cross section, in the reaction of 70 MeV ^7Li ions on ^{208}Pb leaving the lead target in its ground state, is calculated in various approximations. It is shown that the prior form of DWBA as well as the high energy adiabatic approximation to the breakup amplitude yield cross sections which are much larger than the experimentally observed cross section. It is suggested that it is necessary to include non-adiabatic corrections, and that a more realistic approach to the Coulomb distortion of the projectile by the target nucleus is necessary. (10 refs.)

60195 Anomalous reaction mean free paths of nuclear projectile fragments from heavy ion collisions at 2A GeV. E.M. Friedlander, R.W. Gimpel, H.H. Heckman, Y.J. Karant (Lawrence Berkeley Lab., Univ. of California, CA, USA), B. Judek, E. Ganssauge. *Phys. Rev. C (USA)*, vol.27, no.4, p.1489-520 (April 1983). The authors present in detail the description and the analysis of two independent experiments using beams of ^{16}O and ^{36}Fe . From their results it is concluded that the reaction mean free paths of relativistic projectile fragments, $3 \leq Z \leq 26$, are shorter for a few centimeters after emission than at large distances, where they are compatible with values predicted from experiments on beam nuclei. The probability that this effect is due to a statistical fluctuation is $<10^{-3}$. The effect is enhanced in later generations of fragments, the correlation between successive generations suggesting a kind of 'memory' for the anomaly. Various systematic and spurious effects as well as conventional explanations are discussed, mainly on the basis of direct experimental observations internal to our data, and found not to explain our results. The data can be interpreted by the relatively rare occurrence of anomalous fragments that interact with an unexpectedly large cross section. The statistical methods used in the analysis of the observations are fully described. (30 refs.)

60196 Giant resonance excitation in the $^{27}\text{Al}(^6\text{Li},^4\text{He})^{27}\text{Si}$ reaction at 93 MeV. A. Guterman, G. Ciangaru, C.C. Chang, J.D. Siik (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA), D.L. Hendrie, T.J.M. Symons, J. Mahoney. *Phys. Rev. C (USA)*, vol.27, no.4, p.1521-5 (April 1983). A giant resonance in ^{27}Si is observed in the excitation energy region of 10-18 MeV in the spin-isospin flip $^{27}\text{Al}(^6\text{Li},^4\text{He})^{27}\text{Si}$ reaction. A microscopic distorted-wave Born approximation analysis using a G-matrix nucleon-nucleon force and a local energy approximation knockout exchange correction indicates multipolarities between $\lambda=3$ and $\lambda=5$ for the giant resonance. (15 refs.)

60197 Quadrupole effects in ^7Li scattering at 88 MeV. J. Cook, M.F. Vineyard, K.W. Kemper (Dept. of Phys., Florida State Univ., Tallahassee, FL, USA), V. Hnizdo. *Phys. Rev. C (USA)*, vol.27, no.4, p.1536-9 (April 1983). Calculations for ^7Li elastic scattering at 88 MeV have been made explicitly including a quadrupole term in the optical potential resulting from folding of an effective nucleon-nucleon interaction with the quadrupole deformation of ^7Li . Data for ^{40}Ca could be fitted without a renormalization of the folded potential, but this was not possible for lighter targets which required a renormalization of about 0.6 even when the quadrupole potential was included. (18 refs.)

60198 $^{12}\text{C}(^{16}\text{O},\alpha)^{24}\text{Mg}^*$ reaction in the energy region $E_{\text{cm}}=26.6$ to 42.9 MeV. M.J. Bechara, A.J. Lazzarini, R.J. Ledoux, E.R. Cosman (Dept. of Phys., MIT, Cambridge, MA, USA). *Phys. Rev. C (USA)*, vol.27, no.4, p.1540-9 (April 1983). The $^{12}\text{C}+^{16}\text{O}$ resonance structure in the ^{28}Si nucleus is examined by means of the $^{12}\text{C}(^{16}\text{O},\alpha)^{24}\text{Mg}$ reaction excitation functions in the energy range $E_{\text{cm}}=26.6$ to 42.9 MeV in 430 keV steps at $\theta_{\text{lab}}=7.5^\circ$. The authors could identify 64 discrete states in ^{24}Mg up to 31.7 MeV of excitation energy. The excitation functions show abundant structure over the entire energy range. The summed excitation functions, which tend to average out statistical fluctuations, show pronounced intermediate structure enhancement in the cross section at $E_{\text{cm}} \approx 29.5, 32.2$, and 35 MeV and indicate the presence of a smaller peak at 37.3 MeV. The widths of these structures are about 1 MeV, which is intermediate between the value expected from ion-ion potential resonances and statistical fluctuations. The nonstatistical character of these structures is reinforced by some statistical tests and by the correlations in energy and width found in several exit channels. The data also suggest a possible

structural relationship between the ^{28}Si resonances and certain ^{24}Mg final states. (27 refs.)

60199 Structure in the $^{12}\text{C}+^{12}\text{C}$ and $^8\text{Be}+^{16}\text{O}$ fission width distribution of ^{24}Mg observed via the reaction $^{12}\text{C}(^{16}\text{O},\alpha)^{24}\text{Mg} \rightarrow X+Y$. A.J. Lazzarini, S.G. Steadman, R.J. Ledoux, A. Sperduto, G.R. Young, K. Van Bibber, E.R. Cosman (Dept. of Phys., MIT, Cambridge, MA, USA). *Phys. Rev. C (USA)*, vol.27, no.4, p.1550-60 (April 1983). Prominent gross and intermediate width structures are observed in the $^{12}\text{C}+^{12}\text{C}$, $^{12}\text{C}+^{12}\text{C}^*(2^+)$, $^{12}\text{C}^*(2^+)+^{12}\text{C}^*(2^+)$, $^8\text{Be}+^{16}\text{O}$, and $^8\text{Be}+^{16}\text{O}^*$ ($3^-, 0^+$) decay channels following $^{24}\text{Mg}^*$ population via the $^{12}\text{C}(^{16}\text{O},\alpha)^{24}\text{Mg}$ reaction at $E_{\text{cm}}=33$ MeV. Evidence that the $^{12}\text{C}(^{16}\text{O},\alpha)^{24}\text{Mg}$ reaction populates states in ^{24}Mg which are associated with $^{12}\text{C}+^{12}\text{C}$ resonances is presented in the form of correlation analyses between the $\alpha+^{12}\text{C}+^{12}\text{C}$ three-body spectra and previously measured $^{12}\text{C}+^{12}\text{C}$ elastic and inelastic excitation functions. Direct determination of $^{12}\text{C}+^{12}\text{C}$ widths from these measurements is obscured by a background of other strong transitions which appear to be present in the $^{12}\text{C}(^{16}\text{O},\alpha)^{24}\text{Mg}$ singles spectrum. (30 refs.)

60200 Fusion cross sections for $^9\text{Be}+^{40}\text{Ca}$. J.S. Eck, A.R. Omar (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA), J.R. Leigh, T.R. Ophel. *Phys. Rev. C (USA)*, vol.27, no.4, p.1807-10 (April 1983). The total fusion cross sections for $^9\text{Be}+^{40}\text{Ca}$ were measured in the ^9Be bombarding energy range 35-60 MeV in 5 MeV steps by detecting the evaporation residues with a gas ionisation $E-\Delta E$ detector. The measured fusion cross sections are significantly smaller than the total reaction cross sections calculated using optical model parameters obtained from fitting the elastic scattering cross sections in the same energy range. Similar results were obtained earlier for the case of $^9\text{Be}+^{28}\text{Si}$ fusion. The fact that ^9Be is weakly bound and is easily dissociated in the Coulomb and nuclear fields of either the ^{40}Ca or ^{28}Si nucleus is believed to have a strong influence on the observed fusion and elastic scattering cross sections. Sources of possible discrepancy between fusion cross sections measured by determining the yield of heavy evaporation residues and those by summing the cross sections for the emission of light particles such as protons, neutrons, and alpha particles from the compound system are discussed. (10 refs.)

60201 Search for resonant behaviour in $^{16}\text{O}+^{24}\text{Mg}$ inelastic scattering. B.R. Fulton, J.S. Lilley (Daresbury Lab., Sci. & Engng. Res. Council, Warrington, England), T.M. Cormier, P.M. Stwertka. *Phys. Rev. C (USA)*, vol.27, no.4, p.1811-14 (April 1983). A search has been made for indications of resonant behaviour in forward angle ($20^\circ < \theta_{\text{lab}} < 40^\circ$) $^{16}\text{O}+^{24}\text{Mg}$ inelastic scattering. No evidence of resonant structure has been observed over the bombarding energy range 25 MeV $< E_{\text{cm}} < 39$ MeV. An upper limit for the reduced partial width in the $^{24}\text{Mg}(2^+, \pi^+)+^{16}\text{O}$ channel is deduced. (11 refs.)

25.80 MESON- AND HYPERON-INDUCED REACTIONS AND SCATTERING

60202 Observation of analog and nonanalog transitions in the reaction $^{56}\text{Fe}(\pi^+, \pi^-)^{56}\text{Ni}$. P.A. Seidl, R.R. Kiziah, M.K. Brown, C.F. Moore (Univ. of Texas, Austin, TX, USA), C.L. Morris, H. Baer, S.J. Greene, G.R. Burleson, W.B. Cottingham, L.C. Bland, R. Gilman, H.T. Fortune. *Phys. Rev. Lett. (USA)*, vol.50, no.15, p.1106-9 (11 April 1983). An excitation function for the reaction $^{56}\text{Fe}(\pi^+, \pi^-)^{56}\text{Ni}$ has been measured at $\theta_{\text{lab}}=5^\circ$ for incident pion energies of 140-290 MeV. The transition to the lowest-lying $T=0$ state is similar to previous observations, but that to the lowest-lying $T=2$ state is not, except in the high-energy range. (15 refs.)

60203 Observation of a quasideuteron component in the reaction $^{12}\text{C}(\pi^+, 2p)$. A. Altman, E. Pisetzky, J. Lichtenstadt, A.Y. Yavin (Dept. of Phys., Tel Aviv Univ., Tel Aviv, Israel), D. Ashery, R.J. Powers, W. Bertl, L. Felawka, H.K. Walter, R.G. Winter, J. van der Pluym. *Phys. Rev. Lett. (USA)*, vol.50, no.16, p.1187-90 (18 April 1983). The reaction $^{12}\text{C}(\pi^+, 2p)$ was studied at 165 and 245 MeV over a broad kinematic range by coincidence measurement of the outgoing protons. The p - p angular correlations and proton energy spectra allow an identification of the 'quasideuteron' component of the reaction. The angular distribution of this component has a shape similar to that of the $\pi^+d \rightarrow pp$ reaction. It is found that one-step quasideuteron absorption accounts for at most 25% of the total absorption cross section. (14 refs.)

60204 Observation of the nuclear isovector monopole resonance. J.D. Bowman, H.W. Baer, R. Bolton, M.D. Cooper, F.H. Cverna, N.S.P. King, M. Leitch, H.S. Matis (Los Alamos Nat. Lab., Los Alamos, NM, USA), A. Erell, J. Alster, A. Doron, M.A. Moinester, E. Blackmore, E.R. Siciliano. *Phys. Rev. Lett. (USA)*, vol.50, no.16, p.1195-8 (18 April 1983). Observation of the $T=1$ component of the isovector monopole and the giant dipole resonances in the reactions ^{90}Zr and $^{120}\text{Sn}(\pi^-, \pi^0)$ at $T_{\pi^-}=165$ MeV is reported. The isobaric analog state and $T=1$ component of the giant dipole resonance in the reaction $^{120}\text{Sn}(\pi^+, \pi^0)$ were also observed. Excitation energies and widths of the monopole are given. (12 refs.)

60205 Single and double scattering contributions to K^+ -deuteron vector analyzing power at 1.5 GeV/c. K. Hashimoto (Dept. of Phys., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA). *Phys. Rev. C (USA)*, vol.27, no.4, p.1572-7 (April 1983). The vector analyzing power for $\text{K}^+ ^2\text{H}$ elastic scattering at 1.5 GeV/c is predicted based on the Glauber model. The calculation, including the single and double KN scattering processes, uses the KN amplitudes obtained by an original phase-shift analysis. Results are also compared with those calculated by another KN analysis. It is shown that the deuteron analyzing power is sensitive to the structure of the KN amplitudes and is strongly affected by the KN polarization. (22 refs.)

60206 Quasielastic scattering of pions from ^{16}O at energies around the $\Delta(1232)$ resonance. C.H.Q. Ingram (Schweizerisches Inst. für Nuklearforschung, Villigen, Switzerland), P.A.M. Gram, J. Jansen, R.E. Mischke, J. Zichy, J. Bolger, E.T. Boschitz, G. Probst, J. Arvieux. *Phys. Rev. C (USA)*, vol.27, no.4, p.1578-601 (April 1983). Inelastic pion scattering from ^{16}O has been studied by measuring the spectrum of pions down to 40 MeV at five angles between 30° and 134° for three incident pion energies: 114, 163, and 240 MeV. The spectra are dominated by a broad peak due to quasielastic scattering from a single nucleon in the nucleus. The systematics of the spectra are discussed with emphasis on the pion-nucleus interaction dynamics including the effect of absorption. The partial $\pi^+{}^{16}\text{O}$ cross sections for all nonradiative channels are estimated. (36 refs.)

60207 Diffraction theory and the double-charge-exchange reaction $^{18}\text{O}(\pi^+, \pi^-)^{18}\text{Ne}$. L.C. Liu (Los Alamos Nat. Lab., Los Alamos, NM, USA). *Phys. Rev. C (USA)*, vol.27, no.4, p.1611-20 (April 1983). The angular distribution and the excitation function of the reaction $^{18}\text{O}(\pi^+, \pi^-)^{18}\text{Ne}$ (double isobaric analog state) can be well understood in the framework of a coupled-channel diffractive scattering theory provided higher-order processes are included. Use of a scaling theory allows an essentially parameter-free calculation of these processes and makes possible the study of effects arising from finer aspects of nuclear structure such as the core excitation of ^{18}O . (22 refs.)

60208 Spin flip transitions in ^{13}C and ^{19}F probed with the (π^-, γ) reaction. C.J. Martoff, J.A. Bistirlich, C.W. Clawson, K.M. Crowe, M. Koike, J.P. Miller, S.S. Rosenblum, W.A. Zajc (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), H.W. Baer, A.H. Wapstra, G. Strassner, P. Truol. *Phys. Rev. C (USA)*, vol.27, no.4, p.1621-35 (April 1983).

Photon spectra from radiative capture of stopped negative pions captured by ^{13}C and ^{19}F nuclei have been measured with a high resolution pair spectrometer. In the bound region transitions have been observed to $^{13}\text{B}(\text{g.s.})$, $^{13}\text{C}(3.5 \text{ MeV})$, $^{19}\text{O}(\text{g.s.})$, $^{19}\text{O}(4.9 \text{ MeV})$, and $^{19}\text{O}(6.3 \text{ MeV})$. In addition, strong transitions to narrow states above the neutron separation threshold were observed in both cases. The results for ^{13}C are in agreement with detailed shell model calculations of this process. Major strength is observed for states formed by coupling extra nucleons or holes to the spin-quadrupole $d_{5/2}$ and $d_{3/2}$, $J^\pi = 2^-$ states in ^{16}O . The $^{13}\text{C}(\pi^-, \gamma)^{13}\text{B}_{\text{g.s.}}$ branching ratio is shown to be consistent with beta decay and electroexcitation data, through a combined phenomenological analysis. The observed transition strengths are accounted for by matrix elements of the spin-density operators $[\sigma \times Y_0]_1^{1+}$ and $[\sigma \times Y_1]_1^{1+}$. (42 refs.)

60209 Stretched excitations and the spin-dependent part of the pion-nucleon interaction. J.A. Carr, F. Petrovich, D. Halderon (Dept. of Phys., Florida State Univ., Tallahassee, FL, USA), D.B. Holtkamp, W.B. Cottingham. *Phys. Rev. C (USA)*, vol.27, no.4, p.1636-41 (April 1983).

The p -wave form of the spin-orbit operator provides the basis for a single scattering model for the excitation of unnatural parity levels in pion-nucleon scattering in the region of the Δ resonance. The model is found to give a reasonable description of the π^+ and π^- experimental cross sections for the excitation of stretched 4^- and 6^- states in ^{16}O and ^{28}Si . In the calculations the interaction strength was fixed from the free pion-nucleon data and the spin transition densities were determined from recent (e, e') and (p, p') data. A schematic discussion of possible corrections to the model is also presented. (36 refs.)

60210 Bound states in the pion-nucleus velocity-dependent potential. J.F. Carinena, J. Sesma (Dept. de Física Teórica, Facultad de Ciencias, Zaragoza, Spain).

Phys. Rev. C (USA), vol.27, no.4, p.1642-6 (April 1983). The possibility of bound states in a velocity-dependent potential of the Kisslinger type, such as that used to describe the low-energy pion-nucleus interaction, is discussed. It is shown in a specific example that, for a real potential, the number of bound states is finite and their binding energies are real, in contradiction with general results claimed by other authors. (12 refs.)

60211 Pion single and double charge exchange in the resonance region: dynamical corrections. M.B. Johnson (Los Alamos Nat. Lab., Los Alamos, NM, USA), E.R. Siciliano.

Phys. Rev. C (USA), vol.27, no.4, p.1647-68 (April 1983). The authors consider pion-nucleus elastic scattering and single- and double-charge-exchange scattering to isobaric analog states near the $(3,3)$ resonance within an isospin invariant framework. They extend previous theories by introducing terms into the optical potential U that are quadratic in density and consistent with isospin invariance of the strong interaction. They study the sensitivity of single and double charge exchange angular distributions to parameters of the second-order potential both numerically, by integrating the Klein-Gordon equation, and analytically, by using semiclassical approximations that explicate the dependence of the exact numerical results to the parameters of U . The magnitude and shape of double charge exchange angular distributions are more sensitive to the isosensor term in U than has been hitherto appreciated. An examination of recent experimental data shows that puzzles in the shape of the $^{18}\text{O}(\pi^+, \pi^-)^{18}\text{Ne}$ angular distribution at 164 MeV and in the A dependence of the forward double charge exchange scattering on ^{18}O , ^{26}Mg , ^{42}Ca , and ^{48}Ca at the same energy may be resolved by adding an isosensor term in U . (38 refs.)

60212 Q -value systematics applied to the absorption of mesons on complex nuclei. H. Oeschler, Y. Cassagnou, R. Fonte, R. Legrain (Dept. de Phys. Nucleaire, CENS, Gif-sur-Yvette, France).

Phys. Rev. C (USA), vol.27, no.4, p.1677-84 (April 1983). The isotopic yields both from deep inelastic collisions between heavy ions and from fragmentation processes have been successfully described by Q -value systematics. In order to test their range of validity and to investigate correlations with specific reaction mechanisms, the Q -value systematics have been applied to the multinucleon-removal spectra following pion and kaon absorption on complex nuclei. Indeed, the isotopic distribution derived from these spectra shows the following feature: most of the yields are not strongly influenced by the charge of the pion and can be explained by nuclear evaporation following pion absorption. In contrast, the yields of elements far removed from the target show a better agreement with a Q_{res} law under the assumption that the pion is implanted in the target. The influence of the pion charge upon the yield distribution is thus evidenced even after the removal of 10-14 nucleons from the target. As a dominant evaporation process would not reproduce this effect, this indicates the importance of direct reaction mechanisms associated with pion absorption. This could support the hypothesis of an absorption on a complex cluster or a very strong final-state interaction. The parameter T extracted from the Q -value systematics appears proportional to the total energy brought by the meson into the system. (22 refs.)

60213 Reaction $\pi^+ + d \rightarrow p + p$ at 65 to 140 MeV. B.G. Ritchie, G.S. Blaupied, R.S. Moore, B.M. Preadom (Univ. of South Carolina, Columbia, SC, USA), K. Goto, R.C. Minehart, J. Boswell, G. Das, H.J. Ziock, N.S. Chant, P.G. Roos, W.J. Burger, S. Gilad, R.P. Redwine. *Phys. Rev. C (USA)*, vol.27, no.4, p.1685-92 (April 1983).

Differential cross sections for the reaction $\pi^+ + d \rightarrow p + p$ were measured for pion laboratory energies of 65, 72.5, 80, 95, 110, 125, and 140 MeV. The integrated cross sections for these energies were found to be 7.51 ± 0.19 , 7.91 ± 0.16 , 8.64 ± 0.15 , 9.61 ± 0.15 , 11.3 ± 0.2 , 11.7 ± 0.3 , and 11.3 ± 0.3 mb, respectively. These values indicate that the centroid and width of the energy dependence for the resonance in this reaction is lower and greater, respectively, than predicted by most theoretical models of the process. Comparisons made with predictions by Blankleider and Afnan show a qualitative difference between experimental measurements and calculations of the $P_2(\cos\theta)$ term in the polynomial expansion of the differential cross section. This may indicate a more important role for p -like exchange in the reaction mechanism than that included by the calculations. (14 refs.)

25.85 FISSION REACTIONS

60214 Role of accelerators in uniform identification of thermal neutrons. K. Denno (Dept. Electrical Engng., N.J. Inst. of Technol., Newark, NJ, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1173-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Control of nuclear reactors power output is centrally dependent on the level response of thermal neutrons flux as well as on their dynamic and kinetic spectra. The paper presents a set of uniform parametric properties for delayed neutrons based on accelerator experiments. Calculations have established several patterns linking energies of accelerated incident neutrons with respect to continuous spectra of delayed neutrons, mean yield of neutrons per fission, time response of neutron lethargy and energy spectra and delayed neutrons. Also mathematical models are developed for neutrons yield and spectra in the time domain with respect to ^{235}U and Pu^{239} material targets. Results obtained are important in accelerator selectivity application as well as in the planned control of nuclear thermal reactors, for ensuring adequate compatibility between power level and reactor reactivity trajectories. (5 refs.)

25.88 FUSION REACTIONS

60215 Nuclear reactions among the hydrogen isotopes at low energies. R.E. Brown, N. Jarmie, R.A. Hardekopf (Los Alamos Nat. Lab., Los Alamos, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1164-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The low-energy fusion cross-section (LEFCS) apparatus installed at the Los Alamos Van de Graaff facility has been used to measure the cross sections for the important fusion-energy reaction $\text{D}(t, \alpha)n$ over the triton bombarding energy range of 12.5 to 117 keV. This corresponds to an equivalent deuteron bombarding energy range of 8.3 to 78.1 keV and to a $\text{D}+\text{T}$ plasma temperature (kT) range of 0.7 to 18.8 keV. Over most of the energy range the cross sections are accurate to 1.4%, with the error rising to 4.8% at the lowest energy. A data base was constructed for deuteron bombarding energies up to about 250 keV that included the authors' data and four other data sets. This data base can be fitted quite well with a single-level $(3/2^+)$ resonance formula in the R-matrix formalism. (17 refs.)

60216 Quantized ATDHF calculations for subbarrier fusion of heavy ions. K. Goeke, F. Grummer (Inst. für Kernphys., KFA, Jülich, Jülich, Germany), P.-G. Reinhard.

Phys. Lett. B (Netherlands), vol.124B, no.1-2, p.21-5 (21 April 1983). The quantized adiabatic time-dependent Hartree-Fock theory (quantized ATDHF) is applied to the subbarrier fusion process of $^{16}\text{O} + ^{16}\text{O} \rightarrow ^{32}\text{S}$. The corresponding optimal, i.e. maximally decoupled collective path is evaluated by means of three-dimensional coordinate and momentum space grid techniques using the Bonche-Koonin-Negele interaction completed by the Coulomb force. Collective mass parameters, potentials, quantum corrections and rotational moments of inertia are evaluated in dependence of the distance between the ions. The results are compared to experimental fusion data and to the outcome of Hartree-Fock with quadrupole constraint. (23 refs.)

28.41 FISSION REACTOR THEORY AND DESIGN

- 60218 Pressure testing the THTR-300 reactor pressure vessel. F. Bremer, J. Schoning (Krupp GmbH, Essen, Germany). *Atomwirtsch.-Atomtech. (Germany)*, vol.28, no.4, p.189-92 (April 1983). In German.

The pressure and leak test successfully passed by the reactor pressure vessel of the THTR-300 high temperature reactor in the last week in September of 1982 has been a decisive step towards commissioning this prototype nuclear power plant, which is being built by the consortium of Brown, Boveri & Cie. AG (BBC), Hochttemperatur-Reaktorbau GmbH (HRB), and Nukem GmbH on behalf of Hochttemperatur-Kernkraftwerk GmbH (HKG). The fuels to be used in the reactor are uranium and thorium. The prestressed concrete vessel of the THTR-300 is shaped like an upright cylinder of 28 m height and 25 m diameter. The thickness of the walls and the bottom is approx. 5 m. The vessel concept is based on the experience of twenty years of international development; it represents a mature design. Problem-free construction and flexible design principles make for short construction times. The computer programs and confirmed materials data employed in the THTR vessel constitute a sufficiently sound basis for dimensioning prestressed concrete pressure vessels of different geometries for power plants up to the largest unit power sizes. (no refs.)

- 60219 Computer codes for system reliability engineering. P. Skvarka (Vyskumny ustav Energeticky, Pobocka, Bratislava, Czechoslovakia). *Jad. Energ. (Czechoslovakia)*, vol.29, no.3, p.103-5 (March 1983). In Czech. Present day state of computer programs for system reliability engineering in the world and codes used in design and research in nuclear engineering in Czechoslovakia are reviewed as well as the classification of computer codes by their purpose. (43 refs.)

- 60220 Generation and benchmark test of 26-group constant set for fast reactor calculations. Jung-Do Kim, Jong Tai Lee (Korea Advanced Energy Res. Inst., Seoul, Korea). *J. Korean Nucl. Soc.*, vol.14, no.4, p.163-71 (Dec. 1982). [received: April 1983]

An ABBN-type 26-group constant set, KAERI=26G, which can be reliably applied to fast reactor calculations has been generated using the nuclear data of ENDF/B-IV or ENDF-78 and a processing code ETOX-K4. The KAERI-26G set was evaluated by analysing measured integral quantities such as the effective multiplication factor, central reaction-rate ratio, and central reactivity coefficient for a variety of critical assemblies, and these calculated quantities were compared with results from other workers using similar type sets. (20 refs.)

- 60221 A finite element solution to the group diffusion problems with albedo-type boundary conditions. Kun Joong Yoo (Korea Advanced Energy Res. Inst., Seoul, Korea), Chang Hyo Kim, Chang Hyun Chung. *J. Korean Nucl. Soc.*, vol.14, no.4, p.178-85 (Dec. 1982). [received: April 1983]

An albedo-type boundary condition is incorporated into the finite element formulation of the cubic Hermite polynomials for the two-dimensional solution of the two-group diffusion problem. Two modifications are introduced with respect to the conventional expression for the weak form of the group diffusion equation with the zero flux of zero current boundary condition and the cubic element functions over the boundary nodes. The finite element formulations obtained from those modifications are tested with the two-dimensional ZION problem. The numerical effectiveness of the modifications is examined. (4 refs.)

- 60222 Review and application of the TRAC-PD2 computer code. R.K.-C. Chan, P.J. Masiello. *Report EPRI-NP-2826*, Electr. Power Res. Inst., Palo Alto, CA, USA (Jan. 1983). 128 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. A review is presented of the theoretical modeling and numerical methods and solution techniques used in the TRAC-PIA and TRAC-PD2 computer codes. Results that correspond primarily with TRAC-PD2 are reported: (1) an analysis of the numerical selection techniques used in the codes, (2) a review of the constitutive relations used in thermal-hydraulic models and (3) a comparison of code results with experimental data from various reflood and small-break tests.

- 60223 Feasibility study: A new cable tray hanger connector for nuclear power plants. M.W. Dixon, B.K. Pearce, J.E. Jackson, F.R. Bourne. *Report EPRI-NP-2910*, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983). 120 pp.
- Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Describes a feasibility study on the potential use of flexible connectors to reduce seismically induced loads in nuclear power plants. Finite element, classical analytic, and experimental examinations are detailed. Although it was concluded that a flexible connector system can provide a better dynamic

response than the conventional-type system using rigid connectors, additional work is required before this concept can be validated in actual plant designs.

- 60224 Comparison of COMETHE-IIIJ and FCODE-BETA fission gas release predictions with measurements. S. Lee, L. Rayces, E. Rumble, D. Wheeler, A. Woods. *Report EPRI-NP-2903*, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983). 72 pp.
- Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Compares the fission product gas release (FGR) predictability of two LWR fuel rod modeling codes: COMETHE-IIIJ and FCODE-BETA. The comparison is made using 124 all-characterized fuel rods with FGR measurements in the EPRI fuel performance data base.

28.42 FISSION REACTOR MATERIALS

- 60225 Experience with LOMI agents in cleaning cooling systems. H. Cole (AERE, Harwell, England). *Atomwirtsch.-Atomtech. (Germany)*, vol.28, no.1, p.26-8 (Jan. 1983). In German.

Research has revealed the corrosion products most frequently encountered in contaminated cooling water to be oxide compounds. It has been the practice for many years, both in nuclear and nonnuclear facilities, to remove oxide deposits by flushing with concentrated oxidants and chelating agents followed by citrates. Though very effective, these methods suffer from the drawback, especially in nuclear plants, of requiring huge amounts of flushing water, thus producing enormous volumes of liquid radioactive effluents. Ideally, decontaminants should have low agent concentrations and dissolve oxides fast in order for their presence not to cause further corrosion. Studies of the problems associated with the decontamination of reactor cooling water in Britain focused on improvements of the rate of dissolution, with the conclusion that the simplest way to achieve this would be by modifying the chemical structure of the oxide. (no refs.)

- 60226 Measures for increasing IAEA safeguards effectiveness. C.R. Hatcher (Los Alamos Nat. Lab., Los Alamos, NM, USA). *J. Inst. Nucl. Mater. Manage. (USA)*, vol.11, no.4, p.22-8 (Winter 1982).

The effectiveness of International Atomic Energy Agency (IAEA) safeguards depends not only on the quality of IAEA inspection and independent verification of declared nuclear material and facility use, but also on the perception of and reaction to IAEA safeguards by the nations who make up the international community. Because perceptions and reactions often involve nontechnical as well as technical factors, it has proven difficult to describe IAEA safeguards effectiveness in quantitative technical terms. This study uses a flow diagram to examine how IAEA inspections and the resulting verification statements lead to the main political objectives of IAEA safeguards, assurance and deterrence. Based on this approach, a figure of merit called the IAEA safeguards effectiveness ratio is defined, and measures for increasing IAEA safeguards effectiveness are identified and discussed. (14 refs.)

- 60227 Anticipated amounts of nuclear materials under IAEA safeguards (1981-1990). A. Bilyk (International Atomic Energy Agency, Vienna, Austria). *J. Inst. Nucl. Mater. Manage. (USA)*, vol.11, no.4, p.29-33 (Winter 1982).

To assess the scope of nuclear activities subject to safeguards in the future, the System Studies Section of the Department of Safeguards of the IAEA maintains a computerized data base file where data on nuclear fuel cycle facilities under operation, under construction, and planned, collected from open publications, are stored and updated. A set of computerized programmes has been worked out to forecast both the number of nuclear facilities of different types and the amounts of nuclear materials that may come under safeguards in the future. Simplified models simulating the flows of nuclear materials associated with the operation of power reactors have been adopted for the forecasting of the amounts of nuclear materials. The calculation has dealt only with those types of power reactors for which the operational experience exists and for which a model approach based on that experience could be reasonably applied (PWRs, BWRs, PHWRs and GCRs). (no refs.)

- 60228 Attributes model sampling schemes for international material accountability verification. J.B. Sanborn (Brookhaven Nat. Lab., Upton, NY, USA). *J. Inst. Nucl. Mater. Manage. (USA)*, vol.11, no.4, p.34-41 (Winter 1982).

Addresses the question of detecting falsifications in material balance accountability reporting by comparing independently measured values to the declared values of a randomly selected sample of items in the material balance. A two-level strategy is considered, consisting of a relatively large number of measurements made at low accuracy, and a smaller number of measurements made at high accuracy. Sampling schemes for both types of measurements are derived, and rigorous proofs supplied that guarantee desired detection probabilities. Sample sizes derived using these methods are sometimes considerably smaller than those calculated previously. (3 refs.)

- 60229 Development of an improved monitor for portal detection of the unauthorized removal of special nuclear material. L.W. Kruse, B. Dominguez (Sandia Nat. Labs., Albuquerque, NM, USA). *J. Inst. Nucl. Mater. Manage. (USA)*, vol.11, no.4, p.42-7 (Winter 1982).

A study was made of alternative designs for the portal detection of special nuclear material. Changes in the detector, signal-processing, and alarm logic components improved detection sensitivity and make the system less prone to false alarms. The resulting performance complies with the criteria for allowable frequency of false alarms specified by the Nuclear Regulatory Commission. (7 refs.)

60230 A statistic sensitive to deviations from the zero-loss condition in a sequence of material balances. D.Sellenschegg (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).

J. Inst. Nucl. Mater. Manage. (USA), vol.11, no.4, p.48-59 (Winter 1982). The CUMUFR (cumulative sum of standardized MUF-residuals) statistic is proposed to examine materials balance data for deviations from the zero-loss condition. The time series of MUF-residuals is shown to be a linear transformation of the MUF-time series. The MUF-residuals can directly be obtained by applying the transformation or they can be obtained, approximately, by the application of a Kalman filter to estimate the true state of MUF. A modified sequential test with power one is formulated for testing the CUMUFR statistic. The detection capability of the proposed examination procedure is demonstrated by an example, based on Monte Carlo simulations, where the materials balance of the chemical separation process in a reference reprocessing facility is considered. It is shown that abrupt as well as protracted loss patterns are detected with rather high probability when they occur after a zero-loss period. (16 refs.)

60231 A review of the regulations in various countries with regard to nuclear waste disposal. N.Pelzer (Univ. Göttingen, Göttingen, Germany), P.-G.Gutermuth.

Energiewirtschaft. Tagesfragen (Germany), vol.33, no.3, p.144-8 (March 1983). In German.

An attempt is made to define 'nuclear waste' and 'disposal', both being interpreted somewhat differently in different countries. The German and Swiss legislation regarding waste disposal is similar. A survey of legislation and methods of waste disposal in other countries is made. In some European countries the disposal is carried out by private contractors but in every case the government has the overall control and responsibility. Little is known about legislation and methods of disposal in the USSR and Japan, the latter because of lack of a reliable translation of the relevant Japanese documents. (62 refs.) G.R.S.

60232 Nuclear and materials studies with ion beams. T.W.Conlon (AERE Harwell Lab., Harwell, England).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1209-13 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The main role of the Harwell Laboratory is to develop technology for nuclear power. Broadly this means the elucidation of the nuclear physics underlying fission and fusion concepts and the study and development of suitable materials for all aspects of the fuel cycle. An important and growing part of the Nuclear Physics Division's (NPD) work is the development of programmes spanning both roles. This synergy is clearly apparent in the ion beam work based on the Harwell suite of charged particle accelerators. This report covers aspects of nuclear studies on the accelerators (viz. heavy ion reaction mechanisms; heavy ion range, energy loss and straggling) the associated development of techniques for materials analysis (viz. thin layer activation, microbeam analysis, multielement profiling, etc.) and the commercial exploitation of accelerators and techniques. (5 refs.)

60233 Microbeam analysis of a Commercial Advanced Gas Cooled Reactor material. S.O.Olabanji, J.M.Calvert (Dept. of Phys., Schuster Lab., Univ. of Manchester, Manchester, England).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1246-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The role of silicon as a corrosion inhibitor was investigated by determining the concentration profiles of silicon and the other associated elements in the Commercial Advanced Gas Cooled Reactor (CAGR) material. The microbeam scanning method was employed. Three different alloys namely Fe-9Cr, Fe-9Cr-0.3%Si and Fe-9Cr-0.6%Si were studied by this structure. This, together with the microbeam analysis established the presence of silicon at the metal-oxide interface either alone as silica or coupled with the local chromium to form a chromium-silicon rich barrier layer which influenced the overall oxidation kinetics. (10 refs.)

60234 Evaluation of fuel performance in reactor (PWR). IV. Transient behavior after happening of cladding defect. T.Aoki (Kansai Electric Power Co., Mihama, Japan).

J. At. Energy Soc. Jpn. (Japan), vol.25, no.1, p.29 (Jan. 1983). In Japanese.

For Pt.III see *ibid.*, vol.24, no.12, p.944-62 (1982). Transient phenomena of iodine concentrations in primary coolant which appear after sudden opening of hair crack on fuel cladding under constant power state are analyzed. From these analyses it is understood that the information on every state of cladding defect are given by the observed ^{131}I and ^{133}I concentrations. The direct ejection of uranium fuel by fission fragments and knock-out phenomena to primary coolant which may occur under the most unfavorable condition, are excluded from the paper. Observations of iodine concentrations in primary coolant in every 12 h or 24 h, or even every 48 h under power state are very convenient to get information of cladding defects. (5 refs.)

60235 Proton irradiation damage in cyclically stressed aluminum. W.F.Sommer (Los Alamos Nat. Lab., Los Alamos, NM, USA), D.S.Phillips, W.V.Green, L.W.Hobbs, C.A.Wert.

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.267-76 (Feb. 1983).

High purity aluminum specimens have been irradiated at 50°C with 800 MeV protons using the Los Alamos Meson Physics Facility (LAMPF). Specimens cyclically stressed during irradiation produced only a third as many voids as unstressed control specimens. This is consistent with a model of Green and Weertman which predicts that moving dislocations should be better vacancy sinks than stationary ones. The reduced swelling was observed under the severe conditions of peak swelling temperature and simultaneous He implantation by transmutation. The detailed mode of dislocation motion responsible for the reduction is still under investigation. (28 refs.)

60236 Evaluation of the resistance of irradiated zirconium-liner cladding to iodine-induced stress corrosion cracking. S.Shimada, M.Nagai (Nippon Nuclear Fuel Dev. Co. Ltd., Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.305-11 (Feb. 1983).

An evaluation was made of irradiated zirconium-liner cladding for its resistance to iodine-induced stress corrosion cracking (SCC). Emphasis was put on irradiation-induced hardening in zirconium and SCC resistance in zirconium-liner cladding as compared with Zircaloy-2 cladding. The Vickers microhardness test revealed that crystal bar zirconium experienced less hardening than Zircaloy-2 during neutron exposure. The SCC resistance of zirconium-liner cladding was evaluated for failure strains under the tube pressurization SCC test, and compared with the results of Zircaloy-2 cladding. The failure strains of zirconium-liner cladding were significantly larger than those of Zircaloy-2 cladding over all neutron fluence ranges examined, e.g. more than ten times at $1.0 \times 10^{21} \text{ n/cm}^2$ ($E > 1 \text{ MeV}$). Judging from the results on the Vickers microhardness and SCC tests, good SCC resistance of zirconium-liner cladding could be expected even at high fluences. (12 refs.)

60237 Testing and performance of electrolytic oxygen meters for use in liquid sodium. R.G.Taylor, R.Thompson (UKAEA, Chem. Technol. Div., AERE, Harwell, England).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.25-38 (March 1983).

The performance of yttria-doped thorita ceramic electrochemical oxygen meters in liquid sodium is described. Tests were carried out using laboratory loops. Temperature coefficients of the oxygen meters have been measured between 380°C and 480°C, and the response to changes in oxygen level using cold-trap temperatures from 125°C to 250°C was determined. The ceramic has been shown to give good performance over lifetimes exceeding 400 days in some cases. The temperature coefficients and response to oxygen level changes are in good agreement with thermodynamic predictions. The effect of running the meters in high-oxygen sodium has been studied and a general mode of failure has been shown to be grain-boundary attack by oxygen/sodium solutions. The effect of γ -radiation on the meters has been studied. The meters with a metal/metal oxide reference electrode were unaffected by dose rates up to 52860 mGy h⁻¹. Meters with an air reference electrode do show an effect as a voltage reduction at levels down to 2420 mGy h⁻¹. This effect was temperature-dependent and was insignificant at 500°C. (13 refs.)

60238 Performance of coated UO₂ particles gettered with ZrC. R.E.Bullock, J.L.Kaas (General Atomic Co., San Diego, CA, USA).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.69-83 (March 1983).

In irradiation tests kernel migration in coated UO₂ fuel was eliminated through the use of a ZrC oxygen getter in two types of particles: one in which a solid layer of ZrC was deposited over the kernel, and another in which ZrC was dispersed throughout the pyrocarbon buffer layer surrounding the kernel. Postirradiation annealing tests on these TRISO-coated particles revealed an additional advantage for the particle having the solid ZrC overcoat in that no fission products were released during testing for 36 Ms (10000 h) at 1500°C. The other ZrC-gettered particle, as well as UO₂, UC₂, and mixed UO₂-UC₂ fuels that were included for comparison, released significant amounts of silver and europium through intact coatings in much shorter periods of time under the same conditions. (62 refs.)

60239 Oxygen potentials of (U,Gd)O_{2+x} solid solutions in the temperature range 1000-1500°C. K.Une, M.Oguma (Nippon Nuclear Fuel Dev. Co. Ltd., Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.84-90 (March 1983).

Oxygen potentials of U_{0.86}Gd_{0.14}O_{2+x} and U_{0.73}Gd_{0.27}O_{2+x} solid solutions, together with UO_{2+x}, have been measured at 1000, 1300, and 1500°C by using a thermogravimetric technique. The results at 1000°C show good agreement with the results of a previous solid electrolyte galvanic cell measurement. The oxygen potentials for the solid solutions increase positively with increasing Gd content. Stable hypostoichiometric phases are seen at the oxygen potentials below -65 and -50 kcal/mol between 1000 and 1500°C for U_{0.86}Gd_{0.14}O₂ and U_{0.73}Gd_{0.27}O₂, respectively. From the oxygen partial pressure dependence of x , models for the defect structure in hyper- and hypostoichiometric solid solutions are suggested. (23 refs.)

60240 Titanium-sponge bed to scavenge tritium from inert gases. M.Nishikawa, H.Kido, K.Kotoh, M.Sugisaki (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.101-9 (March 1983).

Chemical getters can be used to scavenge hydrogen isotopes from inert gases in HTGRs or fusion reactors. It is necessary that getter materials have a large gas-solid mass transfer capacity coefficient for scavenging hydrogen isotopes from inert gases. Absorption and desorption characteristics of hydrogen isotopes in a titanium sponge bed is examined. Discussions are mainly based on data obtained from breakthrough curves. Experimental results show that the titanium-sponge bed is a good candidate material for scavenging and fixation of tritium from inert gases. (23 refs.)

60241 Treatment of radioactive wastes by calcination. I. J.Napravnik, L.Neumann, P.Ditl (CVUT, Fakulta Strojní, Praha, Czechoslovakia).

Jad. Energ. (Czechoslovakia), vol.29, no.3, p.86-92 (March 1983). In Czech.

The present paper summarizes recently obtained results in research of radioactive wastes treatment reached in cooperation of Nuclear Research Institute and Prague Technical University. On the basis of gained results and experiences the advantages, disadvantages and trends of the technologies investigated were compared. Main attention was devoted to the research of calcination and denitration. (13 refs.)

60242 Design study of a spent fuel shipping cask for Korea Nuclear Unit-1. Moo Han Kim, Chang Sun Kang (Seoul Nat. Univ., Seoul, Korea).

J. Korean Nucl. Soc., vol.14, no.4, p.196-203 (Dec. 1982). [received: April 1983]

To transport the spent fuel assemblies of Korea Nuclear Unit 1, which is a Westinghouse type two loop pressurized water reactor, it has been found that steel is the most appropriate material for the design of a shipping cask in comparison with lead and depleted uranium. The proposed shipping cask will transport nine fuel assemblies at the same time and is well within the weight limit of transportation by unrestricted rail car. As a safety analysis, the fuel cladding and centerline temperatures were calculated under the accident condition of complete loss of water coolant, and it was found that the temperature was much lower than the limit of the melting point. k_{eff} was calculated with fresh fuel assemblies, and found to be well below 0.95. For shielding computation, the multipurpose Monte Carlo code MORSE-CG and one dimensional discrete ordinates transport code ANISN were used, and the Monte Carlo codes KENO and MORSE-CG were used for criticality calculations. The radiation source terms were calculated using ORIGEN-79. (18 refs.)

60243 The planar track model and the prediction of alpha-recoil aging in radwaste materials. J.Borg, J.C.Dran, Y.Langevin, M.Maurette, J.C.Petit, B.Vassent (Lab. Rene Bernas, Orsay, France).

Radiat. Eff. (GB), vol.65, no.1-4, p.173-81 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

The authors consider the effects of heavy ion irradiation on the chemical reactivity of radioactive waste materials. They present experimental techniques using Pb ions and report new results on the ion-induced etchability of muscovite mica and soda-lime glass which are conveniently described by a refined version of the planar track model. (10 refs.)

60244 Etude theorique des caracteristiques physiques d'un moniteur de reference de mesure de dechets solides contamines au Pu par neutrons passifs en vue de son optimisation (Theoretical study of the physics characteristics of a reference monitor to measure Pu contaminated solid waste by passive neutrons). C.Souga.

Univ. Lyon, France thesis, 10 June 1982. Lyon, France: Univ. Lyon (1982), 114 pp. In French.

A three energy group theory is established to study physical characteristics of plutonium contaminated solid waste reference monitor for passive neutrons measurements. Spontaneous fission neutrons interaction with waste stream

material and neutron leakage interaction with detector assembly are evaluated as a function of a set of physical and geometrical parameters (mass removal coefficient ρR_s (g/cm²); thickness of polyethylene moderator d (cm) and energy E (eV)) using 1D ANISN-W transport code in S_8P_3 and 100 groups approximations. Moreover this study allowed the author to show the 'cross-over' value of ρR_s in proximity of which the dispersion around the mean effective escape probability ^{235}Pu is minimal and to evaluate the 'albedo effect' which represents interaction between sample and detector assembly. The detection probability was evaluated as a function of different geometrical configurations of the detector in order to optimize its construction. Effective neutron escape probabilities calculated for three reference materials (polyethylene, iron and graphite) are in accordance with those given by experimental measurement. (16 refs.)

60245 *Modeles d'interpretation des mesures des actinides par spectrometrie gamma choix d'un moniteur de reference (Model interpretation of actinide measurement by gamma spectrometry using a reference monitor).* J.L.Barou. Univ. Lyon, France thesis, 24 June 1982. Lyon, France: Univ. Lyon (1982), 97 pp. In French.

Passive gamma assay is based on spectrum analysis of the radiation leaked out from the Pu contaminated wastes. Three models for the response of the assay system are developed: point detector, 4π scanning and segmented gamma scanning. The distance between the source and the point detector should be high; the count rate is so low that the source calculated is bad. If source and attenuation inhomogeneity are properly controlled, the 4π detector gives a good accuracy. Inhomogeneity is better treated with segmented gamma scanning employing individual transmission and sample activity measurements for each segment. (25 refs.)

60246 *Criticality safety hazards arising from the transport of fissile materials.* K.M.Leigh, D.J.Mather, P.M.Shaw, K.C.Rushton, P.Hague. Report EUR 8345 EN, Comm. European Communities, Luxembourg (1983), 86 pp. Contract XVII/322/80.5.

A study has been made of hypothetical accidents to a particular design of transport flask, although some of the considerations would apply more generally. Two accidents are considered—one involving the sudden displacement of an element; the other the movement of fragmented fuel from damaged pins. In both cases in order to make the system critical, it has been necessary to arbitrarily alter the calculated values of the effective multiplication factor. Two computer programs are used for the study. The first calculates the initial power pulse and its corresponding energy input to the flask. The second program calculates the longer term diffusion of heat from the fuel through the clad and into the water. Since the study is hypothetical it has been possible to arbitrarily alter the peak values of the effective multiplication factor and determine how this affects the energy release. It is shown how the latter may be dependent also on the boundary conditions to fuel movement, as well as the Doppler effect due to fuel temperature rise and to the reactivity change from density reduction. (5 refs.)

60247 *Catalogue of facilities in Member States of the European Communities for testing the packaging of radioactive materials.* A.Marchal, G.E.Swindell.

Report EUR 8254 EN, Comm. European Communities, Luxembourg (1983), 104 pp.

A group of experts convened by the Commission of the European Communities in Brussels on 2 July 1980 to suggest possible actions in connection with the safe transport of radioactive materials recommended, among other things, that the Commission should collect and distribute information on packaging test facilities in Member States. In response to that recommendation a letter of enquiry was sent informally, on behalf of the Commission, to the competent authorities of the Member States. The purpose of the enquiry is to assist in the effective implementation of the internationally accepted Regulations for the Safe Transport of Radioactive Materials through the dissemination of information on test facilities and on the terms and conditions under which the services of these facilities could be made available for the testing of packaging designed in other countries. As an aid to the presentation of the material in a harmonised format, it was suggested that the information provided should cover relevant topics. The information received by the Commission has been assembled for each installation according to this format.

60248 *General and localized corrosion of carbon and low-alloy steels in oxygenated high-temperature water.* D.D.Macdonald, S.Smalowska, S.Pednekar, T.Mizuno, H.J.Choi.

Report EPRI-NP-2853, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 80 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. The susceptibilities to stress corrosion cracking of two carbon steels (SA106-grB and SA333-gr6) and a low-alloy pressure vessel steel (A508-C12) are studied in high-purity water as a function of oxygen concentration (0.16 to 8 ppm) and high temperature (50 to 288°C). The fracture surfaces of the test specimens are also examined using scanning electron microscopy to determine the mode of failure. The results show that the steels studied are susceptible to stress corrosion cracking in high-temperature oxygenated water under monotonically-rising loads.

60249 *Results of EDF/Framatome underclad crack detection methods.*

P.Sermadiras, J.P.Launay. Report EPRI-NP-2841, Electr. Power Res. Inst., Palo Alto, CA, USA (Jan. 1983), 118 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Describes the development of detection techniques for cracks under the clad of reactor pressure vessel nozzles and steam generator tubesheets. A description of the origin of the underclad cracking problem, the techniques developed to detect the cracks, and the verification of the methods is given.

60250 *Need for geological characterization of low-level nuclear waste disposal sites.* W.B.Caswell (Wright-Pierce Inc., Topsham, ME, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.7-31. Shallow burial of low-level nuclear wastes should facilitate (1) absorption of radiation, (2) long detention time allowing for radioactive decay, and (3) slow release and recycling of the waste products into the environment. Subsurface disposal sites are typically dominated by water that occurs either as soil moisture in the unsaturated zone or as groundwater in the underlying saturated zone. Migration from the burial site is inevitably along hydraulic gradients by soil moisture and ground water. Even under the most simple of geologic situations, the measurement, calculation and use of hydraulic conductivity values and other important factors needed to assess groundwater impacts requires the use of simplifying assumptions. The fact that geologic complexities exist makes it imperative that they be fully characterized such that the simplifying assumptions necessary for hydraulic analysis can be made and the reasonableness of their application verified. (no refs.)

60251 *Geological and geophysical techniques for development of siting and design parameters.* A.W.Hatheway (Dept. of Geological Engng., Univ. of Missouri, Rolla, MO, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.33-50. The licensability and functionality of each low-level radioactive waste disposal facility will be determined by the geologic environment in which it is to be placed, and by the expertise and goodwill of the scientists and engineers involved in its design and licensing. Geologic site characterization is the first and most basic step in that process. The geological and geophysical means by which this characterization is accomplished must be chosen and employed in the full mutuality of the fact that geology governs geophysical response and that geophysical interpretation is absolutely essential in characterizing the length, breadth, and depth of each site. Each step in the employment of geological and geophysical techniques must be made with total incorporation of related data and findings. Severe introspection and questioning must be accomplished immediately on the development of each line of evidence, and the results must be applied directly and immediately to each remaining activity. (3 refs.)

60252 *A geological case history: lessons learned at Sheffield, Illinois.* K.Kartwright (Illinois State Geological Survey, Champaign, IL, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.67-80. The Sheffield Low-Level Radioactive Waste Disposal Facility was established in 1968 following a two-year site evaluation process. The site exploration program was considered at the time to be extensive and quite complete. However, in current practice, a site exploration program of the type conducted in 1967-1968 is only considered a preliminary program to determine if a detailed investigation of the site is warranted. Subsequent investigations at Sheffield have disclosed hydrogeologic conditions much more complex than indicated by initial exploration program. But the question still remains regarding the degree of site exploration necessary to adequately characterize a potential disposal site. Both excessive and inadequate exploration programs are to be avoided. Given the present state of knowledge of the stratigraphy and hydrogeology of the site, the question remains whether the site would be licensable in 1982. (4 refs.)

60253 *Geotechnical and geomechanical parameters required for characterization of sites.* D.E.Daniel (Univ. of Texas, Austin, TX, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.93-115. Characterization of disposal sites will involve geotechnical investigations and measurement of dozens of geomechanical parameters. The required investigations may be performed in stages, beginning with a preliminary study, or in a single evaluation. The geotechnical investigation will deal with the actual disposal site and the immediate area surrounding the site, and may include more detailed evaluation of the waste, disposal pits, and waste handling or processing structures. With respect to the actual site, the investigation is likely to focus on evaluating: (1) the types of subsurface soils or rocks present; (2) stability of the site; (3) potential for erosion; (4) groundwater conditions; and (5) sources for construction materials. A variety of tests, some routine and some requiring state-of-the-art techniques, would be needed to measure parameters related to strength, compressibility, and permeability. The important mechanical properties of the waste (average density, compressibility, and potential for generation of gas) may be measured or, in some cases, estimated from experience. (3 refs.)

60254 *Variations of geomechanical properties.* P.A.Hustad, J.A.Ruf (Burns & McDonnell Engng. Co., Kansas City, MO, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.117-49. Discusses the role of the geotechnical engineer in acquiring the subsurface data necessary for the design and analysis of low-level radioactive waste disposal facilities. First, it should be recognized that the design and analysis of these environmentally complex facilities encompass a large number of technical disciplines. In regard to subsurface characterization of disposal sites the disciplines of geology, ground-water hydrology, environmental/civil engineering, and geotechnical engineering must work hand in hand. This close working relationship is necessary because each specialist is dependent upon the other for input that is required for adequate characterization of the site in regard to the proposed disposal facilities. (15 refs.)

60255 *Geotechnical measurements at the Maxey Flats, Kentucky low-level radioactive waste disposal site—lessons learned.* J.L.Grant (Law Engng. Testing Co., Englewood, CO, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.151-63. The Maxey Flats site was opened in 1963 and used for the disposal of low-level radioactive waste until site closure in July, 1978. Prior to opening, studies were conducted to assess suitability of the site for the disposal of low-level radioactive waste. The scope of these studies was consistent with that of similar studies at the time, but was less detailed than similar studies today. A significant quantity of radioactive materials has been disposed at the site without apparent damage to the surrounding environment, indicating a reasonably successful site design. However, several operational problems were encountered. The author reviews major operational problems at the site, and to assess the knowledge from the experience gained at the Maxey Flats site which can be related to geotechnical investigations at similar sites. (6 refs.)

60256 *Hydrologic characterization of sites for shallow disposal of low-level radioactive wastes.* S.N.Davis (Dept. of Hydrology & Water Resources, Univ. of Arizona, Tucson, AZ, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.177-94. For site characterization of low-level disposal sites, point measurements of hydraulic head, hydraulic conductivity, sorptive characteristics of the solid materials, and water chemistry (including stable and unstable nuclides) must be numerous enough to define local paths and rates of potential contaminant movement. Special attention must be given to local zones of high conductivity which are commonly fractures in clay-rich materials but may also be small lenses of coarse silt, sand, and gravel within non-indurated sediments. For shallow hydrogeologic systems, the presence of anthropogenic materials in subsurface gas and water provides the best information on existing rates and directions of fluid movement. Of the numerous materials which can be detected, tritium and chlorofluoromethanes have proved most useful. Chlorine-36 from thermocuclear testing can be used to pinpoint 1954-1964

water. If analytical methods could be simplified, helium-3 and krypton-85 would be also highly useful. (10 refs.)

60257 Techniques of groundwater investigation at proposed low-level nuclear waste disposal sites. C.W.Fetter, Jr. (Law Engng. Testing Co., Marietta, GA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.195-216. The proposed rule 10CFR Part 61 for licensing of LLW near surface disposal sites states that 'the groundwater pathway will generally be the most significant in terms of releases of radioactivity'. The various techniques for investigating the properties of groundwater at a proposed disposal site are described. (17 refs.)

60258 Ground-water monitoring techniques for low-level radioactive disposal sites. S.D.Johannsen, D.G.Nichols (Residuals Management Technol. Inc., Madison, WI, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.217-36. Ground-water quality monitoring at low-level radioactive waste land disposal sites will provide needed data for evaluating whether these sites are meeting the performance objectives specified in the Nuclear Regulatory Commission's licence requirements. The authors summarize the techniques available for collection and analysis of ground-water samples, particularly for radiological parameters. Quality control and quality assurance are emphasized in all monitoring methods presented. Each aspect of monitoring, from system design to sample collection and laboratory analysis, must follow prescribed methods in order to yield data which are representative of actual ground-water quality. Routine evaluation of the data is also discussed in relation to both quality control analysis and determination of low-level facility performance. (10 refs.)

60259 Lessons learned in a hydrogeological case at Sheffield, Illinois. J.B.Foster (US Geological Survey, Urbana, IL, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.237-44. The US Geological Survey began a study of the hydrogeology of the low-level radioactive-waste disposal site near Sheffield, Illinois, in 1976. The purpose of the study was to determine how the glacial sediments were functioning as a containment for radionuclides. The scope of the study was to define geologic, hydrologic, and geochemical elements necessary to describe the hydrogeologic system. The geologic elements to be described were the stratigraphy, lithology, and mineralogy. The hydrologic elements included the hydraulic properties of the sediments and the rate and direction of water movement through both unsaturated and saturated zones within the glacial deposits. Geochemical elements included cation exchange capacity, soluble mineral chemistry, and ground-water quality. Hydrogeologic information from Sheffield and other radioactive-waste sites will be used to define the essential hydrogeologic factors necessary to quantitatively predict the concentration of radionuclides migrating in ground water from future burial sites. (2 refs.)

60260 Surface water considerations for low-level radioactive waste site. Y.C.Chang (Environmental Engng. Div., Stone & Webster Engng. Corp., Boston, MA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.263-71. To ensure that the objective of isolation of low-level radioactive wastes and stability of the disposal site after closure can be achieved, the surface hydrology of the potential site must be carefully characterized prior to engineering and operation. At a site the most important considerations with regard to flooding, infiltration, erosion, and pathway of radionuclides are addressed as they relate to streams, ponds, hydraulic structures, and surface water users. To satisfactorily characterize the site, the type and amount of data and analyses needed for licence applications and the environmental report are discussed. The discussion also includes potential sources of available data, the field data collection program that may be necessary, and methodologies that can be used for analysis. (23 refs.)

60261 Hydrologic and hydrodynamic aspects of low-level radioactive waste disposal to streams. P.H.Carrigan, Jr. (US Geological Survey, Reston, VA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.273-94. Characterization and monitoring of disposal sites require unique approaches in gathering information on hydrologic and hydrodynamic aspects of low-level radioactive waste disposal to streams. Continuous monitoring of a receiving stream is needed to detect the onset of contamination and to determine the subsequent contaminant loading. With expected low radionuclide levels, the monitoring will involve regular withdrawal, concentration, and analysis of samples. Therefore the monitoring system includes streamflow measuring stations as well as sample-collection systems. Depending on flow measuring conditions, the sampling may be continuous and in proportion to the flow, automated, or done manually. (41 refs.)

60262 Effect of releases from near-surface low-level waste sites on surface water quality. F.L.Parker (Vanderbilt Univ., Nashville, TN, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.295-327. Discusses the effects and detection of radioactive releases from near-surface LLW sites in streams. The surface water quality is also discussed. (67 refs.)

60263 Environmental information needed to license a low-level waste disposal facility. C.A.Little, L.D.Voorhees, R.M.Reed (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.341-75. Proposed Nuclear Regulatory Commission Rules 10 CFR Part 61 and 51 describe licensing requirements for land disposal of low-level radioactive waste. Necessary site-specific information required to estimate public health impacts include, but are not limited to, descriptions of facility design, radiologic inventory, demography, soils, topography, surface and subsurface hydrology, meteorology, ecology, and land use practices in the vicinity of the site. Low-level waste disposal actions may also be constrained by potentially significant environmental issues such as impacts to endangered species, removal of prime and unique farmland, effects on cultural resources and location on floodplains or wetlands. A thorough review of both radiological and nonradiological issues conducted early in the development of a project will facilitate compliance with environmental legislation so that unnecessary project delays may be avoided. (17 refs.)

60264 Some interactive factors affecting trench cover integrity on low-level waste sites. T.E.Hakanson, L.J.Lane, J.G.Steger, G.L.DePoorter (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.377-93. Identifies and discusses trench cover related processes by which radionuclides from low-level waste disposal sites may enter biological pathways, based on a review of past performance of commercial and Department of Energy sites, and on an analysis of the interdependence of those processes using a state-of-the-art water balance model. From that analysis, information needs for site characterization and monitoring are identified to assist in designing effective trench cover systems and to monitor site performance. (42 refs.)

60265 Air quality measurements for site characterization. M.W.Carter, W.C.Conklin (School of Nuclear Engng. & Health Phys., Georgia Inst. of Technol., Atlanta, GA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.401-22. Effective and timely site characterization is an important part of selecting a site for low-level waste disposal. Parameters measured can be compared with pertinent regulatory requirements, used for a reference base, helpful in evaluating environmental impacts, utilized in documenting changes in control programs, of value in modeling studies and other data uses, and beneficial in providing relevant sampling and methodology training. The authors focus on specific air quality measurements which should be an inherent part of the site characterization program. The program is designed to measure, quantify, and identify contributions from site uses (operational procedures), atmospheric fallout, natural radioactivity, and vicinity and regional applications of radionuclides. The recommended air quality measurements program will be described in association with a reference site developed by the US Nuclear Regulatory Commission. (19 refs.)

60266 Radiochemical measurements for evaluating air quality in the vicinity of low-level waste burial sites—the West Valley experience. J.M.Matuszek (Center for Labs. & Res., New York State Dept. of Health, Albany, NY, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.423-42. The waste buried at the West Valley site, New York, consists mainly of low density, low specific activity substances which decomposed in the wet surroundings giving rise to various radioactive gases. Radiochemical measurements for evaluating the air quality in the vicinity of the site are described. (32 refs.)

60267 Meteorology and climatology as parameters on low level waste disposal monitoring. W.M.Culkowski (Atmospheric Turbulence & Diffusion Lab., NOAA, Oak Ridge, TN, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.449-54. Once a site has been chosen for the burial of low level wastes, meteorological input is required in two forms, as climatology and as an estimator of airborne concentrations. The climatological data are fundamental to assessing hydrologic flow which may transport waste material from the original site. Airborne nuclear activity may occur by accidental release of material during the active burial phase or may result from gas formation in the trenches over a period of years. (18 refs.)

60268 On-site meteorological measurements for low-level radioactive waste disposal. T.J.Lockhart (Meteorology Res. Inc., Altadena, CA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Site Characterization and Monitoring (NUREG/CP-0028), Arlington, VA, USA, 16-17 June 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982), p.455-61. The technical position paper (April 1, 1982) of the Low-Level Waste Licensing Branch of the US Nuclear Regulatory Commission suggests the variables to be measured, the time period for measurement and the application for which the measurements are required. The author discusses hardware and software considerations for the meteorological monitoring system in terms of accuracy requirements by variable, system quality control, data validation, and representativeness by variable. A cost estimate of this effort is also discussed. (7 refs.)

60269 Characterization of mechanical properties of nuclear waste glasses. H.Richter (Fraunhofer-Inst. fur Werkstoffmechanik, Freiburg, Germany), P.Offermann.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.229-38.

Glass and glass ceramics are regarded as suitable nuclear waste solidification products; mechanical stability is one of the important properties of the material. Such mechanical stability is necessary on the one hand for the safe handling and transportation of nuclear waste glass, and on the other for its relevance to leaching processes. Leaching by water or by aqueous solutions must be regarded as the most dangerous process by which radioactive materials can be set free from the glass. Because the leaching rate is proportional to the total surface area of the materials exposed to the liquid, it is of utmost importance to keep this area as small as possible and to prevent any enlargement by cracking processes which can arise due to mechanically or thermally induced stresses. (8 refs.)

60270 Fracture appraisal of large scale glass blocks under realistic thermal conditions. F.Laude, E.Vernaz, M.Saint-Gaudens (Dept. de Genie Radioactif, CEA, Valrhon, France).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.239-47.

The compositions of borosilicate glasses used to solidify fission product solutions are selected for their low leach rates. Fracturing of the glass blocks, caused primarily by thermal and residual stresses during cooling, increases the potential leaching surface area and the number of small particles, both of which are undesirable since long term container failure must be considered. It is therefore important to know the state of fracture of the glass occurring at different stages of its thermal history. A theoretical appraisal of the fracture state of the glass is presented, complemented by an experimental study using industrial scale glass blocks under realistic thermal conditions. (5 refs.)

- 60271 An attempt to assess the long-term crystallization rate of nuclear waste glasses.** N.Jacquet-Francillon, F.Pacaud, P.Queille (Dept. de Genie Radioactif, CEA, Valrho, France). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.249-59. The crystallization of fission product glasses is generally caused by maintaining these glasses at high temperatures (600° to 900°C) for several days or weeks in order to evaluate the effects of crystallization on leach resistance and mechanical properties. At the CEA Marcoule, isothermal calorimetry has been used to measure the thermal release which accompanies crystallization in order to attempt to quantify the devitrification capacity of the different glasses tested and to establish the time-temperature relationships. Such data could allow for long-term, low temperature extrapolation of the behaviour of the glass during geological storage. The present work describes the results obtained using three non-radioactive glasses of increasing chemical complexity. (16 refs.)
- 60272 Quantitative determination of crystalline phases in nuclear waste glasses.** R.H.Feld, M.Stammler (Battelle-Inst. eV, Frankfurt/Main, Germany). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.261-71. In order to assess the longterm chemical and physical stability of high level waste glasses it is important to know the amounts of crystalline phases present. To test the merits of the quantitative X-ray powder diffraction analysis for the characterization of nuclear waste glasses, measurements were carried out to determine relatively small weight fractions of crystalline phases next to high concentrations of amorphous materials, test whether components remain stable in their crystalline state, yield new crystalline compounds or dissolve in the glass matrix, and determine the total crystallinity of nuclear waste products. The 'matrix flushing' method was chosen since it was considered to be accurate, fast, and relatively easy to apply. (8 refs.)
- 60273 Effect of Fe₂O₃/ZnO on two glass compositions for solidification of Swedish nuclear wastes.** J.L.Nogues (Lab. des Verres, Univ. des Sci. et Tech. du Languedoc, Montpellier, France). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.273-8. A recent study concluded that addition of Fe₂O₃ to a soda borosilicate nuclear waste glass may significantly reduce damage by water attack due to formation of a Fe-rich film on the glass surface. However, differences in SiO₂, B₂O₃, CaO and concentration of fission products in previous glass compositions make it impossible to ascribe the improved leach resistance solely to Fe₂O₃ content. In the present work, leaching behavior of two glasses are compared which differ only by the substitution of Fe₂O₃ for some of the ZnO in the glass. Both glass compositions are compatible with the French AVM process and contain 9% (by weight) of simulated waste products characteristic of the Swedish nuclear waste program. (6 refs.)
- 60274 Investigation on the oxidation state and the behaviour of molybdenum in silicate glass.** A.Horneber (Inst. für Werkstoffwissenschaften III, Univ. Erlangen-Nürnberg, Erlangen, Germany). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.279-88. Knowledge about the oxidation state of molybdenum in glasses and glass ceramics which contain nuclear waste is important because of the danger of formation of water-soluble Cs-molybdate with Cs-137. The authors deal with the following aspects: (1) oxidation state of Mo when organic reducing agents, i.e. formic acid, formaldehyde, tannic acid, are added to the batch; (2) dependence of Mo 'solubility' on the melting atmosphere; (3) behaviour of the different oxidation states of Mo depending on the temperature and the basicity of the glass; and (4) redox interaction of Mo with Fe, Cr and Ti. (14 refs.)
- 60275 The materials balance—scientific fundamentals for the quality assurance of vitrified waste.** E.Schiewer, H.Rabe, S.Weisenburger (Hahn-Meitner-Inst. für Kernforschung Berlin GmbH, Berlin, Germany). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.289-97. In the vitrification of HLW the aim is to create a product, the stability (thermal, mechanical) of which is, to the greatest possible degree, independent of fluctuations in its composition. Process control during vitrification of HLW is necessary in order to assure the quality of the final glass product. The chemical processes are controlled by quantitative analysis of all material streams entering and leaving the melting device. There are six material streams to consider: frit input, waste input, corrosion products (generated by the vitrification process), off-gas, recycled off-gas, glass output. Additionally, the capacity of the glass for buffering short-term fluctuations in the incoming streams must be known. Sufficient sampling during non-radioactive vitrification in addition to materials tests can provide the necessary data basis. The results are combined in a materials balance, which might provide a scientific basis for reliable quality assurance when sampling is limited. (2 refs.)
- 60276 Incorporation of high-level wastes in Synroc: results from recent process engineering studies at Lawrence Livermore National Laboratory.** J.H.Campbell, C.L.Hoenig, F.J.Ackerman, P.E.Peters, J.Z.Grens (Lawrence Livermore Nat. Lab., Livermore, CA, USA). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.299-308. In October 1981 Synroc-D was selected as the reference alternate waste form for borosilicate glass for immobilisation of defence waste. A total of eight candidate waste forms competed in this selection process and the decision of which alternate waste form to choose was based primarily on performance properties. The authors summarise highlights from recent engineering research and development, in particular, results from fluidised bed calcination studies of Synroc slurry. (13 refs.)

- 60277 The microstructure of Synroc.** D.R.Cousens, S.Myhra, J.Penrose, R.L.Segall, R.St.C.Smart, P.S.Turner (School of Sci., Griffith Univ., Nathan, Queensland, Australia). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.309-18. The Synroc concept was introduced by Ringwood in 1978 and, as is well known, the material now proposed for the disposal of high-level civilian nuclear waste consists primarily of hollandite (BaAl₂Ti₂O₁₀), perovskite (CaTiO₃) and zirconolite (CaZrTi₂O₇). Microstructural information for Synroc B and Synroc C are given. (13 refs.)
- 60278 SIMS depth profiling studies of sphene-based ceramics and glass ceramics leached in synthetic groundwater.** P.J.Hayward, W.H.Hocking, F.E.Doern, E.V.Cecchetto (Whiteshell Nuclear Res. Estab., Atomic Energy of Canada Ltd., Pinawa, Manitoba, Canada). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.319-28. Glass ceramics and ceramics based on the mineral sphene (CaTiSiO₆) are being developed to host the wastes arising from possible future CANDU fuel reprocessing. Results from leaching tests in deionised water and in synthetic groundwater indicate that these materials are highly durable. Secondary ion mass spectrometry (SIMS) depth profiling of leached specimens suggests that leaching in the glass ceramics is predominantly confined to the glass phase. The high ionic strength and composition of the groundwater have a significant passivating effect on leaching and surface alteration phenomena, and encourage the precipitation of new phases on the ceramic surface. Leaching results, scanning electron microscope observations and SIMS depth profile measurements are compared and discussed. (11 refs.)
- 60279 Leaching of natural and synthetic sphene and perovskite.** J.B.Metson, G.M.Bancroft, S.M.Kanetkar, H.W.Nesbitt, W.S.Eyre (Dept. of Geology, Univ. of Western Ontario, London, Ontario, Canada), P.J.Hayward. Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.329-38. Atomic Energy of Canada Limited (AECL) is currently investigating the use of sphene-based glass ceramics to host the wastes produced from possible reprocessing of irradiated CANDU fuels. The authors report on the leaching behaviour of natural and synthetic sphenes and a CaTiSiO₆ glass, in deionised water, with varying pH and with Ca²⁺ and silica additions to the leachant. Leaching studies on natural and synthetic perovskite in deionised water are also reported. (11 refs.)
- 60280 Effects of radiation damage and radiolysis on the leaching of vitrified waste.** W.G.Burns, A.E.Hughes, J.A.C.Marples, R.S.Nelson, A.M.Stoneham (AERE, Harwell, England). Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.339-48. Attack on the glass by leaching in water is the only probable process by which the long-lived radioactive isotopes incorporated in vitrified waste might be returned to the environment after future disposal. Radiation from the incorporated waste could increase the leach rate either by damaging the structure of the glass or by radiolysing the water near the glass surface to produce ionic species that attack the glass more readily. (25 refs.)
- 60281 Structural effects of radiation damage in silica based glasses.** A.Manara, P.N.Gibson (Joint Res. Centre, Ispra, Italy), M.Antonini. Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.349-56. The results of recent measurements of optical absorption, etching rate and transmission electron microscopy in pure silica and borosilicate glasses are reported and discussed. At dose saturation conditions, the dependence of the optical density associated with the production of single atomic defects from the mass of the impinging particle shows a marked saturation at masses ≥ 20 amu. The corresponding etching rates increase by about 4 times with respect to unirradiated samples. In borosilicate glasses, the temperature dependence of the threshold dose rate of electrons to initiate the nucleation of bubbles shows a marked increase from about 300 to 600K. (9 refs.)
- 60282 Near-surface leaching studies of Pb-implanted Savannah River waste glass.** G.W.Arnold, C.J.M.Northrup (Sandia Nat. Labs., Albuquerque, NM, USA), N.E.Bibler. Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.357-68. The present experiments with SRP simulated nuclear waste glass implanted with Pb ions (see the Experimental Section), used RBS and ERD to follow in detail the changes in composition which occur in the near-surface region upon leaching in deionised water at 90°C. Analyses of the leach solutions were made in an attempt to correlate the actual leach rate with the observed near-surface compositional changes. These experiments show that radiation damage can cause changes in the composition of the near-surface of the leached glass. The authors also find that a critical fluence is reached where abrupt changes of the surface elemental composition occur as a result of leaching. The analyses which were made indicate that the amount of material actually leaving the glass is not significantly increased as a result of the radiation damage. (18 refs.)
- 60283 A study of radiation effects in curium-doped Gd₂Ti₂O₇ (pyrochlore) and CaZrTi₂O₇ (zirconolite).** J.W.Wald (Pacific Northwest Lab., Richland, WA, USA), P.Offermann. Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.369-78. The experimental results presented describe alpha decay self-damage studies in ²⁴⁴Cm-doped Gd₂Ti₂O₇ and CaZrTi₂O₇ single-phase, polycrystalline materials. Property behaviour was monitored at ambient temperature by X-ray diffraction and apparent density measurements during the initial damage ingrowth period (approximately 2-year time span). Microstructural examination was conducted by optical metallographic techniques after an X-ray amorphous state was reached. Results are compared with those of others on the ingrowth of damage effects in natural and synthetic zirconolites. (21 refs.)

60284 Dose-dependence of Pb-ion implantation damage in zirconolite, hollandite, and zircon. T.J.Headley, G.W.Arnold, C.J.M.Northrup (Sandia Nat. Labs., Albuquerque, NM, USA).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.379-88.

An accelerated ageing test which reliably simulates the α -recoil damage accumulated during thousands of years of waste storage is desirable. One recent approach to this simulation is to implant the waste form with heavy Pb-ions. If the validity of this approach is to be fully assessed, two important questions which have not yet been investigated must be answered. (1) Is the structural damage, including cumulative effects, similar for irradiation by Pb-ions and α -recoil nuclei in a given material? (2) Is the dose-dependence of the accumulated damage similar? The purpose of this investigation was to assess the extent of these similarities in selected materials. The authors utilised transmission electron microscopy (TEM) to characterise the radiation damage and measure its dose-dependence. Synthetic crystalline zirconolite and (Ba,Ti)-hollandite, and natural crystalline zircon were implanted with Pb-ions over a wide range of equivalent α -doses and then characterised by TEM. (20 refs.)

60285 Leachability of zircon as a function of alpha dose. R.C.Ewing, R.F.Haaker, W.Lutze (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.389-97.

The variation in the leachability of naturally occurring zircons ($ZrSiO_4$) as a function of total alpha dose has been measured at 87°C. For calculated doses in the range of 10^{16} to 10^{18} alphas/gm there is an increase of one order of magnitude in the weight percent of zircon that is dissolved and an increase in the leach rate of the zircon 2.9×10^{-8} to 2.3×10^{-7} gm/cm² day. Totally metamict specimens (dose $\geq 10^{19}$ alphas/gm) have leach rates as high as 1.8×10^{-6} gm/cm² day. (29 refs.)

60286 Isotopic fractionation of thorium and uranium upon leaching of monazite: alpha-recoil damage effects. Y.Eyal (Dept. of Nuclear Engng., Technion-Israel Inst. of Technol., Haifa, Israel).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.399-408.

Studies a monazite sample from New Mexico, USA and presents data on the leaching behaviour up to dissolution of ~1.8% of the total ²³²Th radioactivity. These studies are of use in the field of nuclear waste disposal. (4 refs.)

60287 Investigation of titanium in metamict Nb-Ta-Ti oxides using the extended X-ray absorption fine structure technique. R.B.Greger, F.W.Lytle (Boeing Co., Seattle, WA, USA), R.C.Ewing, R.F.Haaker.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.409-18.

An important approach in the evaluation of crystalline waveforms is to study the long term stabilities of closely related mineral species which have become metamict (radiation damaged) and have been exposed to weathering processes for geologic periods of time. The documented metamictisation and alteration effects can then be used as 'benchmarks' for comparison with the results of short term laboratory leaching and irradiation experiments which have been designed to simulate long term effects. The Nb-Ta-Ti complex oxide minerals, containing appreciable rare earth elements (REE), U, and Th, are natural analogues for phases in proposed titanate radioactive wasteforms. Because of the geochemical similarities among Ti, Nb and Ta, a study of the metamict state and alteration effects in complex Nb-Ta-Ti oxides may yield data that is important in evaluating the long term stability of radioactive wasteforms. The investigation reported here is concerned with the application of the extended X-ray absorption fine structure and X-ray absorption near edge structure spectroscopy to the study of the structure of the metamict state. (18 refs.)

60288 The isolation capability of a salt dome utilised for high-level waste disposal. J.Hamstra (Netherlands Energy Res. Found., Petten, Netherlands).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.419-28.

Rock salt can, because of its plastic properties, be utilised as a potential host rock in such a way that its function as a natural barrier becomes dominant in the overall disposal concept. It is this rock salt and more in particular this salt dome specific potential that is discussed. (4 refs.)

60289 Dissolution rate of salt domes on the basis of interpretation of measured salinity profiles. K.E.Lindstrom Jensen (Elsam, Fredericia, Denmark).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.429-38.

When radioactive waste is disposed in a salt dome, it is important to evaluate the hydrologic stability of the dome. It depends on the dissolution rate of the dome, which again is determined by the transport and dispersion properties of the cap rock and the other formations surrounding the dome. The same properties are also required in safety assessment work for calculation of migration of radionuclides, which might be released from the dome to the surrounding strata. Analytical solutions are described for calculation of salt concentrations in ground water corresponding to a certain dissolution rate of the dome. Using these solutions a method is described, which makes it possible to determine rate of dissolution, ground water velocity, and dispersivity in the strata just above cap rock on basis of measured salinity profiles above the dome. (3 refs.)

60290 Dissolution of evaporites and its possible impact on the integrity of the Waste Isolation Pilot Plant (WIPP) New Mexico, USA. M.Zand (New Mexico Health & Environment Dept., Santa Fe, NM, USA).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.439-48.

Discusses the manifestation of dissolution processes (such as land subsidence and method of formation of breccia pipes and brine reservoirs) in the bedded salt of southeastern New Mexico in the vicinity of the WIPP site. The author postulates conditions under which breaches of the repository might occur, discusses radiological consequences of such breaches, and identifies areas that need further investigation. (15 refs.)

60291 Deformation-dissolution potential of bedded salt, Waste Isolation Pilot Plant site, Delaware Basin, New Mexico. R.Y.Anderson (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.449-58.

Deep-seated collapse and brecciation is a feature common to bedded salt in a number of evaporite basins. The origin of these features is poorly understood. The relatively young geologic age of uplift and exposure of evaporites in the Delaware Basin, and a still-active hydrologic system, provides a unique opportunity to examine the pathways of water movement related to collapse features and salt dissolution. In addition, salt deformation structures are closely associated with brine, dissolution, and collapse. The author briefly discusses evidence for deep-seated dissolution, considers the relationship between deformation, dissolution, and brine, and examines the potential for dissolution at the WIPP (Waste Isolation Pilot Plant) site with respect to stages in the deformation-dissolution process. (15 refs.)

60292 Mineralogical and geochemical factors influencing the final disposal of HLW in the Stassfurt Halite. H.Gies (Gesellschaft für Strahlen- und Umweltforschung mbH München, Inst. für Tief Lagerung, Braunschweig, Germany).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.459-65.

As the thickest and primarily monomineralic saline horizon in the Federal Republic of Germany, investigation of the Zechstein-2-series, Stassfurt-Halite (Na₂) is being emphasized for the final disposal of HLW. This horizon is of particular importance, especially since it is the base of the whole saline formation in northern Germany. Mineralogical and geochemical factors are discussed. (8 refs.)

60293 Gas production and liberation from rock salt samples and potential consequences on the disposal of high-level radioactive waste in salt domes. N.Jockwer (Gesellschaft für Strahlen- und Umweltforschung mbH, Inst. für Tief Lagerung, Braunschweig, Germany).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.467-75.

Rock salt from the north German salt domes which are to be used for disposing high level radioactive waste consist, along with the major mineral halite, the minor minerals anhydrite, polyhalite and kieserite and of some trace minerals such as carbonates, clay, bitumen components. In the surroundings of an emplacement borehole with high level radioactive waste the rock salt will be heated to about 200°C and the water of the hydrated minerals as well as the water and gas adsorbed on the crystal boundaries and present as inclusions will be liberated into the intergranular spaces. At the elevated temperature carbon dioxide, different hydrocarbons, hydrochloric acid and sulphur dioxide may be generated by thermal decomposition of the carbonates, clay, bitumen and other trace minerals. As a result of γ -radiation gases such as hydrogen, oxygen, hydrochloric acid and carbon dioxide will be generated by radiolysis. (3 refs.)

60294 Thermomechanical in-situ experiments and finite element computations. A.Pudewils, R.Müller, E.Korthaus, R.Koster (Inst. für Nukleare Entsorgungstechnik, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.477-86.

In the ultimate storage of high level wastes in rock salt thermomechanical phenomena caused by the temperature rises play an important role for elaborating the storage concept. Important factors are both large space effects concerning the repository and the geological formation and small space phenomena influencing to a considerable extent the interaction between waste blocks and the host rock. While the large space aspects are largely inaccessible to an experimental investigation, the small space effects, especially the convergence behavior of individual heated bore-holes, are eligible for a systematic experimental and computational study allowing verification of available computational methods and thermomechanical material laws for rock salt. Three in-situ experiments were performed in ASSE, using a convergence measuring probe specifically developed for such investigations, and evaluated with the help of thermomechanical model computations. (3 refs.)

60295 Investigations of the solution behaviour of NaCl in the quinary system NaCl-KCl-MgCl₂-MgSO₄-H₂O at different temperatures. R.Conradi, H.Engelke, A.Kaiser (Fraunhofer-Inst. für Silicatsforschung, Würzburg, Germany).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.487-90.

The German concept of high level waste final storage by the aid of waste glasses is based on rock salt formations as deposits. Investigations consider the accidental case of water entrance into the deposit where the waste forms then are exposed to highly concentrated salt brines at elevated temperatures and pressures. In order to achieve standard corrosion conditions for the investigations of waste forms, a set of salt brines of definite composition has been generally accepted as possible corroding agents. The agreement is based on a model for the process of a hypothetical water entrance saying that in the initial period the entering water approaches a solution equilibrium at lower temperatures with the solid phases containing sodium, potassium and magnesium sulfates and chlorides. In the rock salt environment of the deposit higher temperatures will occur due to the radioactivity of the waste forms. That is why an additional uptake of NaCl by the 'standard brines' has to be taken into account. The intent of the investigations was to determine the additional amount of NaCl which can be dissolved at higher temperatures in a so-called Q-solution. (2 refs.)

60296 Investigation of diffusion of UO₂Cl₂ in saturated NaCl solutions. H.Murso, B.Plewinsky, D.Leopold, G.Marx (Inst. of Inorganic & Analytical Chem., Free Univ. of Berlin, Berlin, Germany).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.491-6.

Even in the early 1960s it had already been decided to place high-level radioactive waste in the salt formations of the Federal Republic of Germany. However a major concern is the formation of highly corrosive brines in the event of water filling the repositories. In order to estimate the risks of waste storage in salt repositories it is necessary to investigate the physico-chemical

properties of the waste materials and of those radionuclides extracted into brine. The extraction of radionuclides from borosilicate glasses or spent fuel elements has been previously discussed, taking into consideration the two transport mechanisms: diffusion and convection. Diffusion measurements of actinides in saturated NaCl solutions have been made in order to determine which mechanism is rate determining. The diffusion coefficients of UO_2Cl_2 in saturated NaCl solutions were measured by use of an ultracentrifuge at 25, 40 and 50°C. The results are compared with those determined for the binary system $\text{UO}_2\text{Cl}_2\text{-H}_2\text{O}$. Measurements of viscosity and molar mass were made in order to elucidate the difference in diffusion velocities in the systems studied. (12 refs.)

60297 The importance of near-field phenomena for nuclide release from a flooded salt dome repository. R.Storck (Tech. Univ. Berlin, Berlin, Germany).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.497-507

Deals with the first step in identification of relevant near field phenomena for the scenario 'penetration of brine into a backfilled HLW-repository, directly after its closure'. By use of parameter variation, the relevant phenomena for the release of Tc-99 from the salt dome are identified. (9 refs.)

60298 Diffusion in crystalline rocks. K.Skagius, I.Neretnieks (Dept. of Chem. Engng., Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.509-18

Laboratory experiments to determine the sorption and the rate of diffusion of cesium and strontium in pieces of granite have been performed. The effective diffusivity, D_{p-p} was found to be $1.2 \times 10^{-12} \text{ m}^2/\text{s}$ for both cesium and strontium. The diffusion of nonsorbing species in granites and other rock materials have been studied in laboratory scale. The non-sorbing species were iodide, tritiated water, Cr-EDTA and Uranine. In granites the effective diffusivities were determined to be $0.7\text{-}1.3 \times 10^{-13} \text{ m}^2/\text{s}$ for iodide and $1.3\text{-}1.8 \times 10^{-13} \text{ m}^2/\text{s}$ for tritiated water. Electrical resistivity measurements in salt water saturated rock cores have been performed. The resistivity is measured in the saturated core and in the salt solution with which the core has been saturated. The ratio between these two resistivities has a direct relation to the ratio of the effective diffusivity for a component in the rock material and the diffusivity in free water for the same component. (8 refs.)

60299 Diffusion in the matrix of granitic rock. Field test in the Stripa mine. L.Birgersson, I.Neretnieks (Dept. of Chem. Engng., Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.519-28

A migration experiment with the objective to investigate the existence of a connected pore system in 'undisturbed' rock has been performed in the Stripa mine at the 360 m-level. Since all three tracers (Cr-EDTA, I^- and Uranine) that were used in the experiment migrated at least 11 cm into the rock under a three month period, this experiment indicates the existence of a connected pore system in 'undisturbed' rock. (9 refs.)

60300 Migration in a single fracture. H.Abelin, J.Gidlund, I.Neretnieks (Dept. of Chem. Engng., Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.529-38

It has been decided to investigate flow and sorption in a readily identifiable fracture which can be excavated for a detailed examination of flow path and sorption sites. The investigation is performed in the Stripa mine, 360 m below ground, where there is a natural flow towards the drift. The bedrock is granite. A method of tracer injection into a fracture, either as a step or a pulse, and of collection of water samples under anoxic atmosphere has been suggested and tested in a preparatory investigation. The introduction of tracers can be done either under natural pressure or by injection with over pressure. An injection of Rhodamine-WT, Na-iodide and Na-fluorescein with cover pressure has been performed. It has been found that Rhodamine-WT is influenced in some way along the flow path. (5 refs.)

60301 Model for near field migration. G.Andersson, A.Rasmuson, I.Neretnieks (Dept. of Chem. Engng., Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.539-48

A model is proposed which describes the transport to and from a waste canister in a repository. The model includes flow and diffusion in the fractures in the bedrock as well as diffusion in the backfill. Calculations have been made on the inward transport of corrosive agents to a buried canister from the surrounding bedrock. The oxidants are transported from the flowing groundwater through the backfill to the surface of the canister, were they are assumed to react instantaneously with the canister material. The rock is modeled as a discrete fracture system. The fractures are assumed to be evenly spaced and the groundwater movement is described by potential flow. The model is three dimensional. (9 refs.)

60302 Model for far field migration. A.Rasmuson, I.Neretnieks (Dept. of Chem. Engng., Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.549-58

A transport model of radionuclide migration in fissured rock is presented. It includes advection and hydrodynamic dispersion in the fissures and diffusion and sorption in the rock blocks. 1 and 2D analytical and 3D numerical solutions of the model have been developed. A large number of calculations for the approximate range of variation of the input parameters have been performed. A large impact of hydrodynamic dispersion and micropore diffusion on the amount of radioactive material reaching the biosphere is found. (17 refs.)

60303 Leach rates of high level waste and spent fuel: limiting rates as determined by backfill and bedrock conditions. I.Neretnieks (Dept. of Chem. Engng., Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.559-68

The release rate of radionuclides from a degraded canister containing radioactive waste is controlled by diffusion through the backfill and by diffusion into the water flowing past the canister. In low porosity low permeability bedrock like the Swedish granites the amount of water which can be contaminated may be very small. Two sample cases are calculated. One uses the conditions for a repository for vitrified high level waste, the other applied to a repository for spent fuel. The small amount of water which can carry the waste in combination with the low solubilities for the major longlived actinides limit the release rate from the repositories to very small values. (12 refs.)

60304 Aqueous phase diffusion in crystalline rock. M.H.Bradbury, D.Lever, D.Kinsey (Harwell Labs, Harwell, England).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.569-78

One of the options being considered for the disposal of radioactive waste is deep burial in crystalline rocks such as granite. Recent theoretical studies have indicated the importance of diffusion into pores and micro-fissures in the rock matrix as an additional retardation and dispersion mechanism, particularly for species only weakly sorbed. This would delay the migration of radionuclides moving with the groundwater along major fissures or fractures. Because of the potential importance of this mechanism in radionuclide migration, a programme was started to measure diffusion coefficients of soluble species in water through rock. Diffusion coefficients have been measured in a number of granites, as a typical rock, using the very weakly sorbed iodide ion as tracer. In addition, measurements on weakly sorbed nuclides have yielded values of the sorption coefficient where other techniques are inadequate. (9 refs.)

60305 Permeability monitoring technique of the near-field and far-field interface of underground openings. A.T.Jakubick, V.De Korompay (Ontario Hydro, Toronto, Ontario, Canada).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.579-86

In July/August 1981 and February/March 1982 the authors sampled water for isotope analysis from water-bearing fractures of two mines in Elliot Lake. Permission for sampling was given to Ontario Hydro by Denison Mines Ltd. and Rio Algom Ltd., Quirke Mine in conjunction with the CANMET mine safety tests. The purpose of the investigation was to find out whether there is a relationship between the water present in some fractures in a deep mine and the shallow groundwater in the far-field of the mine. ^{18}O and ^2H contents are analysed. (11 refs.)

60306 Hydrothermal conditions around a radioactive waste repository. R.Thunvik, C.Braester (Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.587-95

The possibility of permanent burial of radioactive waste from nuclear power plants, is studied in Sweden at the KBS (Nuclear Fuel Safety)—project. Definite repository sites have not yet been selected, but the general principles of construction regarding the layout have been devised. The feasibility of a prospective site for radioactive waste disposal is highly dependent on the geohydrological conditions. Heat emitted by the decaying waste will increase the temperature of the rock, changing groundwater density gradients and creating convective currents. Under certain conditions water particles passing through the repository may reach the ground surface. It is therefore of significant interest in the safety analysis to predict pathlines and travel times of water particles, should any of the waste canisters be breached and the groundwater be contaminated. The solutions presented illustrate the effect of heat released from a hypothetical repository on the groundwater movements around the repository. (6 refs.)

60307 Modeling approach to determine short- and long-term thermal and thermomechanical effects of waste emplacement in a repository in basalt. T.F.Lehnhoff (Univ. of Missouri-Rolla, Rolla, MO, USA), K.Thirumalai, A.D.Krug.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.597-609

The Columbia River basalts, which underlie a large portion of the Pacific Northwest of the United States of America, are being investigated as one of the candidate media for a nuclear waste repository. The Basalt Waste Isolation Project of Rockwell Hanford Operations (Rockwell) is conducting these investigations for the US Department of Energy. Since the inception of the program in 1976, a number of studies have led to the selection of a reference repository location and the start of construction of an exploratory shaft. Near- and far-field effects are discussed here for thermal and thermomechanical properties in a basalt repository. (3 refs.)

60308 A combined analytical model for performance assessment of the waste package/geologic medium systems. A.K.Rays (Dept. of Chem. Engng., Univ. of Kentucky, Lexington, KY, USA), S.Nair, H.E.Nuttall.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.611-18

The authors have developed a three dimensional model which incorporates the sequence of events preceding migration of nuclides to biosphere. (7 refs.)

60309 Engineered components for spent fuel radioactive waste isolation. H.C.Burkholder (Battelle Memorial Inst., Office of Nuclear Waste Isolation, Columbus, OH, USA).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.619-30

In response to draft radioactive waste disposal standards, R&D programs have been initiated in the United States which are aimed at developing and ultimately using radionuclide transport-delaying (e.g., long-lived waste containers) and radionuclide transport-controlling (e.g., very low release rate waste forms) engineered components as part of the isolation system. Before these programs proceed significantly, it seems prudent to evaluate the techni-

cal justification for development and use of sophisticated engineered components in radioactive waste isolation. (27 refs.)

60310 Recent advances in repository seal materials. D.M.Roy (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA), F.L.Burns. Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.631-9

One long-term solution proposed for isolating radioactive waste from the biosphere is containment in underground geologic repositories. A requirement for this procedure is that most penetrations into the repository region be sealed following emplacement of the waste. The general requirements of repository seal materials and the seal system are that these potential pathways to the biosphere be sealed adequately to prevent (a) excess fluid flow into the repository and (b) radionuclides in the waste from reaching the biosphere in quantities in excess of acceptable levels. Here the authors report mostly on cementitious seal materials, with some studies of clays and zeolites. (18 refs.)

60311 Development of a backfill for containment of high-level nuclear waste. F.N.Hodges, J.H.Westik, Jr., L.A.Bray (Pacific Northwest Lab., Richland, WA, USA).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.641-8

Sodium and calcium bentonites, pressed to densities between 1.9 and 2.2 g/cm³, have hydraulic conductivities in the range of 10⁻¹¹ to 10⁻¹³ cm/s. Batch sorption distribution ratios (R_d) indicate that Sr, Cs, and Am are strongly sorbed on bentonites and zeolites, that Np and U are moderately sorbed on bentonites and zeolites, and that Am, Np, U, I, and Tc are strongly sorbed on charcoal. Sorption results with basalt and tuff ground waters are similar; however, iodine in tuff ground water sorbs more strongly on bentonites. Thermal diffusivity measurements for dry, compacted ($\rho \sim 2.1$ g/cm³) sodium bentonite indicate that the thermal conductivity of a high density bentonite backfill should be roughly similar to that of silicate host rocks (basalt, granite, tuff). These results indicate that a bentonite backfill can significantly delay the first release of many radionuclides into the host rock and that by forming a diffusion barrier a bentonite backfill can significantly decrease the long-term release rate of radionuclides from the waste package. (10 refs.)

60312 Ion water migration phenomena in dense bentonites. R.Pusch (Div. of Soil Mech., Univ. of Lulea, Lulea, Sweden), T.Eriksen, A.Jacobsson. Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.649-58

The development of a suitable technique for isolating unprocessed nuclear reactor wastes from the biosphere has led to the Swedish multibarrier concept KBS 2 with two engineered components, a thick-walled copper canister and a clay body which confines the canister. The clay consists of well fitting blocks of highly compacted Na bentonite made by 'isostatic' compression of bentonite powder. They are not water saturated when placed in the deposition holes but take up water from the surrounding rock, swell and ultimately form a tight contact with the rock and the canisters. When the bentonite is in physical equilibrium with the surroundings it from a medium with a number of valuable properties, such as self-healing and ion exchange capacities. The healing means that initial joints between blocks and voids, or local passages in the clay caused by slight rock or canister displacements, will be sealed by the swelling potential of the clay. The high ion exchange capacity retards the migration of radionuclides through the clay barrier after corrosion of the canisters. The most important feature is, however, the very low hydraulic conductivity and the low ion diffusivity. (6 refs.)

60313 Transport of actinides through a bentonite backfill. B.Torstenfelt, H.Kipatsi, K.Andersson, B.Allard, U.Olofsson (Dept. of Nuclear Chem., Chalmers Univ. of Technol., Goteborg, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.659-68

Compacted bentonite has been proposed as a suitable backfill material in the Swedish concept for underground storage of high-level waste. The backfill barrier will serve both as a physical barrier, preventing convective water flow and allowing radionuclide penetration only by diffusion, and as a chemical barrier capable of chemically interacting with the radionuclides. The authors present measurements of the diffusion and sorption of actinides in bentonite and the technique used for these studies. (14 refs.)

60314 Evaluation of solubility and speciation of actinides in natural groundwaters. M.R.Schweingruber (Swiss Federal Inst. for Reactor Res., Wurenlingen, Switzerland).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.679-88

Summarizes first modeling efforts undertaken to evaluate the speciation and solubility of U, Th, Np and Pu in two selected Swiss groundwaters. Starting from a rather general box model, two simple case studies will be defined. The first could be visualized as pertaining to the far-field, the second to the near-field of a repository. For both cases the required model parameters are specified. Some emphasis is laid upon the effect of kinetically hindered solid phase precipitation. (17 refs.)

60315 Study of radionuclide migration from deep-lying repository sites with overlying sedimentary layers. J.Hadernann, F.Roesel (Swiss Federal Inst. for Reactor Res., Wurenlingen, Switzerland).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.689-96

In Switzerland the host rock formations currently considered for disposal of high-level wastes lie in the northern part of the country. They form the crystalline basement and are covered by substantial layers of sedimentary rocks. First predictions of regional groundwater flow fields for this hydrologic system have become available recently. These define preferential migration paths to the biosphere and groundwater velocities to be used as input to radionuclide transport model calculations. The authors consider a one-dimensional transport along these preferential paths from a source described by a leaching model. The source is located at notional repository depths of 1500 and 2400 meters, respectively. In each case the depth in granitic rock is 1000 meters. As a source inventory they have chosen the ²⁴³Cm chain because it includes the nuclide ²³⁷Np which appears to be crucial in long-term

safety analyses. As far as possible field and laboratory data are used in the calculations. (7 refs.)

60316 A comparison of in-situ radionuclide migration studies in the Studsvik area and laboratory measurements. O.Landstrom (Studsvik Energiteknik, Nykoping, Sweden), C.E.Klockars, O.Persson, K.Andersson, B.Torstenfelt, B.Allard, S.A.Larsson, E.L.Tullborg.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.697-706

A series of in-situ radionuclide migration tests are in progress in the Studsvik area on the Swedish east coast. Three well defined flowpaths have been located and characterized using non-sorbing tracers (I-131 and H-3), and one of these pathways has been used for a study of the migration of sorbing elements (Sr-85). Laboratory sorption studies with Sr-85 have been performed on materials (rock-water) from the same location as the field tests and with variation of parameters not easily varied in-situ (e.g. pH and nuclide concentration). A fairly good correlation was obtained between retention in natural fractures (field experiment) and laboratory column studies, although the latter were formed on crushed samples of whole rock (retention factors 15-30). (14 refs.)

60317 Radionuclide retardation and release rates for oceanic sediments and clay. F.Schreiner, S.Fried, A.Friedman (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.707-14

The concept of emplacing nuclear waste in the argillaceous sediments covering extensive regions of the ocean floor is being given serious consideration by a group of interested nations. For such a subseabed repository to be acceptable the effectiveness in isolating the radioactive material must be demonstrated. Since the waste form cannot be relied upon to retain its integrity in the suboceanic environment, the subseabed repository relies principally on the containment qualities of the sediment that forms the geologic barrier impeding the spread of radionuclides. For the past several years the authors' laboratory has been engaged in the measurement of the parameters that characterize the mobility of actinide element ions and other radioactive species in marine sediments and in terrestrial clay. As a result of this work the authors are able to present convincing evidence showing the sediment to represent an adequate barrier for the isolation of nuclear wastes. (5 refs.)

60318 Liquid chromatography in migration studies. L.Carlsen, W.Batsberg (Chem. Dept., Riso Nat. Lab., Roskilde, Denmark).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.715-23

A detailed knowledge of the geochemical environment of a site for the disposal of radioactive waste is of fundamental importance. To evaluate the migration behaviour of radionuclides in geological media a series of data are needed, amongst others a number of physico-chemical properties of the media, such as permeability, porosity, dispersion, diffusion, and sorption characteristics. In this connection liquid chromatography appears to be advantageous as a facile experimental technique to obtain relevant data for these physico-chemical properties. The capabilities of the liquid chromatography technique in connection with migration studies are illustrated by examples from recent studies on the cretaceous formation overlying the Erslev salt dome (North Jutland, Denmark). (11 refs.)

60319 Studies of the mobilization of thorium from the Morro do Ferro. M.Eisenbud, W.Lei, R.Ballad (New York Univ. Medical Center, New York, NY, USA), E.Penna Franca, N.Mickeyley, T.Cullen, K.Krauskopf.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.735-44

The studies have three objectives: (1) to predict by analogy with the thorium deposit, the environmental implications of an ancient residue of plutonium in a nuclear waste repository that has been eroded to the surface or has been subject to groundwater intrusion; (2) to develop models for transport of Th, U, Ra-226, Ra-228, rare earths, and possibly other elements; and (3) to evaluate the dosimetric implications to human living near the site. This is a progress report that will be limited to the findings with respect to the first objective, the use of this plutonium analogue to predict the environmental implications of a nuclear waste repository that has been breached. (13 refs.)

60320 Properties and mobilities of actinide colloids in geologic systems. U.Olofsson, B.Allard, B.Torstenfelt, K.Andersson (Dept. of Nuclear Chem., Chalmers Univ. of Technol., Goteborg, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.755-64

The interaction between radionuclides in solution and exposed geologic media, e.g. in connection with underground storage of radioactive waste, is largely determined by the chemical properties of the system. The mobility of radionuclides in contact with low-capacity minerals would depend on the chemical state of the element (e.g. degree of hydrolysis, formation of organic and inorganic complexes, etc.). Particularly for the actinides in their lower oxidation states (III, IV), however, would a formation of colloid particles be feasible in the groundwater environment. These colloids could be either true radiocolloids, i.e. aggregates of the radionuclide itself, or pseudocolloids, i.e. colloid material already present in the groundwater, onto which the radionuclide has sorbed. These colloidal particles may be very poorly sorbed on water exposed geologic media in comparison with radionuclides in true solution. Studies on the formation and properties of some actinide colloids (Am, Np, Pu) are discussed. (8 refs.)

60321 The migration of radionuclides with ground water. A discussion of the relevance of the input parameters used in model calculations. B.S.Jensen (Dept. of Chem., Riso Nat. Lab., Roskilde, Denmark).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.765-74

The plans for the disposal of radioactive waste leave very little time for testing long term performance of a repository so the evaluation of the hazards involved in the operation relies heavily on model calculations. It is therefore of utmost importance that these model calculations take all important parameters into account and are based on a thorough understanding of the possible physical and chemical processes in which the migrating species take

part. The author discusses many of the geophysical and geochemical processes in which migrating species can take part. (6 refs.)

60322 Sorption of actinides in well-defined oxidation states on geologic media. B. Allard, U. Olofsson, B. Torstenfeld, H. Kipatsi, K. Andersson (Dept. of Nuclear Chem., Chalmers Univ. of Technol., Göteborg, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.775-82

The purpose of the present study is to get information on the mechanisms of actinide sorption on geologic material under well-defined conditions and using actinides in discrete oxidation states. For americium, the only oxidation state, that would be obtained under oxic conditions and in the absence of strong complexing agents, would be the trivalent state. For thorium, only the tetravalent state would exist in aqueous solution. Under oxic conditions and in the pH-range of environmental interest neptunium and uranium would exist entirely as penta- and hexavalent species, respectively, in solution. By performing experiments under oxic conditions Am(III), Th(IV), Np(V) and U(VI) would be obtained purely in one single oxidation state without any rigorous control of the redox potential. Thus, they may serve as reference systems. Hereby, it is possible to illustrate the importance of characterizing the redox properties of e.g. a potential geologic repository site and the effect of a sudden change of the pH or redox potential on the retention of a specific actinide. (9 refs.)

60323 Laboratory tests on the migration behavior of selected fission products in aquifer materials from a potential disposal site in northern Germany. H. Behrens, D. Klotz, H. Lang, H. Moser (Inst. für Radiohydrometrie, Gesellschaft für Strahlen- und Umweltforschung mbH München, Neuherberg, Germany), G. Barke, H. Bruhl, S. Gehler, U. Mühlenweg.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.783-90

The migration behaviour with respect to retardation by sorption of radioactive Ce, Cs, I, Nb, Ru, Sm, Sr, Te and Zr in fluvialite and aeolian sand aquifers has been examined in laboratory tests. In these tests it was attempted to simulate the natural conditions of the field. The tests were performed as batch and column experiments. The results of both types of experimental procedures agree within the error limits and show small sorption for I^- and TeO_4^{2-} ; medium sorption for Sr^{2+} , and high sorption for Cs^+ , Ce^{3+} , Sm^{3+} , Ru^{4+} , Zr^{4+} and Nb^{5+} . The investigations will be continued with other geologic materials from the same site. (5 refs.)

60324 Modelling of the migration of lanthanoids and actinoids in ground water; the medium dependence of equilibrium constants. G. Biedermann, J. Gruno, D. Ferri, I. Grenthe, F. Salvatore, K. Spahiu (Dept. of Inorganic Chem., Royal Inst. of Technol., Stockholm, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.791-800 (14 refs.)

60325 Evaluation of radionuclide transport: effect of radionuclide sorption and solubility. P.F. Salter, G.K. Jacobs (Basalt Waste Isolation Project, Rockwell Hanford Operations, Richland, WA, USA).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.801-10

The sorption and solubility behavior of several potentially hazardous (key) radionuclides in the Columbia River Basalt geohydrologic system is discussed. Utilizing the transport characteristics of the site and the available sorption and solubility data, a preliminary site performance analysis is performed through comparison of the resultant predicted radionuclide transport behaviour with proposed US environmental regulations. (18 refs.)

60326 Radionuclide retardation during transport through fractured granite. I.G. McKinley, J.M. West (Inst. of Geological Sci., AERE Harwell, Didcot, England).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.811-20

The results of laboratory sorption studies of particular radionuclides (isotopes of Cs, Sr, Co and Ce) onto naturally weathered granite fracture infill are reported. Complementary mechanistic studies investigating the effect of reaction direction, temperature and competing ions on sorption isotherms are also briefly summarised. By use of simple computer models of groundwater flow, the consequences of observed 'isotherm non-linearity' on resultant nuclide migration are illustrative and compared with retardation calculated assuming 'matrix-diffusion' effects. (7 refs.)

60327 A comparative analysis of fractured and porous medium radionuclide transport. B.J. Travis (Earth & Space Sci. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), H.E. Nuttall.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.821-30

Provides a comparative study of porous and fractured medium nuclide transport by modeling the far field (1 km) problem for three different types of geomedia, i.e. a homogeneous porous medium, a single fracture in the porous medium, and a multi-fracture medium. Analytical models were used to study the homogeneous and single fracture geometries while an advanced numerical code was used to model the multi-fractured medium. (7 refs.)

60329 Fuel cycle costs for molten-salt reactors. K. Nagashima (Sumitomo Atomic Energy Industries Ltd., Osaka, Japan).

J. At. Energy Soc. Jpn. (Japan), vol.25, no.1, p.49-57 (Jan. 1983). In Japanese.

The report describes FCC (fuel cycle cost) estimates for MSCR (molten-salt converter reactor) and MSBR (molten-salt breeder reactor) compared with those for LWRs (PWR and BWR). The calculation is based on the present worth technique with a given discount rate for each item, which enables one to make comparison between FCCs for MSCR, MSBR and LWRs. It is shown that the FCCs for MSCR and MSBR are 70~60% lower than the values for LWRs. And it could be said that the FCC for MSCR (Pu-converter) is about 10% lower than that for MSBR, because of the smaller amount of fissile inventory of MSCR than the inventory of MSBR. (10 refs.)

60330 Canadian accelerator breeder system development. S.O. Schriber. Report AECL-7840, Atomic Energy Canada Ltd., Chalk River, Ont. (Nov. 1982), 25 pp.

A shortage of fissile material at a reasonable price is expected to occur in the early part of the twenty-first century. Converting fertile material to fissile material by electronuclear methods is an option that can extend the world's resources of fissionable material, supplying fuel for nuclear power stations. This paper presents the rationale for electronuclear breeders and describes the Canadian development program for an accelerator breeder facility that could produce 1 Mg of fissile material per year. (7 refs.)

60331 After Creys-Malville: the prospects for the integrated site. C. Aycober, J. Leclercq (COGEMA, Cherbourg, France).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.155-73 In French.

The integrated site concept is defined as the juxtaposition of fuel element manufacture and reprocess plant with the nuclear reactor and turbo-generator halls, which is considered to be particularly advantageous following the development of fast reactors. A description is given of the project 'RAPIDE 1500 MW'. A 3600 MW (thermal) unit caters for the movement of 470 elements per year to and from a parallelepiped-shaped common vault. Details are given of the fuel fabrication process, which includes the stages of plutonium and uranium oxide grinding, mixing and calcining. Other plant items on the same site are the fuel and liquid waste reprocessing units. The reprocessing is divided into spent fuel treatment cycles for plutonium oxide, uranium nitrate, liquified waste and vitrified solid waste. (no refs.) G.C.

28.43 FISSION REACTOR OPERATION

60332 Automatic time differential boiler leak location system. J.C.P. Garrett, G.D. Hall (Sci. Services Dept., CEGB, Manchester, England). *CEGB Tech. Disclosure Bull. (GB)*, no. 380, 4 pp. (Jan. 1983). A time differential technique is described for boiler leak location for gas cooled nuclear reactors. The principle of operation is based on common-mode rejection utilising commercial moisture measuring equipment, gas sampling valves and a microprocessor. The technique can be applied in principle to other online processes. (no refs.)

60333 A study of reactor internal dynamics by reactor noise analysis. Hee-Young Chun, Byoung-Joon Koh, Kyun-Kook Shin (Korean Inst. Electrical Engrs., Seoul, Korea). *Trans. Korean Inst. Electr. Eng.*, vol. 31, no. 10, p. 109-15 (1982). In Korean. At the TRIGA MARK II reactor whose rated power is 250 kW thermal, the power spectral densities of the noise were measured by a stochastic method with high resolution digital filters and fast Fourier transforms. The transfer function of the reactor at zero power was identical to the theoretical characteristics. When the power was increased above 1 kW, it showed power resonances at 3 Hz and 10 Hz generated by heat transfer and coolant flow effects and by nuclear reaction effects, respectively. (14 refs.)

60334 Recovery of hydrogen isotopes using a uranium bed. T. Tanabe, T. Yamamoto, S. Imoto (Dept. of Nuclear Engng., Osaka Univ., Osaka, Japan).

J. Less-Common Met. (Switzerland), vol. 89, no. 2, p. 393-8 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982). A breakthrough experiment was used to investigate the recovery of hydrogen isotopes from contaminated inert gases by using a reactive uranium powder bed column under various conditions. Before the break point, the partial pressure of hydrogen in the outlet gas is almost equal to the plateau pressure of UH_3 at the column temperature. The breakthrough curve can be described by Meinschein's gas phase mass-transfer-limited model. The column is still effective at 273K where the partial pressure of hydrogen at the outlet is 10^{-5} Pa. (9 refs.)

60335 Filter for the selective removal of tritium from the coolant gas of a high temperature nuclear reactor. N. Iniotakis, W. Frohling, C.B. von der Decken (KFA Jülich, Jülich, Germany). *J. Less-Common Met. (Switzerland)*, vol. 89, no. 2, p. 465-74 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982). A filter for the selective and continuous removal of tritium or deuterium from an inert gas stream is proposed. It is based on the permeation of hydrogen and its isotopes through a highly permeable wall and the removal of for example tritium on the secondary side. The necessary concentration drop to the secondary side is effected by isotope exchange of the tritium atoms on the secondary side with water. The filter concept and the mathematical model, investigations of the influence of various parameters and the selection of the wall material are reported. (2 refs.)

60336 Reactor physics constants for the medium enriched-uranium core of Kyoto University Critical Assembly. S. Wakamatsu, K. Nishina (Dept. of Nuclear Engng., Nagoya Univ., Nagoya, Japan). *Mem. Fac. Eng. Nagoya Univ. (Japan)*, vol. 34, no. 1, p. 125-38 (May 1982). In English. [received: March 1983]

Two energy-group eleven-region constants are determined for the single cylindrical core of the Kyoto University Critical Assembly (KUCA) loaded with uranium fuel of forty-five per cent enrichment. The procedure is based on the twenty-six group microscopic cross section libraries MGCL26GR and SMF26GR as its starting point, and on flux calculations by the one-dimensional transport theory code ANISN-JR. Cross sections are averaged with these fluxes as weighting functions. Although the constants do not produce complete agreement with experiment when used for criticality calculations, they are given as a form of an interim report. For the various analyses of the experiment being conducted at KUCA, only a relatively simple form of the constants is needed. Because of its complicated fuel-region geometry however, repeated spectrum calculations are required. (23 refs.)

60337 Prospekt-1 program for recovering the neutron spectra of nuclear reactors. V.M. Bukhshtaber, E.I. Grigor'ev, V.G. Markin, G.V. Tarnovskii, V.P. Yaryna.

Meas. Tech. (USA), vol. 25, no. 7, p. 624-5 (July 1982). Translation of: *Izmer. Tekh. (USSR)*, vol. 25, no. 7, p. 62-3 (July 1982). [received: Feb. 1983] The Prospekt-1 method is the first stage in the creation of an up-to-date program for recovering the spectra of nuclear reactors over a wide energy range. It provides a very detailed characterization of the neutron distribution, viz. the differential neutron flux density $\phi(E)$ as a function of the energy E (neutron spectrum) in the range 0.5 eV-18 MeV. The Prospekt-1 program has been realized with the ES computers. The minimum configuration is a central processor with not less than 256 bytes of executive memory, the OS ES operating system, and three ES-5052 disk stores, including those necessary for operation of the OS ES system. The program has been written in PL/I. The run time with an ES 1033 is 6-12 min in accordance with the composition of the initial data. (8 refs.)

60338 BWR refill-reflood program constitutive correlations for shear and heat transfer for the BWR version of TRAC. J.G.M. Andersen, K.H. Chu. *Report EPRI-NP-1582*, Electr. Power Res. Inst., Palo Alto, CA, USA (Jan. 1983). 100 pp. Contract NUREG/CR-2134 GEAP-24940. Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Describes the constitutive correlations for shear and heat transfer in the BWR version of the transient reactor analysis code which is a computer code for best-estimate analysis of the thermal-hydraulic conditions in a reactor system. Basic equations are presented as well as a discussion of interfacial shear and wall friction.

60339 NATBWR: A steady-state model for natural circulation in boiling water reactors. J.M. Heazler, D. Abdollahian. *Report EPRI-NP-2856-CCM*, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983). 168 pp. Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Documents the NATBWR steady-state BWR natural circulation model and data gathered to predict and benchmark the natural circulation operation of the BWR. The NATBWR model is described, together with its applications to available BWR natural circulation data; user and programming information about the model is also provided. The available natural circulation data of five different operating BWRs are compared to model predictions, and the behavior of the BWR system at reduced inventory is analyzed.

60340 Cleaning steam generators off-line (soaking) with chelants. R.G. Charles, J.G. Cleary. *Report EPRI-NP-2815*, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983). 236 pp. Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Provides a detailed description of laboratory testing conducted to determine the feasibility of using organic chelating agents in an off-line soak mode of application to arrest denting corrosion in steam generators. Several unique laboratory techniques for determining chelant thermal stability, chelant reaction rates with magnetite, and chelant corrosivity toward carbon steel structural materials are also discussed.

60341 Eddy-current NDE for intergranular attack. *Report EPRI-NP-2862*, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983). 118 pp. Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Details one of a series of projects to develop nondestructive examination methods, focusing on improved eddy-current inspection methods for detecting and characterizing intergranular attack in steam generator tubing. Metallographic and eddy-current data on 30 removed tubes from three operating plants are reviewed, and laboratory analysis of the eddy-current data is discussed to define the capabilities of various techniques used in the field inspection.

60342 Thermal-hydraulic code qualification: ATHOS2 and data from Bugey 4 and Tricastin 1. P.J. Masiello. *Report EPRI-NP-2872*, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983). 124 pp. Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.

Describes the use of measured data from steam generators at Bugey 4 and Tricastin 1 nuclear power plants in the qualification of the ATHOS2 computer code, a three-dimensional, two-phase thermal-hydraulic code for the steady-state and transient analysis of recirculating-type steam generators. Comparison cases, including steady-state-conditions at various power levels, are presented, and the study parameters of circulation ratio and temperature distribution across the tubesheet are discussed.

60343 Dual-process. A highly reliable process control system. L. Burger, A. Gossanyi, T. Parkanyi, G. Szabo, E. Vegh. *Report KFKI-1983-08*, Hungarian Acad. Sci., Budapest (1983). 34 pp.

A multiprocessor process control system is described. During its development the reliability was the most important aspect because it is used in the computerized control of a 5 MW research reactor. DUAL-PROCESS is fully compatible with the earlier single processor control system PROCESS-24K. The paper deals in detail with the communication, synchronisation, error detection and error recovery problems of the operating system. (5 refs.)

60344 Fast breeder nuclear boiler with heat carrying liquid metal. Preliminary study of the abolition of the secondary sodium circuit. P. Petraud, J.L. Quinot, A. Villemeur (Res. & Dev. Div., Electricite de France, Chateau, France).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p. 201-11 vol. 3. Reports a preliminary study of double wall tube steam generators, which do away with the need for an intermediate cooling system in FBRs. This type of steam generator is described briefly and two safety requirements are examined in detail. These are the probability of a major water leak and the impact of a sodium-water reaction following a leak. Preliminary results, which require a more thorough confirmation, show a good safety margin. (5 refs.)

60345 A synthesis of ten years' tests on scale models of LMFBR steam generators at the CGVS facility. J.P. Fontaine, J.L. Quinot (Direction des Etudes et Recherches, Electricite de France, Chateau, France). Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p. 213-21 vol. 3.

Discusses experiments on a high power sodium heated SG facility (CGVS), capable of reproducing all possible operating conditions, to study the behaviour of scale-models of industrial apparatus. Four 45 MW test-SG were studied. The main findings of these experiments were as follows: heat exchange surfaces remained perfectly leakproof; hydrogen detection in the sodium and argon constitute additional systems for monitoring the impermeability to leaks of a SG with a free sodium surface; extrapolation of the findings to the SUPER PHENIX SG shows that water leaking at a rate of 100 mg/s would induce in ten minutes a 50% rise of the signal produced by the hydrogen monitoring device in the sodium; acoustic method can detect leaks of the order of one g/s in a 45 MW SG sited in an industrial environment. (5 refs.)

60346 Evaluation of angle transducers for a high performance manipulator. R.C. Holt (Marchwood Engng. Labs., CEGB, Marchwood, England). Colloquium on 'Axes Measurement Systems for Robots, Manipulators and other NC Devices', London, England, 2 March 1983 (London, England: IEE 1983). 3 pp.

Future repair tasks inside CEGB reactors will almost certainly involve welding and an advanced manipulator is being developed for this purpose. In order to weld successfully a manipulator must control its 'end effector' to within about 0.5 mm. One restriction which prohibits the use of commercial welding robots is that access to a reactor is through a 200 mm diameter hole. When evaluating angle transducers it is important to distinguish between resolution, accuracy and repeatability. (no refs.)

28.44 FISSION REACTOR PROTECTION SYSTEMS, SAFETY AND ACCIDENTS

- 60347 Method of developing reliable software for computer-assisted safety systems.** H.Trauboth, U.Voges (Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany). *Atomwirtsch.-Atomtech. (Germany)*, vol.28, no.1, p.43-8 (Jan. 1983). In German.
- A reactor protection system as part of the safety system is functionally separated from the control system and is intended, in dangerous situations, to transfer the reactor into a safe state as quickly as possible and without causing any damage to persons or the plant. Until now, this scram has been initiated abruptly, shutting the reactor down completely. Since any scram and subsequent restarting subjects the reactor to major stresses the number of such 'hard' scrams should be minimized. For this purpose, the short-term protection system should be added to an early warning and fault diagnosing system. This improved transparency of the operating processes allows the plant personnel to initiate specific corrections and, for instance, run the plant at a reduced power level or shut it down 'softly', i.e. in steps. This intelligent mode of control needs more capable software, the development and structure of which is outlined in this article. (16 refs.)
- 60348 Assessing the availability of nuclear power plants.** U.Hansen (Univ. Essen-GHS, Essen, Germany). *Atomwirtsch.-Atomtech. (Germany)*, vol.28, no.4, p.184-5 (April 1983). In German.
- Outages of nuclear power plants are due to many causes. However, frequently the origins are minor, harmless events which would have permitted conventional power plants to go on, whereas nuclear power plants are required to cease operation until another absolutely reliable proof of safety has been produced. This also reflects in the statistics of plant availability. Differences in the availabilities of competing systems also affect their relative economics. Power plants suffering from occasional outages need standby capacity to be maintained, and potential effects on the overall system must be taken into account in investment decisions. An approach is outlined in this article in which differences in availability are considered as internal costs of the respective types of power plants. (6 refs.)
- 60349 The hydrogen problem.** H.Karwat (Tech. Univ., Munchen, Garching, Germany). *Atomwirtsch.-Atomtech. (Germany)*, vol.28, no.4, p.186-8 (April 1983). In German.
- The possibility of larger quantities of hydrogen being generated from the metal-water vapor reaction at the elevated temperatures which can be expected to exist in water cooled reactors in the course of loss-of-coolant accidents was recognized already in the early technical development of nuclear power plants. Very early, reference was also made to the resultant consequences with respect to the maintenance of containment integrity. The criteria drafted for assessing the effectiveness of the emergency core cooling systems installed in all light water reactors centered around the fundamental idea of effectively excluding the onset of the strongly exothermic zircaloy-water vapor reaction as an additional heat source in the process of core heating. The whole complex of problems was regarded as solved—till the accident in the American TMI-2 nuclear power plant. After that accident, new countermeasures to control hydrogen in accidents were demanded especially in the United States. In the Federal Republic of Germany and in France the American approach has not been followed so far. Instead, it is to be proved that the existing emergency cooling systems will ensure with sufficient reliability that hydrogen will not occur on the scale discussed. Avoiding the formation of hydrogen, and proving it, will help safety more than controlling the consequences of hydrogen generation by dubious means. (13 refs.)
- 60350 LOBI program—results of the first test phase (loss-of-coolant accidents).** W.L.Riebold, P.Mork-Morkenstein, L.Piplies, H.Stadtke (Kommission der Europäischen Gemeinschaften, Ispra/Varese, Italy). *Atomwirtsch.-Atomtech. (Germany)*, vol.28, no.4, p.196-202 (April 1983). In German.
- The LOBI Project is a large scale project in the field of reactor safety research currently implemented at the Euratom Joint Nuclear Research Establishment of Ispra, Italy, in a joint international effort by the Federal Ministry for Research and Technology (Federal Republic of Germany) and the Commission of the European Communities. It is concerned with investigations of assumed loss-of-coolant accidents in pressurized water reactors. For this purpose, the LOBI test facility was built, at present the only high pressure integral systems test facility in Europe. The experiments run in the A1 program phase on large breaks cover a wide spectrum of test parameters, e.g. break size (25 to 200%), break location (cold leg, hot leg, pump bend), and the type of emergency cooling water feed (cold leg, cold and hot legs combined, no feed). The sequence of accident events observed in the blowdown (high pressure) phase of the experiment was correctly described in advance calculations, both qualitatively and in most cases also quantitatively, when existing blowdown computer programs were applied correctly. The importance of the competence of the users of such computer programs is apparent from the large deviations in the computed results encountered in the LOBI PREX standard problem. (12 refs.)
- 60351 Safeguards and nuclear safety: a personal perspective.** L.M.Muntzing (American Nuclear Soc., La Grange Park, IL, USA). *Int. At. Energy Agency Bull. (Austria)*, vol.24, no.4, p.7-10 (Dec. 1982).
- Reviews the accomplishments, appraises the present status and sets out the imperatives for the future activities of the IAEA on its twenty-fifth anniversary. (no refs.)
- 60352 Study on the steam line break accident for Kori Unit-1.** Tae Woon Kim, Jung In Choi, Un Chul Lee (Seoul Nat. Univ., Seoul, Korea), Ki In Han. *J. Korean Nucl. Soc.*, vol.14, no.4, p.186-95 (Dec. 1982). [received: April 1983]
- A steam line break accident in Kori Unit 1 is analyzed by the SYSRAN code which calculates the nuclear power and heat flux using the point kinetics equation and the lumped-parameter model, and the system transients using the mass and energy balance equation with the assumption of uniform reactor

coolant system pressure. The accident is analyzed at the EOL (End of Life) hot shutdown condition in which case it would be severe. The steam discharge rate is assumed to follow the Moody critical flow model. The results reveal a peak heat flux of 38% of nominal full power value at 60 seconds after the accident initiates. A sensitivity study shows that this accident is very sensitive to the moderator density coefficient and the lower plenum mixing factor. The point kinetics equation, the lumped-parameter model and the system transient model are verified as effective to follow the system transient phenomena of nuclear power plants. (11 refs.)

60353 Description and discussion of the current state of the knowledge about the Leidenfrost phenomenon. Moon Ki Chung, Young Whan Lee (Korea Advanced Energy Res. Inst., Seoul, Korea). *J. Korean Nucl. Soc.*, vol.14, no.4, p.204-18 (Dec. 1982). [received: April 1983]

The authors describe and discuss the current state of the knowledge about the Leidenfrost phenomenon which is a heavily studied subject in the field of boiling heat transfer. The strong interest is due to reactor safety considerations since it is desirable to obtain a better understanding of the physical mechanisms involved in the rewetting of high temperature surface after a low coolant accident. A brief survey of theoretical and experimental results indicates that considerable discrepancy exists in the prediction of the Leidenfrost temperature at elevated pressures and more investigations are needed in this area. (40 refs.)

60354 How Inpo is helping to improve safety and reliability. R.L.Haueter, R.L.Simard, S.L.Rosen (Inpo, Atlanta, GA, USA). *Nucl. Eng. Int. (GB)*, vol.28, no.339, p.30-4 (April 1983).

About three-quarters of the world's operating reactors are now tied into data base programmes of the Institute of Nuclear Power Operations (Inpo) in the United States. The use and effectiveness of the programmes, which cover reliability data on systems and equipment, analysis of event reports and a computer conferencing system, are continuing to expand. (no refs.)

60355 An analysis of the hydrogen bubble concerns in the Three-Mile Island Unit-2 Reactor vessel. S.Gordon, K.H.Schmidt, J.R.Honekamp (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA). *Radiat. Phys. & Chem. (GB)*, vol.21, no.3, p.247-58 (1983).

On 30 March 1979, two days after the accident at the Three-Mile Island Reactor near Harrisburg, Pennsylvania, press reports appeared about a non-condensable bubble in the reactor vessel. This bubble was said to consist mainly of hydrogen, and to grow rapidly, possibly due to the development of oxygen. Danger of explosion was reported to be imminent. The authors analyzed all possible sources of noncondensable gases, including radiolysis, and determined that a continuing growth of the bubble during several days after the accident was not possible. Their main conclusions were the following: (1) Most of the initial hydrogen in the bubble was produced by the reaction of the Zircalloy cladding with the super-heated water. (2) During the first 16 hr after shutdown, when boiling of the primary coolant water took place, in the worst case stoichiometric amounts of hydrogen and oxygen could have been produced by radiolysis, leading to a maximum amount of oxygen in the bubble, of 0.7% of the hydrogen, which is well below the explosion limit. (3) After this 16 hr period, when boiling had totally ceased, no further oxygen could have been produced by radiolysis of the primary cooling water. On the contrary, oxygen was recombined with hydrogen due to radiolysis at such a rate that the oxygen in the water was completely removed in less than five minutes. The subsequent rate of removal of oxygen from the bubble by dissolution and radiolysis depended essentially on the rate of dissolution. (23 refs.)

60356 Radiolysis of iodine compounds in model systems of PWR. A.Habersbergerova, B.Bartonicek (Nuclear Res. Inst., Rez, Czechoslovakia). *Radiat. Phys. & Chem. (GB)*, vol.21, no.3, p.289-93 (1983).

The paper gives a survey of experimental results concerning the chemical behaviour and radiation chemical reactions of inorganic iodine compounds in a model WWER coolant, the reactions of iodine with methane taking place in the gas phase on irradiation and the radiolysis of inorganic iodine compounds as well as of CH_3I in the spray solutions. (22 refs.)

60357 Valve inlet fluid conditions for pressurizer safety and relief valves in Westinghouse-designed plants. A.Meliksetian, A.M.Sklencar. *Report EPRI-NP-2296*, Electr. Power Res. Inst., Palo Alto, CA, USA (Dec. 1982), 60 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. The expected range of fluid inlet conditions is presented for pressurizer safety and relief valves utilized in Westinghouse-designed PWR units. The conditions are determined based on consideration of FSAR, extended high-pressure liquid injection, and cold overpressurization events. The Westinghouse PWR units are grouped by design and layout; a reference plant is chosen for each group; and valve fluid inlet conditions, resulting from limited FSAR events, are determined for each reference plant.

60358 Analysis and synthesis of the theoretical studies performed on the control and safety of LWR's burning plutonium fuel. J.Basselier, A.Remard, R.Holzer, K.Hnilica, A.Charlier, C.Vandenberg, W.Fehrenbach.

Report EUR 8118 EN, Comm. European Communities, Luxembourg (1982), vi+338 pp. Contract 049-79 RPU-B 050-79 RPU-D.

The purpose of the work is to analyse and synthesise the theoretical studies performed on the control and the safety of LWR's burning plutonium fuel. These studies cover the following areas: the comparative investigations of parameters for plutonium fuelled power stations (PWR and BWR) under steady state and dynamic conditions for typical accidents. In each study, the same reactor fuelled only with uranium is taken as the standard reference; the handling and the storage of plutonium fuel assemblies.

60359 Scale modeling of turbine missile impact into concrete. S.McHugh, L.Seaman, Y.Gupta.

Report EPRI-NP-2746, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 160 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Results are presented of scale model turbine missile impact tests conducted as part of a program to provide data on the impact resistance of structures that protect safety-related equipment in nuclear power plants. The 1/11-scale-model experiments are studied, and the results are compared with two previously conducted full-scale tests. Details are also provided of the experimental method and components, symmetric missile tests, and finite difference computations of a missile impact.

60360 Postaccident decontamination of reactor primary systems and test loops. C.J.Card.

Report EPRI-NP-2842, Electr. Power Res. Inst., Palo Alto, CA, USA (Jan. 1983), 114 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Documents past decontamination efforts on reactor systems and test loops and relates this information to the decontamination of LWRs particularly that at Three Mile Island Unit-2. Emphasizing postaccident situations involving both

fission products and fuel debris, this report details decontamination experiences on four experimental reactors and eight test loops. Studies of the 12 chemical solutions used in the experiments are included.

60361 Scale model turbine missile casing impact tests. C.M.Romander, A.L.Florence.

Report EPRI-NP-2742, Electr. Power Res. Inst., Palo Alto, CA, USA (Jan. 1983), 112 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Describes three 1/5-scale model turbine missile impact experiments performed to provide benchmark data for assessing turbine missile effects in nuclear plant design. The development of an explosive launcher to accelerate the 1/5-scale models of a turbine missile to the desired impact velocities is described. Comparison of results with those of full-scale experiments demonstrates scalability.

60362 Monitoring system for determining air leakage and oxygen concentrations in the secondary cycle of pressurized water reactor plants. D.T.Snyder, J.Blok.

Report EPRI-NP-2865, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 120 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Details are provided on a dissolved gas analysis system developed for accurately determining the concentration of dissolved gases in condensate and feedwater process streams of PWRs in order to obtain improved diagnostic information on corrosion and corrosion-related phenomena in piping and system components. The design, calibration, and laboratory testing of the prototype dissolved-gas analyzer is documented, a series of gas and liquid measurements in an operating PWR is described, and detailed installation and operating instructions for the prototype instrument are included.

60363 Full-scale turbine missile concrete impact experiments. R.L.Woodfin.

Report EPRI-NP-2745, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 174 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Describes four full-scale rocket sled experiments conducted to provide data on the response of reinforced concrete containment walls to impact and penetration by turbine missiles. Variations in the missiles' mass, velocity, and attitude and the steel liner thickness are discussed, and the measures of damage are detailed, including penetration depth, crater volume, and rear face cracking. Test results are compared with existing empirical penetration formulas.

60364 Fire tests in ventilated rooms. Detection of cable tray and exposure fires. J.S.Newman.

Report EPRI-NP-2751, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 102 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Examines work to assess the response of typical commercial smoke detectors (ionisation and photoelectric types) to fires in ventilated rooms representative of utility environments. Detector response relationships are developed as a function of smoke transit time, detection time factor, detector sensitivity factor, ventilation factor, and nondimensional detector spacing. An example of detector spacing requirements is given based on results of cable tray fire tests in a ventilated environment.

60365 Assessment of chemical processes for the postaccident decontamination of reactor coolant systems. L.F.Munson, C.J.Card, J.R.Divine.

Report EPRI-NP-2866, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 270 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. The following topics were dealt with: the examination of previously used chemical decontamination processes and potentially useful new decontamination processes is discussed. Both generic fuel damage accidents and the accident at TMI-2 are considered, and a total of 14 processes are evaluated. Process evaluation includes data in the following categories: technical description of the process, recorded past usage, effectiveness, process limitation, safety consideration, and waste management.

60366 The role of carbon dioxide in the combustion of sodium in air. R.N.Newman (CEGB, Berkeley Nuclear Labs., Berkeley, England).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.3-11 vol.3

The nature of the sodium surface during sodium pool fires has been observed at varying temperatures. At temperatures below $\sim 600^\circ\text{C}$ the fuel is fed to small flame zones through wicks of sodium oxides. Above 600°C the oxides, which are more dense than sodium sink into the pool. The surface layer that supports these oxide wicks has been isolated, analyzed and found to contain carbon derived from reaction between the sodium and CO_2 . A sodium oxide catalysed oxidation of this carbon layer is suggested to explain its destruction. The influence of CO_2 was further investigated by studying the burning of sodium in CO_2 enriched atmospheres. The results are used to explain the effect of carbon containing extinguishants and ignition delays of split sodium. (7 refs.)

60367 Experimental studies on sodium columnar fire and pool fire. T.Sano, Y.Abe (Mitsubishi Heavy Industries Ltd., Takasago Tech. Inst., Hyogo, Japan), T.Kiyokawa.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.13-22 vol.3

Sodium columnar and pool fire tests were performed to ensure the integrity of a container cell and to examine quantitative aspects of sodium fire. Tests were carried out in an enclosed steel-lined concrete cell of 21 m^3 , which was filled with air or nitrogen gas, and into which 1 m^3 max. and 530°C max. sodium was spilled. To predict fire characteristics, a computer code for columnar and pool fire was developed and the calculations were compared with the experimental results. Many sodium fire tests demonstrated that the cell maintained its integrity. The computer code gave good agreement with most of the experimental data, except for the tests in which many fire spots existed on the surface of pool. (1 ref.)

60368 Sodium-water reaction in a non-confined medium. M.Amblard, G.Berthoud, A.Pion (CEN Grenoble, Grenoble, France), V.Lyaly, R.Sesny.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.23-31 vol.3

The sodium-liquid water reaction is studied experimentally in small-scale tests with the substances brought into contact in different modes, some fundamental, others more realistic, reproducing an accident scenario. The experiments are analysed by means of a thermohydraulic model taking hydrodynamic instabilities into account. (no refs.)

60369 The Brasimone sodium-water reaction test facility—test BA 12—pressure wave effects and steam generator tube bundle deformations following 'guillotine failure' of a tube. J.Biscarel, M.Hugla, C.Lorin, J.Raffailhac, M.Moronesi, M.Pacifico, G.Pasquale, M.Pigeon, J.Raffailhac (CEA Cadarache, Saint Paul les Durance, France).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.33-44 vol.3

The water-sodium reaction test has been carried out under geometrical conditions selected to permit extrapolation to Superphenix 1 steam generators. The authors discuss the comparison of calculated and experimental results concerning the pressure waves arising from injection of a high-volume water flow into a sodium mass, together with nondestructive examination and metallurgical analysis conducted on the bundle after the test. The eddy current method has a good detection limit for the type of defect being observed. (1 ref.)

60370 LMFBFR plant design features for sodium spill and fire protection. R.E.Palm (Burns & Roe Inc., Oradell, NJ, USA).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.45-53 vol.3

Design features have been developed for an LMFBFR plant to protect the concrete structures from potential liquid sodium spills and fires and prevent sodium-concrete reactions. The inclusion of these features in the plant design reduces the severity of design basis accident conditions imposed on containment and other critical plant structures. Steel liners are provided in cells containing radioactive sodium systems, and catch pans are located in non-radioactive sodium system cells. The design requirements and descriptions of each of these protective features are presented. The loading conditions, analytical approach and numerical results are also included. Design of concrete cell structures that are subject to high temperature effects from sodium spills is discussed. The structural design considers the influence of high temperature on design properties of concrete and carbon steel materials based on results of a comprehensive test program. The development of these design features and high temperature design considerations for the Clinch River Breeder Reactor Plant are presented. (no refs.)

60371 Experimental and analytical studies of sodium interactions with various concretes. A.Suo-Anttila, J.E.Smaardyk (Sandia Nat. Labs., Albuquerque, NM, USA).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.55-63 vol.3

Mechanistic models of sodium/concrete interactions are described. The SCAM model of interactions with basaltic concrete is being verified by experiments. Modelling of sodium interactions with limestone concrete is still at a preliminary stage but shows promise of being able to quantitatively predict the experimental results. Comparisons with experiment are presented. (3 refs.)

60372 Experiments and analyses of sodium spray combustion. R.Kawabe, A.Suzuoki (Energy Res. Lab., Hitachi Ltd., Hitachi-shi, Japan), N.Sagawa.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.65-70 vol.3

Combustion experiments for sodium spray were made in a closed vessel of 2 m^3 , containing nitrogen and 0-21 vol% oxygen. About 400 g sodium were injected into the vessel through a spray nozzle at the bottom. The results revealed that oxygen consumption observed in the experiment was not more than 80% of that expected for complete combustion of sodium and the temperature in the spray outer region was higher than that of inner region, analogous to a candle flame. A computer program SOFIA-II was developed to analyze the experiments. In the code, the combustion of single droplets is calculated from an analytical model based on heat and mass balance at the flame. Using the calculated single droplet combustion rate, SOFIA-II also calculates the pressure and temperature transients in the vessel. The calculated transient of pressure was generally in agreement with the observed value. (no refs.)

60373 Physical and chemical characterisation of sodium fire aerosols. W.Cherdron, S.Jordan (Lab. fur Aerosolphys. und Filtertech., KFK, Karlsruhe, Germany).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.71-9 vol.3

The characterisation of nuclear aerosols is of fundamental importance for the calculation of the radiological consequences of reactor accidents. In LMFBFR accidents one of the main sources of aerosols is burning sodium. To investigate the release and behavior of sodium fire aerosols large pool fire (up to 500 kg sodium) and spray fire (up to 40 kg/sec) experiments have been performed in the FAUNA-facility. In this experiment the physical properties of sodium fire particles as well as chemical reactions has been studied. (5 refs.)

60374 Accommodation of sodium spills with a cell drainage system in an LMFBFR. G.Garabedian, H.R.Michael, J.M.Oddo (Stone & Webster Engng. Corp., Boston, MA, USA).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.81-9 vol.3

As part of a series of feasibility studies a primary heat transport system cell's ability to accommodate potential large sodium spills was evaluated. In previous cell designs, the cell liner had to contain the spill indefinitely. In a new concept, sodium resulting from a large spill flows, by gravity, to a drain tank located below the cell floor. In this design, the cell liner no longer must be a high integrity sodium-leak tight liner. The authors describe this concept. They also discuss an analytical evaluation of the cell's ability to accommodate a large sodium spill; this evaluation was conducted using the CACECO and SPRAY computer codes. (no refs.)

60375 A chemical study of the sodium-concrete reaction. M.G.Barker, P.G.Gadd (Dept. of Chem., Univ. of Nottingham, Nottingham, England).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.91-107 vol.3

A differential thermal analysis apparatus has been used to determine the heats of reaction and reaction temperatures of commercial concretes and their individual components with liquid sodium at temperatures up to 600°C . For reproducible results to be obtained the sodium had to be stirred during the determinations. X-ray powder diffraction was used to identify reaction products. The heats of reaction of aggregate materials were found to vary widely with values ranging from 200 J g^{-1} to 2172 J g^{-1} whilst SiO_2 gave a value of 1607 J g^{-1} . Reasons for this wide range of values have been proposed. (3 refs.)

60376 Sodium concrete interaction. J.Dufresne, J.Fermandjian (Dept. de Surete Nucleaire, CEA, Fontenay Aux Roses, France), C.Casselmann, J.C.Malet, M.Bolvin, Herber.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.109-19 vol.3

Computer codes have been developed in order to study the response of the containment building of a liquid metal fast breeder reactor to a sodium pool fire with sodium-concrete interaction: the NABE 1 code for safety analysis and the SORBET code for project calculations. The authors describe the computer codes, in particular the physical phenomena considered and the input and output data. They also present examples of comparison cases between experimental and calculated results with NABE 1 code. (2 refs.)

60377 Sodium oxide aerosol behavior in a containment vessel. Experimental tests and computer models. J.Fermandjian, C.Hervouet, D.Boulard (CEA/IPSN, Fontenay-aux-Roses, France), A.L'Homme, G.Lhiaubet, S.Goldstein, J.P.Magnaud, A.Meiane, J.C.Malet, C.Casselmann, V.Prodi.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.121-32 vol.3

Describes experiments to validate computer models that predict aerosol behaviour during LMFBR accidents. The authors discuss the aerosol source term using containment vessel tests, compare instruments that measure aerosol size distribution, and describe both theory and experiment concerning natural convection and aerosol deposition. (no refs.)

60378 Large leak sodium-water reaction code SWACS and its validation. O.Miyake, Y.Shindo, H.Hiroi, H.Tanabe, M.Sato (Power Reactor & Nuclear Fuel Dev. Corp., Tokyo, Japan).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.133-42 vol.3

A computer code SWACS for analyzing the large leak accident of an LMFBR steam generator has been developed and validated. Five tests data obtained by SWAT-3 test facility were compared with code results. In each of SWAT-3 tests, a double-ended guillotine rupture of one tube was simulated in a helical coil steam generator model with 1/2.5 scaled test vessel to the prototype SG. The analytical results, including an initial pressure spike, a propagated pressure in a secondary system, and a quasisteady pressure, indicate that the overall large-leak event could be predicted in reasonably good agreement. (4 refs.)

60379 Sodium-concrete reaction model development. D.H.Nguyen, L.D.Muhlestein, A.K.Postma (Hanford Engng. Dev. Lab., Richland, WA, USA).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.143-52 vol.3

Major observations are formulated after reviewing test results for over 100 sodium-concrete reaction tests. The observations form the basis for developing a mechanistic model to predict the transient behavior of sodium-concrete reactions. The major observations are listed. Mechanisms associated with sodium and water transport to the reaction zone are identified, and represented by appropriate mathematical expressions. The model attempts to explain large-scale, long-term (100 hr) test results where sodium-concrete reactions terminated even in the presence of unreacted sodium and concrete. (1 ref.)

60380 Air cleaning devices for vented filtered LMFBR containment. L.D.Muhlestein, R.K.Hilliard (Hanford Engng. Dev. Lab., Richland, WA, USA).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.153-9 vol.3

An effort lasting several years is summarized. The effort evaluated, developed and tested air cleaning devices for potential use in breeder reactor containment venting applications. State-of-technology evaluations were completed for both a hypothetical head release accident and a primary vessel melt-through accident. Commercially available systems or components were tested which included HEPA filters, sand and gravel beds, and aqueous scrubbers. Large-scale demonstration tests were completed and results are presented for two- and three-stage conventional aqueous scrubber systems; and for a newly developed passive, submerged gravel scrubber. (3 refs.)

60381 New insights in sodium water reactions and their effects on steam generators. J.K.van Westenbrugge, P.H.L.Groenenboom, J.J.de Jong, J.Joziasse, B.V.Neratoom.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.161-70 vol.3

Discusses the effects of sodium water reactions on steam generator internals. Mention can be made of the resonance effects of pressure waves on helical bundles. Also computer codes for 3D-pressure waves are being developed. On the experimental side tests have been performed comparing the behaviour of different holes, in 12 Cr-steel and in stabilized 2 1/4 Cr 1 Mo-steel, during water injections in to sodium. (6 refs.)

60382 The Esmeralda project for studying extensive sodium fire. Y.Sophy, M.Loubriat, A.Bentz, A.Gerosa, H.Freslon, U.Piatti (Nuclear Safety Dept., CEN Cadarache, Saint Paul les Durance, France).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.171-81 vol.3

Describes the Esmeralda Project for studying extensive fires involving up to 70 metric tons of sodium. The decision to create this research facility was related to construction of the Super-Phenix breeder reactor and to the scale effect problems posed by the use of very large quantities of sodium. Information is given on the dimensions of the installation, the objectives of the project, the means to be employed, the timetable to be followed, and the organization which was created for this project within the context of Franco-Italian cooperation. (no refs.)

60383 Sodium fires in SUPER-PHENIX. F.Hedin, A.Bentz, A.Gadola (NERSA, Lyon, France), A.Herauld, J.C.Malet.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.183-200 vol.3

Presents the features adopted in SUPER-PHENIX to take into account the risk connected with sodium-air reaction. The discussion covers the main options of design, prevention, detection, lay-out, venting, means of fighting against a hypothetical sodium fire, accidental and functional analysis. (no refs.)

60384 Aerosol leakage through containment walls. J.F.van de Vate, W.F.van Leeuwen, H.C.D.Smit (Netherlands Energy Res. Found., Petten, Netherlands).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.223-32 vol.3

Experimental results are presented on aerosol penetration through artificial cracks, simulating leaks in concrete walls of safety containments, and through model leaks of glass bead columns. The results on aerosol removal from a leak flow through leak paths compare fairly well with model calculations assuming turbulent inertial deposition in a high flow rate regime and sedimentation in a low flow rate regime. Other aerosol removal mechanisms are dealt with too. Briefly, results are reported on aerodynamics of sodium oxide particles. For the application of the results of this study to a nuclear safety analysis knowledge on leaks through containment walls and on aerosol particle size under severe accident conditions is lacking. (16 refs.)

60385 Study of the effects of major water leakage in a sodium-heated steam generator. J.Biscarel (CEA/DRNR/STRS, Saint Paul les Durance, France), M.Hugla, P.Peturaud.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.233-41 vol.3

Presents the assumptions and computer codes used by the CEA and EDF to simulate the consequences of a major water leak in a sodium-heated steam generator. The following subjects are covered in turn: determining the leakage flow rate; developing a physicochemical model of the resulting sodium-water reaction; hydrodynamic calculations of the effects on the structural components. The results of an experiment are also presented together with a numerical interpretation. (7 refs.)

60386 Safety aspects in the development and construction of fast neutron reactors cooled by sodium. B.Saitcevsy (NERSA, Lyon, France).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.123-38 In French.

Safety criteria relating to fast neutron, sodium cooled reactors were published for Super-Phenix in 1973. The major accident conditions examined have been summarised as main energy release, earthquake behaviour, thermo-hydraulics, handling of liquid sodium and activity releases requiring in-service inspection. Detailed discussion relates to Creys-Malville (1200 MWe, Rhone Valley), for which an outline vertical cross-section diagram is included, showing primary and secondary containment systems, nitrogen and argon circuits and filtration units. Under the thermo-hydraulic heading, mention is made of double wall vessels for separation into two redans, conical and toroidal. Additional details are given for safety aspects of the steam generator, shut-down plant, sodium fire detection, the sodium-water reaction and the monitoring of personnel irradiation doses. (no refs.) G.C.

60387 Safety methods and their application at the PHENIX nuclear power station. F.Conte.

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.247-55 In French.

The operational performance of the Phenix research reactor (9 years critical, 8 years operational) is detailed by monthly power histograms since 1974. Some personnel irradiation dose values are quoted. Safety stops have numbered about 100, causes being listed, the most frequent being 28 stops due to the sodium pump controls. A number of operating experiences are discussed. On the whole, most plant items worked without trouble. In 1982, there was a sodium-water reactor which lead to a shut-down and the replacement of certain items. Many details are given of the man/machine interface liaison, and techniques for improvement, which include the binocular viewing of vernier scales, and 27 closed circuit television cameras, linked to 7 receivers. (no refs.) G.C.

60388 Regulations, options and safety criteria. M.Laverie (SCSIN, Paris, France).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Societe Francaise d'Energie Nucleaire 1982), p.345-61 In French.

The French nuclear safety service was initiated on 13th March, 1973, with two permanent groups of experts, one concerned with nuclear reactors and one with other nuclear plant. The functions of the organisation are to set up an authorisation procedure, to survey the installation and to interpret control regulations. The departmental organisation is described, showing the breakdown of responsibilities from the Minister for Research and Industry to 17 industrial departments and 3 special groups (pressure vessels, nuclear reactors, laboratories and factories). Also detailed are the reporting procedures to be followed for authorisation of construction and commissioning. A separate section is included relevant to Creys-Malville for which 29 inspections have been carried out during the last six months. (no refs.) G.C.

60389 Waterside corrosion of zircaloy fuel rods. F.Garzaroli, W.Jung, H.Schoenfeld, A.M.Garde, G.W.Parry, P.G.Smerd. Report EPRI-NP-2789, Electr. Power Res. Inst., Palo Alto, CA, USA (Dec. 1982), 192 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.

This two-part report presents the results of a comprehensive investigation of Zircaloy cladding corrosion in PWRs. Part 1 discusses the oxide thickness measurements and the effect of various design and reactor operating parameters on Zircaloy corrosion. Oxide film characterization data, thermal-hydraulic analyses, and statistical analyses of the data are also presented. Part 2, on microfiche, provides the oxide thickness data obtained from individual fuel rods.

28.52 FUSION REACTORS

(for confinement, see 52.55)

60390 Trapping and surface recombination of deuterium in fusion reactor metals. S.M.Myers (Ion Solid Interactions Div., Sandia Nat. Lab., Albuquerque, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1175-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Ion implantation and ion beam analysis were used to examine bulk trapping and surface recombination for deuterium in Fe, Ni, and austenitic stainless steel. Irradiation-defect traps were characterized in the three metals, and substantially stronger traps were shown to be associated with small He bubbles. The rate of deuterium release at stainless steel and Fe surfaces was measured as a function of temperature and solution concentration. Trapping and surface recombination parameters were extracted by applying established theory for solute diffusion within a field of traps. (12 refs.)

60391 MeV light atom beams for heating and/or diagnostics of Tokamak plasmas. L.R.Grisham, D.E.Post, D.R.Mikkelsen (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1179-82 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The authors have studied the possible usefulness and feasibility of multi-MeV beams of light atoms ($4 \leq A \leq 30$) for applications in magnetically confined plasmas heating or current drive, and as a diagnostic to probe the velocity distribution function of the confined energetic alpha particles which result from fusion reactions between deuterium and tritium. The combined current and energy requirements for these applications appear to preclude the use of electrostatic acceleration. However, electric-quadrupole-focused RF linear accelerators such as the radio frequency quadrupole (being developed at LASL) or the MEQUALAC (at BNL) appear to be promising technologies. (14 refs.)

60392 An application of SIMS to fusion energy research determination of ion impact desorption cross sections. R.Bastasz (Sandia Nat. Labs., Livermore, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1183-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Measurements of plasma effects on materials are required in the design and evaluation of fusion reactor components. One of the more prevalent effects is ion impact desorption (IID) of surface impurities, which may influence plasma temperatures and fuel recycling rates. This paper describes the application of secondary ion mass spectrometry (SIMS) to measure IID processes. (10 refs.)

60393 Multi-megawatt neutral beams for MFTF-B. R.G.Kerr (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1197-200 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The Mirror Fusion Test Facility (MFTF-B) at Lawrence Livermore National Laboratory is a reactor-scale tandem-mirror experiment that will provide physics and technology bases for a D-T burning, tandem-mirror facility in the 1990s. Neutral beams of deuterium are injected into the vessel at various places and for different purposes. Plasma streaming guns located on the vessel end domes will provide a 30-cm radius, $2 \times 10^{12} \text{ cm}^{-3}$ density to act as a target. Ten 20-kV, 100-A sources will fire into the anchor region for 10 ms and sixteen 80-kV, 80-A, 0.5-s sources will fire into various regions to raise the plasma density to 4.8×10^{13} in the solenoidal central-cell region. (7 refs.)

60394 A design study of a palladium diffuser for a D-T fusion reactor fuel clean-up system. S.Konishi, H.Yoshida, Y.Naruse (Tokai Res. Establ., JAERI, Ibaraki, Japan).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.457-64 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

In a recent study a palladium diffuser was shown to be feasible for a fusion fuel purification process which removes various impurities from plasma exhaust gases. In this study a mathematical model was developed to analyse the separation characteristics for a tubular palladium diffuser. Experiments with H₂-He mixtures were carried out to determine some parameters for an actual diffuser. The hydrogen recovery ratio is defined as a function of the tube dimensions and operating conditions for a diffuser with a high recovery ratio are estimated. A fuel clean-up system for a fusion reactor equipped with the diffuser was also designed. (7 refs.)

60395 Experimental studies on biconical, explosion-driven thermonuclear-fusion system. H.Derentowicz, L.Grygoruk, K.Jach, J.Wrobel, Z.Ziolkowski (S. Kaliski Inst. of Plasma Phys. & Laser Microfusion, Warsaw, Poland).

J. Tech. Phys. (Poland), vol.22, no.4, p.371-8 (1981).

In the authors' studies on biconical explosion-driven systems, the thermonuclear-fusion reaction was obtained as a result of compressing small-size cylindrical UD₃ and UD₃T targets. The fusion neutron-emission was registered at the level of $N \approx 10^4 \div 10^5$ neutrons per shot for UD₃ and 10^7 for UD₃T. The ad hoc developed measuring- and registering setup employed enables measurements to be performed of short nano-second neutron pulses from the level already of $N \approx 10^3$ neutrons per shot. The ad hoc developed biconical system, in view of its constructional features and of the small mass of explosive, constitutes a convenient device for basic studies of the physical phenomena in the field of thermonuclear microfusion. (9 refs.)

60396 Generation of pulses of intense magnetic field with up to 350 Tesla induction by the method of explosion-produced compression. A.Farynski, L.Karpinski, A.Nowak (Skaliski Inst. of Plasma Phys. & Laser Microfusion, Warsaw, Poland).

J. Tech. Phys. (Poland), vol.22, no.4, p.379-90 (1981).

A system has been developed that permits the induction $B_{\text{max}} \leq 350 \text{ T}$ to be obtained by the cumulation method, within a volume of $0.25\text{-}0.5 \text{ cm}^3$. For that purpose a bank of capacitors is needed of an energy of about 100 kJ, and the necessary amount of explosive is about 2 kg. The average frequency of experiments along with the production cycle was one shot per 1-2 weeks. In the last series in all the shots $B_{\text{max}} > 100 \text{ T}$ was measured. Discrepancy of results in the series in which identical systems were operated is to be accounted for chiefly by the stochastic nature of the development of Rayleigh-Taylor instabilities that destroy the measuring probes at various instants of the final stage of the field compression by the conducting liner. (11 refs.)

60397 A simple ablative implosion model—shell dynamics. F.J.Mayer, J.T.Larsen, J.W.Steele (KMS Fusion Inc., Ann Arbor, MI, USA).

Phys. Fluids (USA), vol.26, no.3, p.830-4 (March 1983).

A simple model, derived from Newton's Second Law, for the ablative implosion of a thin spherical shell is presented. The scaling dependence of the implosion time, shell velocity, and mass loss on shell dimensions and the critical physical parameter, the ablation pressure, is derived. Finally, the model is used to examine implosion energy efficiency and to describe an interesting application, wall-recoil heating of a contained fuel gas. (10 refs.)

60398 Implosion symmetry of laser irradiated fusion pellet. T.Mochizuki, S.Sakabe, H.Shiraga, K.Okada, T.Yabe, C.Yamanaka (Inst. of Laser Engng., Osaka Univ., Osaka, Japan).

Phys. Scr. (Sweden), vol.T2, no.2, p.479-85 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Implosion processes of 1.053 μm laser irradiated (1) thin solid density Be coated plastic microballoons and (2) thick low Z from coated glass microballoons have been diagnosed by an X-ray flash radiography method to investigate implosion symmetry of the pellet shell. Asymmetric implosion of Be coated pellet is due to a strong inhibition of lateral energy transport by a self-generated magnetic field. In the foam coated pellet significant improvement of the symmetry has been achieved. (14 refs.)

60399 Inertial confinement fusion. C.Yamanaka (Inst. of Laser Engng., Osaka Univ., Osaka, Japan).

Phys. Scr. (Sweden), vol.T2, no.2, p.486-9 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Implosion process has been investigated by using blue, green, red and far infrared lasers. Various types of target are compared to improve the implosion properties. A 'cannon ball' target is proposed and tested to show the high efficiency in implosion. (5 refs.)

60400 On the ignition conditions for turbulent plasmas. V.N.Tsytochik (Lebedev Inst. of Phys., Moscow, USSR).

Phys. Scr. (Sweden), vol.T2, no.2, p.588-9 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Possible change of ignition condition by plasma turbulence is discussed. (2 refs.)

60401 Physics of neutronless fusion reacting plasmas. B.Coppi (MIT, Cambridge, MA, USA).

Phys. Scr. (Sweden), vol.T2, no.2, p.590-5 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

On the basis of present day knowledge of plasma physics and available technologies it is shown that experiments to test the thermonuclear burn conditions of plasmas with fusion reactions that do not produce neutrons can be undertaken. (30 refs.)

60402 A historic achievement: controlled nuclear fusion. J.Buj.

Rev. Esp. Electron. (Spain), vol.30, no.339, p.10-13 (Feb. 1983). In Spanish. The background to the achievement of a controlled nuclear fusion is outlined. The simultaneous conditions necessary for a controlled nuclear fusion are described. Slow and rapid fusion are discussed and the stages leading up to the achievement are described. (no refs.) S.M.H.

60403 Nuclear fusion and the outlook for commercial fusion reactors. J.R.O'Mahony.

Trans. S. Afr. Inst. Electr. Eng. (S. Africa), vol.74, pt.1, p.3-6 (Jan. 1983). Nuclear fusion must rank as one of the most promising long term solutions to the energy problems facing the industrialised world. The fusion principle is described together with its possible advantages and disadvantages. (7 refs.)

60404 Nuclear fusion research at Pelindaba. F.J.Retief, J.R.O'Mahony (Dept. of Electrical Engng., Univ. of Pretoria, S. Africa).

Trans. S. Afr. Inst. Electr. Eng. (S. Africa), vol.74, pt.1, p.7-12 (Jan. 1983). Describes 'Tokoloshe', a medium-sized Tokamak type high temperature plasma physics experiment which was designed and built by the Atomic Energy Board. The electrical engineering aspects of the project are emphasized. (no refs.)

60405 A comparison of helium bubble behaviour in an austenitic and a ferritic steel. T.R.Armstrong, Z.H.Luklinska, S.K.Tyler, P.J.Goodhew (Dept. of Metall. & Materials Technol., Univ. of Surrey, Guildford, England).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.743-8 vol.2 Helium bubble populations have been created in a 316 stainless steel and an FI ferritic/martensitic steel by ion implantation and isothermal annealing. The bubble growth kinetics have been studied by electron microscopy: the bubbles grow by Brownian migration and coalescence and in the temperature range 600-700°C the dominant mechanism appears to be volume diffusion. However, in the ferritic material the shape of the faceted bubbles leads to the nucleation of steps on bubble faces becoming rate-limiting and this restricts the growth of the cuboidal bubbles. In comparison, for the many-sided bubbles in the austenitic material ledge nucleation does not become the rate-limiting step. (12 refs.)

60406 FATMAC. A machine for the fatigue testing of CT type samples in the HFR, Petten, Holland. P.Blanchard, P.May, H.Scheurer (Joint Res. Centre, Comm. of the European Communities, Petten, Netherlands).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.749-52 vol.2

FATMAC is a new type of in-pile crack testing facility, for conducting tests on CT type samples of any metal. FATMAC offers a continuous testing capability for a number of samples, even up to 20, with a comprehensive spectrum of specifications and instrumentation. In short, FATMAC is a flexible experimental approach to cater for an expanding need for an efficient, professional, in-pile material testing facility, such as is required in the growing field of fusion reactor materials research. (no refs.)

60407 The Technology Development Facility (TDF). J.N.Doggett (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.753-7 vol.2 The author has been studying small, driven, magnetic-mirror-based fusion reactors for the Technology Development Facility (TDF), that will test fusion reactor materials, components, and subsystems. Magnetic mirror systems are particularly interesting for this application because of their inherent steady-state operation, potentially high neutron wall loading, and relatively small size. The design is a tandem mirror device first described by Fowler and Logan (1981) based on the physics of the TMX experiments at Lawrence Livermore National Laboratory (LLNL). The device produces 20 MW of fusion power with a first-wall, uncollided 14-MeV neutron flux of 1.4 MW/m² on an area of approximately 8 m², while consuming approximately

250 MW of electrical power. The work was done by a combined industrial-laboratory-university group. (3 refs.)

60408 Spontaneous and continuous structure and surface transformations of refractory transition metals by hydrogen. H.Meusemann, L.V.Erichsen, H.Haverkamp, F.Luckner, A.Maas (Inst. fur Phys. Chem., Univ. Bonn, Bonn, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.759-65 vol.2

A survey is given on the behaviour of some refractory transition metals under pure molecular hydrogen. During many repeated cycles with alternating increase and decrease of temperature and gas pressure, the samples are observed in a Sieverts type device. In addition, a new SEM method has been developed allowing a continuous observation of the metal-hydrogen reaction in-situ. Thus the effects of surface morphological alterations can be photographically recorded. Results are presented for the metals vanadium, niobium, tantalum, yttrium and titanium. Beyond material failure due to phase transformations, unexpected interface phenomena like reduction of surface layers, erosion by chemical sputtering, especially at grain boundaries, whisker growth and high temperature hydrogen embrittlement have been found. (8 refs.)

60409 Structural and mechanical anisotropy of a nuclear grade AISI 316 stainless steel. M.M.Farag, R.Matera, T.Sasaki, E.Ruedl (Joint Res. Centre, Comm. of the European Communities, Ispra, Italy).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.767-72 vol.2

The effects of thermomechanical treatments on the grain size, precipitate phases and mechanical properties have been investigated on a nuclear grade type AISI 316 stainless steel. The aim of this study was to characterize small thickness samples prior to the light ion irradiation experiments foreseen for this steel. A noticeable effect of grain size inhomogeneity was observed on the precipitation kinetic and on the mechanical properties. (13 refs.)

60410 Helium bubbles at grain boundaries in an austenitic steel. P.L.Lane, P.J.Goodhew (Dept. of Metall. & Materials Technol., Univ. of Surrey, Guildford, England).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.773-8 vol.2 Helium bubbles are expected to contribute to both swelling and embrittlement in fusion reactor first wall materials. In particular, the nucleation and growth of helium bubbles at grain boundaries is likely to determine the extent of embrittlement. The authors report the results of a study of gas bubble nucleation at various interfaces in an austenitic alloy after helium implantation at 600°C. The results show that the total cavity volume is significantly enhanced at grain boundaries. Bubble nucleation has been related to the boundary structure; bubbles are aligned along dislocations only when the Burgers vector is large. (9 refs.)

60411 Irradiation creep in first wall model alloys. P.Jung (Inst. fur Festkörperforschung, KFA Julich GmbH, Julich, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.779-82 vol.2

Creep enhancement by 7 MeV proton irradiation has been investigated in 20% cold worked specimens of Ni, Ni-3.4 w/o W, FeCrNi, FeCrNiMo and type 316 stainless steel. Dependence of irradiation creep on stress, temperature and dose rate were studied, as well as transient effects arising from changing these parameters. (8 refs.)

60412 Tritium in vanadium. R.Lasser, H.Wenzl (Inst. fur Festkörperforschung, KFA Julich, Julich, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.783-8 vol.2 All-metal tritium facilities have been built for handling about 1000 Curie T₂, preparation of concentrated metal tritides MT_x, measurements of phase diagrams, etc. Properties of tritium in VT_x have been determined: out-gassing rates, lattice parameter changes, diffusion coefficient, structure and phase diagram. (9 refs.)

60413 Plastic flow and fracture of Ti-modified 316 austenitic stainless steel after high temperature aging in hydrogen. M.Mark-Markowitch, Y.Rosenthal, A.Stern (Nuclear Res. Centre, Beer Sheva, Israel).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.789-95 vol.2

300-400 at. ppm of hydrogen introduced by thermal aging at 780°C induces noticeable changes in mechanical properties and microstructure of 316-Ti ASS, in the annealed and 22% cold-worked condition, respectively. Hydrogen-softening and ductilizing effects were observed, also effects on fracture morphology. H trapping at interfaces of secondary phases is believed to be responsible for the various effects. (10 refs.)

60414 Thermal fatigue test facilities for simulating the first wall and limiter operating conditions. R.Matera (Joint Res. Centre, Comm. of the European Communities, Ispra, Italy), A.Perfumo.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.797-801 vol.2

A number of facilities are in operation or under study at the JRC Ispra in order to test the behaviour of FW and limiter structural component under thermal fatigue. They range from laboratory scale experiment to full scale facility suited to perform thermo-mechanical tests on a real size FW module. The characteristics of the experimental facilities and an outline of the relative test programme is given in this paper. (7 refs.)

60415 A programme for the study of fatigue of fusion reactor structural materials. F.Moons, M.Snykers, W.Vandermeulen (Nuclear Res. Centre, Mol, Belgium).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.803-7 vol.2 Fatigue of fusion reactor first wall structural materials is considered as an important life limiting factor. The first wall is subjected to an intense irradiation of neutrons which cause atomic displacements and a relatively high production of helium. This production of helium is higher as compared with fast fission reactors because of the strong increase of the cross section of (n, α) reactions for energies higher than 5 MeV. The aims of a collaborative programme between US, Japan and CEG are: study of the influence of different He to dpa ratios. For this purpose post-irradiation fatigue tests will be performed on specimens irradiated in the Belgian BR2 reactor and in HFIR; comparison of post and in-pile fatigue. Similar specimens will be tested in-pile and after irradiation. For this purpose a miniature fatigue testing module is being designed which will allow in-pile fatigue loading of a small hourglass specimen. Two to four of such modules will be placed in one irradiation rig.

Possible factors, which might contribute to a different in-pile and post irradiation behaviour, are discussed. (no refs.)

60416 Prospects for low activity aluminum structures. J.R.Powell, J.A.Fillo (Dept. of Nuclear Energy, Brookhaven Nat. Lab., Upton, NY, USA).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.809-14 vol.2

High-purity, low-activity powder metallurgy Al alloys can be developed for use in a fusion reactor at 300° to 400°C using He as a heat transfer medium. Hot water as a coolant may limit Al to 200°C. Based on the dual- or two-temperature design approach, commercial fusion reactor blanket designs are feasible. Aluminum appears well suited for experimental fusion reactors operating at wall temperatures below 200°C. (3 refs.)

60417 Helium ion damage in an amorphous Fe-Ni-Mo-B alloy. H.Van Swijgenhoven, L.M.Stals, G.Knuyt (Limburgs Univ. Centrum, Diepenbeek, Belgium).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.823-8 vol.2 Data are presented on helium gas bubble and helium blister formation for Metglas 2826MB during 5 keV He⁺-implantation in the temperature range 200K-600K and dose range 5.10²⁴-10²² He⁺/m². It is concluded that amorphous alloys are less radiation resistant as has been taught earlier. (37 refs.)

60418 The surface topography of Inconel, stainless steel and copper after argon ion bombardment. K.Vogelbruch, E.Vietzke (Inst. fur Chem., KFA Julich GmbH, Julich, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.829-33 vol.2

Energetic particle bombardment of metals is known to change the surface topography. To simulate the behaviour of the first wall of a fusion device under real plasma conditions, the authors have investigated the surface topography of rotating targets after 30 keV argon ion bombardment at 70° incident angle by electron scanning micrographs. Under these conditions Inconel 600, 601, 625, stainless steel, and copper showed no cones, pyramids or cliffs, but only etching figures and at higher ion doses relatively flat hills. Thus it can be concluded that the influence of energetic particles on the first wall of fusion reactor is smaller than expected from the results of such sputtering experiments, which have dealt with the formation of surface structures under ion bombardment at constant incident direction. (5 refs.)

60419 Evaluation of the energy required for constructing and operating a fusion power plant. R.Bunde (Max-Planck-Inst. fur Plasmaphys., Garching, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.837-44 vol.2

The energy required for constructing and operating a Tokamak fusion power plant is appraised with respect to the energy output during the lifetime of the plant. A harvesting factor is deduced as a relevant figure of energetic merit and is used for a comparison between fusion, fission and coal-fired power plants. Because fusion power plants involve considerable uncertainties the comparison is supplemented by a sensitivity analysis. In comparison with Light Water Reactor plants fusion power plants appear to be rather favourable in this respect. The energy required for providing the fuel is relatively low for fusion plants, thus overcompensating the considerably higher amount of energy necessary for constructing the fusion power plant. (5 refs.)

60420 The design of a 316 stainless steel first wall for a pulsed fusion reactor with wall loading greater than 10 MWm⁻². A.Caie (Associated Nuclear Services, Epsom, England), G.J.Butterworth.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.845-50 vol.2

A preliminary design study has been made of a 316 stainless steel first wall for a fusion reactor operating at a neutron wall loading of about 10 MWm⁻² and a burn cycle of about 1000 seconds. The study highlights the conflicting requirements of providing sacrificial material to withstand erosion whilst limiting the cyclic thermal stresses to give adequate fatigue life. The analysis is based on the ASME boiler and pressure vessel code Section III, particularly the high temperature case N47. The merits of helium and water cooling are compared and it is found that the high cyclic wall loading strongly favours water cooling. The maximum life of the first wall is governed by the erosion rate of the front surface and the fatigue characteristics of the material. The 20% cold-worked form of the material is found to be advantageous in resisting ratcheting under cyclic thermal stresses. The first wall geometry analysed consisted of parallel plain tubes arranged in an overlapping array. The relative disadvantages of other cross-sectional forms and of membrane wall layouts are discussed. It is suggested that the problems of accommodating irradiation-induced swelling strains will determine the layout and mode of support of the tubes but have only a minor influence on the choice of cross-sectional form. (6 refs.)

60421 Tokamak and reversed field pinch reactor cost scaling. P.I.H.Cooke (Culham Lab., UKAEA, Abingdon, England).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.851-6 vol.2 The interactions between the basic parameters of a Tokamak or reversed field pinch reactor have been modelled to show their relative influences on the reactor capital cost. The model shows that at a given power output, β -value and toroidal magnetic field at the coil, there is a maximum wall loading which can be attained for the Tokamak. If blanket costs scale approximately linearly with wall loading high wall loadings are not economically favoured, particularly for the reversed field pinch. (5 refs.)

60422 Lifetime considerations for the first wall of a DEMO reactor. W.Daenner (Max-Planck-Inst. fur Plasmaphys., Garching, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.857-62 vol.2

For a DEMO reactor operating at a neutron wall loading of 2 MW/m², a first wall lifetime of about 10 to 15 MW-yr/m² is desired. The consequences with respect to swelling and irradiation creep deformation as well as to the permissible erosion rates are discussed. It is concluded that the envisaged fluence goal can only be met if deformations in excess of 10% can be tolerated restricting at the same time erosion to about 0.1 to 0.2 cm/yr. Under more conservative assumptions a value of about 6 MW-yr/m² turns out to be a realistic goal. All investigations are based on a modular first-wall concept assuming helium as the coolant and 20% cold worked 316 SS as the first-wall material. For the lifetime estimates made by means of the FWLTB computer program the best current guesses about the irradiation behaviour of 316 SS in a fusion reactor environment were used. (6 refs.)

60423 Mechanical stress analysis for the twisted coils of the advanced stellarator WENDELSTEIN VII-AS. U.Brossmann, S.B.Mukherjee, J.Sapper (Max-Planck-Inst. fur Plasmaphys., Garching, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.991-6 vol.2 The standard confinement field of the advanced stellarator WENDELSTEIN VII-AS is exclusively generated by a modularly designed coil set. Forty-five twisted coils produced a toroidal field of 3 T during a pulse time of 5 sec. Water cooled copper wires carry a winding current of 40 kA at 3.3 kV. Force components in the radial, poloidal and toroidal directions are calculated for the individual coils using EFFI-code (Sackett, 1978). On the basis of an optimized support concept a stress analysis for the coils was carried out using SAP V (2). (7 refs.)

60424 Development of material for the JET mechanical structure. G.Celentano, M.Huguet, E.Salpietro (JET Joint Undertaking, Culham, England), K.Feuring, F.Reimann.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.997-1004 vol.2

The mechanical structure of JET device, shaped like a large spherical shell is made up of 64 castings with weights varying between 5 to 10 tonnes each. These castings have to withstand the very large forces arising from the toroidal and poloidal magnetic field of the JET machine. An extensive study was carried out to select a suitable material to produce such big castings and to set up a reliable industrial production method to suit the design requirements. The assessment led to the selection of an austenitic nodular cast iron. A review of the static and dynamic mechanical tests, fracture mechanic tests and functional tests carried out throughout all stages during the development and production is presented. (6 refs.)

60425 Mechanical analysis of TORE SUPRA superconducting toroidal field coils. J.J.Cordier, P.Libeyre, D.Lionnet, A.Torossian (Dept. de Recherches sur la Fusion Controlée, CEN, Fontenay-aux-Roses, France).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1005-10 vol.2

The detailed mechanical analysis of the TORE SUPRA toroidal magnet, has been achieved by using the finite element method, with the CASTEM system developed by CEA at Saclay. The strong anisotropy of the winding has been taken into account with orthotropic elements. Two steps characterise the study: a refined analysis of the most stressed area under toroidal field using bidimensional calculation led to an improvement of the design of the structure; a three dimensional analysis with rougher mesh but allowing, however, enough accuracy in the results was then undertaken to check average values. Only preliminary results for this last part are presented. (2 refs.)

60426 Poloidal field coils for the international Tokamak reactor study 'INTOR'. H.G.Dittrich, U.Jeske (Kernforschungszentrum Karlsruhe, Inst. fur Tech. Phys., Karlsruhe, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1011-13 vol.2

The poloidal field (PF) coil system consists of 21 solenoids. All these solenoids are superconducting and they are positioned outside the toroidal field coils. Thirteen of the PF coils are positioned inside the inner vault of the torus and have an outer diameter of 1.7 m. Seven of these 13 coils are provided for the ohmic heating of the plasma. The distribution of the rest of the PF coils is highly unsymmetric with big divertor coils at the bottom of the reactor in order to provide a single null poloidal divertor configuration. The outer diameter of the largest coil is 12.6 m. (no refs.)

60427 Mechanical tests on components used in the TORE SUPRA superconducting coils. D.Duthoo, J.Hamelin, P.Libeyre, A.Torossian (Dept. de Recherches sur la Fusion Controlée, CEN, Fontenay-aux-Roses, France).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1015-20 vol.2

Reports the test results on glass-epoxy composites and on stainless steel which are extensively used for the coil, and for the casing respectively. In the case of glass-epoxy, industrial products have provided satisfactory results under static and dynamic loads. Two welding processes of stainless steel have been tested and it is shown that the joints fit the high requested characteristics. Tests performed on small mockups of the winding have permitted the determination of its Young's and Coulomb's moduli. (3 refs.)

60428 Toroidal field coils for INTOR. H.-G.Dittrich, J.Erb, R.Flukiger (Kernforschungszentrum Karlsruhe, Inst. fur Tech. Phys., Karlsruhe, Germany), M.Hilal, U.Jeske, A.Nyilas, G.Ries.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1021-6 vol.2

The toroidal field (TF) coil for INTOR consists of two subcoils, a NbTi coil with a maximum induction of 7.6T and 10.9 kA conductor current and a Nb₃Sn coil with 11 T maximum induction and 20 kA conductor current. The overall coil dimensions are 8.56 m x 11.06 m. The TF coil is centered by a double vault. Each supports individually the centering forces of each subcoil. The vault dimensions are designed to maintain a mechanical stress below 400 MPa. All TF coils are embedded in an overturning force support structure. (2 refs.)

60429 Employment of the Large Coil Test Facility in toroidal field coil development. P.N.Haubenreich, R.E.Bohanan, J.N.Luton, J.R.May, H.E.Miller, T.L.Ryan (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1027-32 vol.2

The international large coil task (LCT), involving EURATOM, Japan, Switzerland, and the United States, is developing competing concepts of superconducting toroidal field coils. Six different coils will be tested together in the Large Coil Test Facility (LCTF). All participants are collaborating in planning and will share all test data. (6 refs.)

60430 Numerical calculations of an effective elasticity tensor and peak stresses for the large fusion magnets. T.Iwanicki (Brown, Boveri & Cie, Mannheim, Germany), W.Maurer, W.Heinz.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1033-8 vol.2

For the calculation of mechanical properties of large magnet systems in 3-dimensional space, a very fine subdivision of the magnet structure is necessary. In the finite element programs, this will lead to unacceptable long computing times and to the limits of computer-storage capacity. The problem can be solved by the numerical method, called 'numerical simulation', by which an effective elasticity tensor is obtained for a composite material. It is possible to calculate the average stress using the effective elasticity tensor and

the peak stresses in each point of the structure using the surface displacement interpolation. A good agreement is found between the experimental and theoretical moduli of elasticity. All the calculations are performed by the finite element computer code ASKA for one of the toroidal magnet coils from LCT. (5 refs.)

60431 The toroidal field magnet concept of ASDEX Upgrade. O.Jandl, H.Kolotzek, E.Springmann, B.Streibl (Max-Planck-Inst. fur Plasmaphys., Garching, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1039-44 vol.2

ASDEX Upgrade (UG), a divertor Tokamak with a minor plasma radius of $a=0.5$ m and a plasma current of 1.2 to 1.5 MA, is intended to succeed ASDEX. A major target of this experiment is to investigate a reactor-compatible plasma boundary. This requires a toroidal field (B_0) at the plasma centre normalized to the aspect ratio (A) of $B_0/A \approx 1.2$. The toroidal field (TF) magnet designed to meet these requirements is presented. Its turnover structure aspects, such as force transfer, coil housing and access to the plasma vessel are described. The coil concept developed in collaboration with industry is also presented. Results of the cooling and stress analysis are summarized. (1 ref.)

60432 On strength of welded joints in high strength, large scale copper coils for nuclear fusion equipment. H.Kimoto, H.Kojima, S.Hioki, T.Takizawa, T.Watanabe, K.Imai, T.Uehara (Mech. Engng. Res. Lab., Hitachi Ltd., Ibaraki-ken, Japan).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1045-50 vol.2

Experimental studies were done to improve and evaluate the strength for heavy copper welded joints of coils using special welding techniques. The cold press-working process is used for the improvement of softened and weakened parts of welded joints of copper. To evaluate the strength of copper welded joints, static and fatigue tests are carried out. The results of tests demonstrate that the strength of improved welded joints of copper satisfies the severe design specifications. The fatigue life of welded defects is estimated with a high degree of confidence with fracture mechanics. (6 refs.)

60433 Vacuum magnetic fields and modular coil system of the advanced stellarator Wendelstein VII-AS. J.Kisslinger, F.Rau, H.Wobig (Max-Planck-Inst. fur Plasmaphys., Garching, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1051-7 vol.2

The vacuum field and the modular coils of the advanced stellarator WENDELSTEIN VII-AS are described. Each of the five field periods contains 9 different twisted coils, one of them with increased dimensions and current to provide sufficient access for neutral beam injection. The standard configuration ($B=3$ T, rotational transform $t=0.39$, aspect ratio ≈ 10 , low shear, and magnetic well) can be varied by toroidal and vertical fields, or by changing independently the current in the special coils. From a study of magnetic field perturbations some estimates are given for the admissible coil tolerances. (17 refs.)

60434 Strength analysis of cooling pipe joints for poloidal field coil for nuclear fusion equipment. H.Kojima, H.Kimoto, S.Hioki, T.Takizawa, M.Furuyama (Mech. Engng. Res. Lab., Hitachi Ltd., Ibaraki-ken, Japan).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1059-66 vol.2

It is necessary to confirm the reliability of a poloidal field coil (PFC) under operating loads during the design process. One of the most important points in this confirmation is the evaluation of PFC fatigue strength, because coils are used under conditions where the applied stress may be close to the elastic proportional limit of copper. Since a PFC is welded or brazed structure in which each turn consists of several copper conductor segments, the cooling pipe laid in the conductor also has pipe joints. These pipe joints determine PFC strength. A stress analysis is carried out to determine a reasonable structure for cooling pipe joints, given the limited space available for the joints. Experimental studies are also performed to evaluate the fatigue strength of pipe joints. As a result of these strength analyses, a bellow structure was selected as the most appropriate PFC cooling pipe joint. It was confirmed that such joints are strong enough to be used in PFCs. (8 refs.)

60435 The technical concept of the ASDEX UG poloidal field coils. H.Kolotzek, M.Pillsticker, F.Werner (Max-Planck-Inst. fur Plasmaphys., Garching, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1067-71 vol.2

The ASDEX UG Tokamak poloidal field coil system will comprise three ohmic heating coils and three vertical field coils. The ohmic heating coils consist of a highly excited coil in the central bore of the toroidal field magnet and coils outside the toroidal magnet arranged in pairs symmetric to the torus midplane. This coil arrangement is expected to generate a magnetic flux swing of about 9.5 Vs for a total discharge time of the plasma of 10 s. The vertical field coils can be arranged (a) all outside the toroidal magnet system, and (b) partially between the toroidal magnet system and the vacuum vessel, likewise in pairs symmetric to the torus midplane. (2 refs.)

60436 Electromagnetic systems for high-field Tokamaks. Yu.Alekseev, V.Demichev, M.Safonova, V.Chuyanov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1073-9 vol.2

The concept and principal parameters of a toroidal magnetic system for a high-field Tokamak are discussed. The temperatures, suitable for the reactor, and the confinement parameter can be reached with high plasma density, high magnetic fields and with adiabatic compression of the plasma column as the main technique of heating (not due to large dimensions of the Tokamak). The use of high fields is aimed at decreasing the dimensions and cost of an installation. The optimization of the field strength with different restrictions to a material of the coil has been done. The rated field on the plasma column axis is ~ 130 kOe, that on the conductor surface is ~ 200 kOe, the field-flat-top-duration is 200 ms. The possibility of designing a toroidal magnetic system is discussed. Each section of this system is a massive turn bandaged with a high-strength steel. Thermal regimes of the magnet are calculated. (7 refs.)

60437 Manufacturing of the European LCT-coil for the large coil task. H.Krauth, A.Nyilas, A.Ulbricht (Inst. fur Tech. Phys., Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), C.Albrecht, H.Salzburger.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1095-100 vol.2

The major manufacturing steps of the European LCT-coil are described. About 7 km of forced flow cooled superconductor were fabricated in the required unit lengths of 500 m. Each two lengths are wound by hand into a double pancake. A total of 7 double pancakes are stacked in a segmented mould for vacuum-pressure impregnation with epoxy resin. The impregnated winding pack will be inserted and force locked in the prefabricated coil case made from a 316 LN type stainless steel. Extensive instrumentation is applied to the coil for diagnostic purposes during the testing period. (9 refs.)

60438 Numerical analysis of the metal forming process during the winding procedure of the European LCT coil. G.Messemer, H.Zehlein (Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1101-6 vol.2

Presents a numerical study of the mechanical behaviour of the superconductor cable for the European LCT coil during the winding procedure. A simplified discrete elastic model was applied to describe the sharply rising bending moment near the touching point on the bobbin under different tension forces. A bilinear elasto-plastic bending moment-curvature relationship as derived from bending experiments was used. The circumferential distributions of the relevant process variables over the D-shaped coil contour show a pronounced influence of the tension force and the local coil curvature. (11 refs.)

60439 A procedure for the computation of magnetic field, temperature and force distributions in the design of Tokamak toroidal coils. P.Molfino, G.Molinari (Inst. di Elettrotecnica, Univ. di Genova, Genova, Italy), F.Rosatelli, A.Viviani.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1107-13 vol.2

Presents a formulation of the problem of coupled electric, magnetic and thermal fields in Tokamak toroidal coil, oriented to give satisfactory results with reduced computer resources. This goal is achieved by the introduction of an equivalent two-dimensional coil, whose solution is related to the solution of the original three-dimensional problem. A package allowing the solution of the resulting set of partial differential equations is also presented, its features are described and some results are displayed are discussed. (3 refs.)

60440 The design bending stress criterion for JT-60 coil. M.Ohkubo (JAERI, Ibaraki-ken, Japan).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1115-20 vol.2

The design bending stress criterion of the JT-60 coil conductor are described. JT-60 coil conductors are made of 0.2% silver bearing oxygen free copper (0.2%Ag-OFC) hardened by cold-rolling. They are connected by welding or brazing to make full turn. The relationship between load and deformations for a conductor subjected to an axial and a lateral loads is taken into consideration in the stress analysis and the collapse load and true strain are calculated by the derived equations. It is clear from the analysis results that the materials with yield-tensile ratio more than 0.5 have a safety factor of 3 and those with yield-tensile ratio less than 0.5 have a higher safety factor more than 3 when the coils are designed in accordance with ASME section III. In the JT-60 coil, the design value has sufficient factor higher than 3, which may guarantee the reliability of the coil. The present analysis may be applicable not only to the copper conductors but also to the other materials such as steel. (3 refs.)

60441 Toroidal field magnet for FT-U device. A.Pizzuto (Centro Ricerche Energia Frascati, EURATOM-ENEA sulla Fusione, Rome, Italy).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1121-6 vol.2

The FT-upgrade Tokamak in order to accomplish its aims has to operate its magnet under very high stress for a large number of shots. In order to assess the feasibility to a magnet capable of this performance, an extensive three dimensional finite element stress analysis and an extensive material cryogenic test program has been developed. The main results obtained are illustrated. (4 refs.)

60442 Manufacture, assembly and testing of the inner poloidal coil stacks of JET and TFTR. J.C.Rauch, Th.Roman, F.Konig (BBC Brown Boveri & Co. Ltd., Zurich, Switzerland).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1127-32 vol.2

The insulation of both JET and TFTR inner poloidal coils is based on the Oriltherm resin system. JET and TFTR have a comparable test voltage level. Nevertheless, insulation thickness and build-up are different. Results of electrical sample testing of the two insulations are presented. Some special design features of JET and TFTR coils are shown in various manufacturing steps. The presentation of the coil stack assembly procedure of JET and TFTR reflects the two concepts of the toroidal coil load bracing. (3 refs.)

60443 Manufacture and test of the TEXTOR BT-coils. U.Schwarz (Inst. fur Plasmaphys., KFA, Julich GmbH, Germany), P.J.Ferry.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1133-8 vol.2

The TEXTOR TF-magnet consists of 16 circular coils. Each coil consists of two essential parts—the copper winding and the amagnetic steel frame. The paper describes the manufacturing of these different pieces and the tests applied on quality assurance. (4 refs.)

60444 Finite-element stress analysis and its impact on the design of the Swiss LCT coil. A.Segessenmann, Th.Hilpert, J.C.Rauch, R.K.Maix (BBC Brown Boveri & Co., Zurich, Switzerland).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1139-44 vol.2

The design of the Swiss LCT coil is based on a cabled and soldered forced-flow cooled conductor, out of which the coil is wound in 11 double pancakes and impregnated with epoxy resin. The coil is embedded in a stainless steel case, the subassemblies of which are bolted together. In order to prove this concept a three-dimensional finite-element analysis was carried out to obtain stress distributions in the coil and the case. Based on this, two-dimensional detailed calculations were made for highly stressed areas of the coil and the case. The impact of these investigations on the design is shown. (6 refs.)

60445 The toroidal field coil support structure for the Culham MKIIC Tokamak reactor. W.R. Spears (Culham Lab., UKAEA, Abingdon, England), S.F. Calvert, D.H. Prothero.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1145-50 vol.2

Describes the first stage of a study into the design of a support structure for the toroidal magnetic field coil system of the Culham MKIIC Tokamak Reactor. A structure is developed which will permit blanket removal and maintenance without breaking the toroidal field coil cryostat. The study includes consideration of fault conditions and the significance of cyclic stresses, and indicates problem areas which are now being considered in greater detail. (8 refs.)

60446 Electrical insulation system fit for cyclic high strain (development of insulation of JT-60 poloidal field coil). T. Watanabe, H. Kamiya, F. Aki (Hitachi Works, Hitachi Ltd., Ibaraki-ken, Japan), M. Nagai, K. Kadotani, M. Ohkubo, T. Ando, M. Masuda.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1151-6 vol.2

For cyclic high strain requirement of JT-60 poloidal field coil the authors have developed a new insulation system. They have manufactured some bar coil specimens whose cross section size is the same as the JT-60 PFC. They have loaded these specimens with 4 points bending moment, and confirmed that the new insulation system is fit for a cyclic strain of $0.27\% \sim 5 \times 10^4$ cycles. (4 refs.)

60447 Design-relevant local mechanical effects under fault conditions of the European LCT coil. H. Zehlein, G. Messemer (KFA Karlsruhe GmbH, Karlsruhe, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1157-62 vol.2

The paper presents simplified descriptions of two types of local mechanical effects: support load diffusion effects under asymmetric loading due to a faulty neighbouring coil and containment of quench pressure inside a faulty superconductor cable within the winding pack. The design-relevance in terms of model simplification as well as safety margins is discussed for the European LCT coil. (8 refs.)

60448 The TORE SUPRA poloidal field system. M.d'Alencón, B. Barety, H. Cortial, C. Leloup, G. Rey, E. Rijnoudt, G. Schenk, B. Taquet (Dept. de Recherches sur la Fusion Contrôlée, CEN, Fontenay-Aux-Roses, France).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1165-71 vol.2

The aims of the TORE SUPRA poloidal field system are to induce, provide equilibrium for and maintain during half a minute, a plasma current of 1.7 MA with poloidal β values up to 3.5. The main objects of the TORE SUPRA Poloidal field system are: a saturated iron core transformer—a single poloidal field coil system, all coils located outside the toroidal field coils, connected in parallel with differential voltage control—the use of a 1.1 GVA thyristor DC breaker—a direct supply from the 400 kV network. (4 refs.)

60449 Efficiency of passive circuits for vertical stability in INTOR reactor. S. Bobbio, E. Coccorese, G. Fabricatore, R. Martone, G. Rubinacci (Inst. di Elettr., Univ. di Napoli, Napoli, Italy).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1173-8 vol.2

Passive stabilization, usually performed by the vacuum vessel, is scarcely effective in INTOR because of its distance from the plasma. Therefore a stabilization system made of a set of split conductors vertically connected at the ends of each blanket module is studied. This work aims to develop calculation tools, able to optimize the design of the stabilizing passive conductors (SPC) and to carry out a sensitivity analysis with respect to their main parameters. A new circuit form of the energy principle is used for the position optimization (model NRD) and a modal-analysis technique for the evaluation of the growth rate (model PCRD). The possibility of putting conductors either on the first wall or between blanket and shield is studied: optimal position and information on the dimensions of the conductors are shown. (7 refs.)

60450 Measurement and dynamic control of plasma position in TEXTOR Tokamak. W.A. Broeke, G. Waidmann (Zentrallab. für Elektronik, KFA Jülich GmbH, Jülich, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1179-84 vol.2

A control system for TEXTOR Tokamak has been designed using a detailed model including important eddy currents in machine components. Plasma displacements and current are controlled by 4 different coil currents. Realistic power supply models were provided. Actual values of controlled variables were evaluated by analogue computation from the tangential and normal component of the poloidal magnetic field. Magnetic sensors for these field components were developed from heat resistant steel cable. The feedback loops were optimized to stabilize the system against recurrent step function disturbances. Classical system design and decoupling allow the loops to be operated one by one. (7 refs.)

60451 The FTU poloidal field system. M. Gasparotto, L. Lovisetto, G.B. Righetti (Centro Ricerche Energia Frascati, EURATOM-ENEA sulla Fusione, Rome, Italy).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1215-20 vol.2

The poloidal field system of the FTU machine is subdivided in three sets of windings, transformer (TR), vertical field (VF) and feedback (F) to reach the following objectives: (a) to preprogram the plasma current time dependence using the transformer; (b) to maintain circular plasma in an equilibrium position irrespective of the poloidal β variations, using the VF windings, without affecting the plasma current; (c) to keep the plasma displacements from the equilibrium position within reasonable limits using the feedback windings again without interfering with the plasma current. The decoupling of the different effects is obtained using a decoupling transformer external to the machine. Many of the techniques employed are based on the experience gained on the FT Tokamak. (5 refs.)

60452 Time evolution of the coil currents shaping and centering a D-shaped reactor plasma. A. Nicolai (KFA Jülich GmbH, Jülich, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1221-6 vol.2

The currents in the poloidal field coils surrounding a D-shaped reactor plasma can in a good approximation be computed from the current density in a dense

coil fence, if the coil number is sufficiently high. The current density in the fence is calculated from the equilibrium parameters which emanate from the plasma current, the plasma shape, the pressure and the q-profile. During the ignition phase the coil current at the inner side must be decreased by 30% and the outer side increased by 40% if the temperature during the burn phase is 15 keV. (9 refs.)

60453 A 100 kV, 80 A, 10 sec power supply for neutral beam injector. M. Matsuoaka, O. Higa, M. Kawai, Y. Oguchi, Y. Ohara, T. Ohga, H. Ohtsuki, S. Matsuda, T. Shibata, K. Yoshida (JAERI, Ibaraki, Japan).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1361-6 vol.2

Prototype injector unit for JT-60 has been operating since last November. The authors describe the design of power supplies for the ion sources and their operating performances. Most of the efforts have been devoted to the system reliability, in particular, the control system and grounding system. Transient voltage analysis in case of breakdown was made by numerical calculation and was confirmed by the use of pulse generator in an actual set up. (5 refs.)

60454 Compact launching structures for lower hybrid waves. T.K. Nguyen, D. Moreau (Dept. de Recherches sur la Fusion Contrôlée, CEA, Grenoble, France).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1381-6 vol.2

Compact Lower Hybrid launching structures are described using a waveguide array in tandem with an E plane junction, phase shifters or passive waveguides. It can be shown that coupling between the waveguide apertures and the E junction plane does not perturb the N_1 wavenumber spectrum (parallel to the toroidal magnetic field) required for the slow wave penetration into the plasma provided that the electric length between these discontinuities is sufficient for the evanescence of upper parasitic modes. Numerical results are given for the alternate active and passive waveguide array first proposed by Motley and Hooke and for a new compact heating and current drive LH antenna. (6 refs.)

60455 Improved performance of the ASDEX neutral beam injectors. O. Vollmer, D. Cooper, J.H. Feist, R.C. Kunze, H. Lohner, W. Melkus, E. Speth, A. Stabler (Max-Planck-Inst. für Plasmaphys., Garching, Germany), Z.Yu.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1387-91 vol.2

In January 1982 the second beamline of the ASDEX neutral beam injection system was commissioned. Within a few weeks of operation the design value of 2.5 MW total neutral beam power into the torus was obtained with sufficient reliability. Already during the experimental period lasting to the end of July, the injected power could be increased up to about 3.3 MW, mostly based on improvements of the power supplies. A further improvement could be achieved by additional gas feed to the neutralizers. To eliminate the effects of the ASDEX magnetic stray field on the ion sources, a compensation system has been tested. Finally first experiments with respect to an increased power or pulse length of the ion sources are reported. (3 refs.)

60456 Design of a 3 MW ICRH system for ASDEX and W VII. F. Braun, R. Fritsch, F. Hofmeister, E. van Mark, S. Puri, M. Soll, F. Wesner, H. Wedler (Max-Planck-Inst. für Plasmaphys., Garching, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1393-8 vol.2

Additional RF heating in the ion cyclotron range of frequencies is planned to be applied to the ASDEX Tokamak and to the W VII-A and AS stellarators. To meet the physics requirements of these experiments, an RF power of 3 MW for 10 s is necessary at frequencies between 30 and 115 MHz. This power will be produced by one common generator system and transported to the experiments by long coaxial transmission lines. The ICRH system is described including the antenna design for ASDEX and W VII-A, the RF generator, the transmission lines and the tuning systems. Based on antenna calculations and model measurements the layout of the antennas and of the tuning systems has been optimized in order to reduce the electrical stress at critical points and to provide a maximum of radiated power within given geometrical limitations. (4 refs.)

60457 An integrated system for data acquisition, archiving and analysis in ETA-BETA II. G. Flor, N. Guarino (CNR, Univ. di Padova, Padova, Italy).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1405-9 vol.2

Describes the conceptual design of a new system, built around the functional blocks of data acquisition and archiving. Various kinds of data are recognized, on which specific functions are to be performed: shot setting parameters, shot attributes, raw data, intermediate results and also software module names. In order to adequately describe an intrinsically dynamic experiment the concept of experiment model is introduced, with a hierarchical structure reflecting logical and physical relationships. The interactions between blocks and with the environment are standardized by the definition of interface data structures. An integrated archiving system for raw data, intermediate results and related computing procedures is described, whose main goal is to simplify and standardize data access and analysis. (13 refs.)

60458 Computer control and data acquisition for neutral beam injectors. A.S. Glad (General Atomic Co., San Diego, CA, USA).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1411-19 vol.2

Computer support of General Atomic's Doublet III neutral beam injectors provides: the capability of acquiring, processing and displaying all beam physics data. The real time periodic monitoring and control of all neutral beam subsystems. The sequencing of multiple ion sources asynchronously from the same computer system. The permanent archiving of all beam physics and diagnostic data. (5 refs.)

60459 Monitoring and control of the TEXTOR grounding system. P. Huttemann, F. Schöngen, U. Schwarz (Inst. für Plasmaphys., KFA, Jülich GmbH, Jülich, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1421-6 vol.2

The grounding system of the Tokamak experiment TEXTOR consists of 5 single parts. A main part is the load ground (BE). All major parts of the Tokamak itself are connected to BE via suitable ohmic resistances. Thus load potentials against ground are kept low and fault currents are limited. During commissioning of the Tokamak frequent, careful and complete checks of BE turned out to be important for a troublefree operation of the Tokamak. The

paper describes the additional equipment for monitoring the components of the load ground BE. (1 ref.)

60460 Computer control system development for large fusion experiments. M.J.Kear, D.Richardson, E.G.Murphy, T.Jackson, K.Colyer (Culham Lab., UKAEA, Abingdon, England). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1431-6 vol.2

The design of computer based control systems for large fusion experiments requires a structured approach. This involves identifying the requirements and documenting the functional specification before the detailed design can be started. The authors discuss the procedures that were adopted in the early design stages of such a computer based control system and the way in which the detailed design evolved. Areas requiring particular attention such as the operator interface and inter-computer communication are discussed in detail. The design approach adopted is based on experience gained from designing, building, commissioning and successfully operating a prototype, distributed intelligence computer-control system. During this phase a great deal of experience was gained for future software handling techniques applicable to large experiments. The system is currently operating reliably and is to be submitted for safety approval in the near future. (5 refs.)

60461 System design of ZENKEI, the central control system of JT-60. I.Kondo, T.Kimura, N.Hosogane, T.Kawasaki, T.Kobayashi, R.Yoshino, K.Kurihara, Y.Suzuki, T.Nakayama, K.Moriyama (JAERI, Tokai, Japan). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1437-42 vol.2

ZENKEI, the central control system of JT-60 is in the final design stage. The authors have been extending the system to make it possible to control the plasma parameters such as density and temperature. This paper gives a brief description of the most recent design, especially those of the modification of the discharge control system. An additional computer and dual port memory with D-port were adopted. For event-oriented control of plasma discharges, the timing system was improved. (1 ref.)

60462 The TEXTOR diagnostic data acquisition system development status and first experience. M.Korten (Inst. fuer Plasmaphys., KFA Julich GmbH, Julich, Germany). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1443-7 vol.2

A computerized data acquisition system for the Tokamak experiment TEXTOR is under implementation and has been tested in the first experimental phase. The computer system consists of a VAX 11/780 processor as interface to the experimentalists and a PDP 11/44 as front-end computer interfaced to the diagnostic subsystems for TEXTOR. Connection between the data acquisition system and the various diagnostic subsystems is done by CAMAC instrumentation. The software system has been developed from the DIOS/GALE systems adopted from the IPP Garching, modified to enable decentralized operation of the participants. (7 refs.)

60463 Structure of the main control system for the FTU device. L.Panaccone (Centro Ricerche Energia Frascati, Rome, Italy). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1449-54 vol.2

The computer based control system for FTU (Fascati Tokamak Upgrade) machine is a distributed intelligence control system consisting of various subsystems, called 'specific units'. A specific unit can work as a stand-alone small system or as a part of more complex systems, together with other units, in any possible combination. In the case of combined units working mode, a dedicated specific unit performs supervisory functions. Communication between specific units is done on a dedicated bus-like network, in the form of temporary master-slave relationship. There are three groups of specific units: Plant Control Units, Supervisory Control Unit and Synoptic Handling Unit. Performances and structures of these specific units are described. In addition, a very simple hard-wired safety system works in parallel with the computer based control system, in order to save personnel and apparatus. (no refs.)

60464 Control and data acquisition system for the RF heating plant of the FT Tokamak. M.Panella (Centro Ricerche Energia Frascati, Rome, Italy). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1455-9 vol.2

The control and data acquisition system of the additional RF heating plant has been implemented by means of two intelligent CAMAC crates. The crate controllers are based on the LSI11 Digital microcomputer in a stand-alone configuration. The system hardware consists both of standard CAMAC modules and 'ad hoc' constructed modules. Several operating phases are described and interesting parameters and characteristics of the system are briefly mentioned. (1 ref.)

60465 The data acquisition system for ASDEX. D.Zimmermann, N.Ruhs, H.Hohenocker (Max-Planck-Inst. fur Plasmaphys., Garching, Germany). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1461-6 vol.2

The ASDEX Data Acquisition System is built as a distributed system to collect a large number of data from many diagnostics. The data acquisition system software GALE is adaptable to different experiments, flexible with respect to hardware configuration changes and simple to use for the experimentalist. A distributed system and a flexible acquisition software is the adequate response to fast growing demands for computer power of fusion experiments. (5 refs.)

60466 Experience with software-driven control and acquisition system. A.Simik (Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1467-71 vol.2

The design of the TCA Tokamak control and data acquisition system was reported at the 11th SOFT Conference (1980). The major part of the apparatus was complete in 1980. During 1981 and 1982 the experiment has been continuously operated and the author has implemented some more units. The use of software-controlled devices instead of hard-wired units substantially simplified the construction and also considerably reduced the cost of the hardware. (10 refs.)

60467 The control and data acquisition system of SPICA II. C.A.J.van der Geer, W.Kooijman, A.A.M.Oomens, P.H.M.Smeets, F.T.M.Koenen, A.J.Putter, H.J.F.van Ramele (FOM-Inst. voor Plasmafysica, Nieuwegein, Netherlands). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1473-9 vol.2

Describes the control and data acquisition system of SPICA II. Some recently developed hardware components are presented in detail. (4 refs.)

60468 PCM recorder for raw diagnostic data storage (Data Processing System for the JT-60). R.Toyokawa (JAERI, Ibaraki, Japan), A.Ogata, M.Shiho, H.Maeda, T.Kambe, S.Tahira, T.Kumahara, K.Tamamura, A.Fujioka, M.Fujita, O.Maeda, O.Mochizuki, N.Tahara. Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1481-6 vol.2

Studies in physics, especially those concerning unstable phenomena, require very frequent simultaneous samplings from many data channels related to various diagnostic devices. Moreover, it is often necessary to compare current data with previous data. Neither CAMAC memory modules nor computer peripherals fulfil these requirements. To cope with this problem, the large Tokamak JT-60 is equipped with PCM recorders, which serve as a mass data recording subsystem in the data processing system. This subsystem consists of diagnostic data formatting and transfer sections, PCM recorders, and a data base system based on an intershot processor. (6 refs.)

60469 A high speed transient recorder for fusion research applications. D.L.Trotman, P.R.Rhodes (Culham Lab., UKAEA, Abingdon, England), N.L.Bragg. Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1487-92 vol.2

Use of digital computers for the analysis of data from diagnostics of fusion experiments has resulted in a wide range of digital data recording systems of varying accuracies and speeds. The system described is capable of use in a wide range of applications, being able to convert samples of analogue signals into 10 bit digital codes at a minimum interval between samples of 100 ns. The relative timing between samples may be defined in a versatile sequence generator to be between 100 ns and approximately 30 years. Storage has been provided for a minimum of 4K samples, this number being extendable to a maximum of 64K samples. The transient recorder is formed by a series of CAMAC modules, permitting the extensive computer control of the recorder. Details of the system performance are also included. (2 refs.)

60470 Designing and development of the real-time control system for JT-60 plasma discharge. R.Yoshino, T.Kimura, N.Hosogane, K.Kurihara, I.Yonekawa, I.Kondo, Y.Suzuki (Tokai Res. Establ., JAERI, Ibaraki, Japan). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1493-8 vol.2

Real-time plasma control is planned to be executed in JT-60 experiments. The object of which is to obtain the Q=1 plasma, protecting the JT-60 machine from the electromagnetic force, heat load, etc. The authors present the design of this control system. (1 ref.)

60471 D₂ pellet acceleration with a centrifuge. W.Amenda, R.S.Lang (Max-Planck-Inst. fur Plasmaphys., Garching, Germany). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1501-5 vol.2

A promising candidate for quasi-continuous pellet injection is pellet acceleration with a centrifuge. The development of this mechanical acceleration method was first begun at ORNL and later at IPP Garching. This acceleration technique uses a guiding structure like a tube or a groove on a rotating disc or arm. With the exit tangential to the rotation circle the velocity of the accelerated pellet (neglecting friction) should be twice the peripheral speed of the centrifugal rotor. At IPP two possible techniques for feeding solid deuterium pellets into the entrance of the rotating guiding structure are envisaged. One is to cut a pellet from a prefabricated deuterium filament and throw it with high precision in time and position into the region of acceptance of the accelerating channel. The other is to insert the prefabricated deuterium filament directly during a rotation with a length required for the pellet and then let the pellet be cut by the entrance of the acceleration tube. At a convenient frequency of the centrifuge of up to 500 Hz and a maximum pellet length of 4 mm this calls for an insertion velocity of up to 2 m s⁻¹. This is a specification of the solid deuterium supply which cannot easily be accomplished. (8 refs.)

60472 Launching of D₂-pellets through guide tubes. K.Buchl, W.Sandmann (Max-Planck-Inst. fur Plasmaphys., Garching, Germany). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1507-11 vol.2

Cylindrical D₂-pellets of different sizes (diameter and length respectively 0.6, 1.5 and 2.5 mm) were launched with velocities of 400 to 1000 m/s through straight and curved guide tubes at room temperature up to a length of 12 m. Velocity losses of 12%, mass losses of 10 to 30% and divergence angles of the pellet trajectory up to 2° were measured depending on tube diameter and length. No difference could be observed for straight and curved guide tubes of curvature radius larger than 1 m. (2 refs.)

60473 Pellet fuelling development at Oak Ridge National Laboratory. C.A.Foster, S.L.Milora, D.D.Schuresko, S.K.Combs, R.V.Lunsford (Oak Ridge, Nat. Lab., Oak Ridge, TN, USA). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1513-18 vol.2

A pellet injector development program has been under way at the Oak Ridge National Laboratory (ORNL) since 1976 with the goals of developing D₂, T₂ pellet fuel injectors capable of reliable repetitive fuelling of reactors and of continued experimentation on contemporary plasma devices. The development has focused primarily on two types of injectors that show promise. One of these injectors is the centrifuge-type injector, which accelerates pellets in a high speed rotating track. The other is the gas or pneumatic gun, which accelerates pellets in a gun barrel using compressed helium or H₂ gas. (13 refs.)

60474 On the injection of deuterium pellets. H.Sorensen, P.Andersen, S.A.Andersen, V.Andersen, P.B.Jensen, H.E.Skovgard Jensen, A.Nordkov Nielsen, B.Sass, K.-V.Weisberg (Riso Nat. Lab., Roskilde, Denmark). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1519-23 vol.2

Two pellet injector systems are described. One is used for injecting small D₂ pellets (5.10¹⁷ molecules and 150 m/s) into a small Tokamak, Dante, and one

is planned for injecting larger D_2 pellets (8.10^{18} molecules and 650 m/s) into the TFR Tokamak at CEN, Fontenay-aux-Roses, Paris. (5 refs.)

- 60475 A low energy X-ray fluorescence method for high dose measurements on double emulsion photographic films. J.Swahn, G.Roubaud, J.W.N.Tuyn (Health & Safety Dept., CERN, Geneva, Switzerland). *Radiat. Prot. Dosim. (GB)*, vol.3, no.4, p.219-21 (1982).
 The exposures of Kodak Personal Monitoring Type 2 films were evaluated using X-ray fluorescence of the low-energy silver $L\alpha$ X-rays excited by a ^{109}Cd source. This method allows the separate reading of both the fast and the slow emulsion without the need to strip the films. Exposures of up to 250 rad of γ -radiation can be evaluated. The method is useful in evaluating accidental exposures. (5 refs.)
 60476 A simple modification to improve the energy dependence of ion chamber survey meters. A.Kannan, V.W.Naik, P.N.M.R.Vijayam (Radiological Standards Lab., Bhabha Atomic Res. Centre, Bombay, India). *Radiat. Prot. Dosim. (GB)*, vol.3, no.4, p.223-5 (1982).
 The use of high Z materials like phosphor bronze to ensure good electrical contacts inside the ionisation chambers of some survey meters increases their energy dependence at photon energies below 600 keV. A simple modification to reduce such enhanced energy dependence is described. (3 refs.)
 60477 Influence of light transmission on the response of LiF thermoluminescence detectors to thermal neutrons. M.Buxerolle (Nuclear Res. Centre, Cadarache, Saint-Paul-lez-Durance, France), F.Spurny. *Radiat. Prot. Dosim. (GB)*, vol.3, no.4, p.233-5 (1982).
 The influence of light transmission on the response of opaque LiF thermoluminescence detectors to thermal neutrons has been studied. It was found that this can be significant. TL signals read from the surface of ^6LiF detectors irradiated in a directional beam of thermal neutrons differ by up to 80%. A quantitative parameter characterising this effect using one-side alpha particle irradiation has been established. The parameter allowed the influence of opacity on TL reading after thermal neutron irradiation to be calculated. Good agreement was found between calculated and experimental results. Some implications of the effect studied on thermal neutron detection with LiF are discussed. (4 refs.)

- 60478 A polystyrene-water calorimeter. S.R.Domen (Center for Radiation Res., NBS, Washington, DC, USA). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.3, p.643-4 (March 1983).
 A new type of calorimeter consisting of polystyrene discs in water is described for the measurement of absorbed dose in polystyrene, which is reported (for some irradiation conditions) to have a heat defect of $<1\%$. This calorimeter provides another investigative tool for comparison with absorbed dose measurements in water, which is the standard reference material. Measurements using ^{60}Co γ -radiation showed that converting the results to water agreed within 1% with similarly determined results when using a graphite calorimeter. These results are $\sim 3\%$ lower than those determined with a water calorimeter, suggesting a negative heat defect in water $\sim 3\%$ —when measuring an absorbed dose rate ~ 1 Gy/min that produced an accumulated dose up to 150 Gy. (9 refs.)
 60479 A high-purity inert atmosphere cell suite for research purposes—design and operating experience. J.T.Demant (AERE, Harwell, England). *Nucl. Energy (GB)*, vol.22, no.2, p.95-9 (April 1983).
 A small specialized hot-cell suite has been developed for the handling, examination and storage of irradiated nuclear fuel samples containing alkali metal and other oxygen- and moisture-sensitive materials. High atmospheric integrity is the prime consideration and the facility achieves a nitrogen atmosphere with oxygen and moisture levels each below 50 vpm. Provided certain precautions are taken, metallographic mounting, preparation, microscope examination and sample transfer to remote analytical instruments can be carried out under adequate α -containment and $\beta\gamma$ -shielding without significant decomposition of the materials of interest. (no refs.)
 60480 Measurement of iodine-129 at the femtogram level by negative surface ionization mass spectrometry. J.J.Stoffels (Pacific Northwest Lab., Richland, WA, USA). *Radiochem. & Radioanal. Lett. (Switzerland)*, vol.55, no.2, p.99-105 (23 Dec. 1982).
 A mass spectrometer method is developed for measurement of environmental iodine-129. Negative surface ionization of iodine on a lanthanum hexaboride-coated rhenium filament is used to produce I^- ions with higher efficiency. A three-stage mass spectrometer provides high abundance sensitivity for measurement of the large $^{127}\text{I}/^{129}\text{I}$ isotope ratios encountered in environmental samples. The ability to measure 10^7 atoms (2×10^{-13} g) of iodine-129 in a pure sample of sodium iodide which has a $^{127}\text{I}/^{129}\text{I}$ isotope ratio of 0.5×10^8 has been demonstrated.  A six-stage pulse generator for triggering an oil trigatron in an electron acceleration was developed. The generator features the following parameters: capacitance at moment of discharge, 1 nF; voltage amplitude, 180 kV; voltage rise time 6 nsec. The dischargers of the second and third stages are triggered by a pulse formed by the discharge of an additional capacitor across the first discharger. This permits shortening the response time of the generator to 30 ± 2 nsec. (5 refs.)
 60483 Observations of ion acceleration by a relativistic electron beam. G.S.Kerslick, A.K.L.Dymoke-Bradshaw, A.E.Dangor (Blackett Lab., Imperial Coll. of Sci. & Technol., London, England). *J. Phys. D (GB)*, vol.16, no.4, p.613-19 (14 April 1983).
 Experimental evidence is presented for the collective acceleration of ions by a 350 keV, 50 kA, 100 ns electron beam. Accelerated ions are observed for

vacuum injection, and at hydrogen fill-pressures below 50 m Torr. Measurements with different anode foils indicate that thicker foils reduce the number of ions accelerated. An applied magnetic field is found to increase the energy spread of the ions while leaving the total number accelerated unchanged. The total number of ions accelerated is $\sim 10^{12}$, with peak currents of 7 A. (17 refs.)

60484 Experimental investigation of the process of ion accumulation in electron rings. V.P.Sarantsev, V.D.Inkin, A.A.Mozelev. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1107-9 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1806-9 (Sept. 1982). [received: April 1983]

The process of ion accumulation in electron rings has been investigated experimentally. Relations have been found for the dependence of the ion storage on the pressure in the buncher chamber and on the intensity of the electron component of the rings. The experimental relations are in agreement with the calculated relations. (12 refs.)

60485 Theory of the transverse instability of an electron beam. N.I.Aizatskii (Physicotech. Inst., Acad. of Sci., Khar'kov, Ukrainian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1113-15 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1815-19 (Sept. 1982). [received: April 1983]

The author describes the results of theoretical studies of the development of a transverse instability in a single accelerating section, taking account of the dynamics of the interaction of beam particles with a finite number of eigenmodes of the resonator. The dependence of the critical current on the parameters of the section is calculated. It is shown that the calculated characteristics are in good agreement with experimental data. (10 refs.)

60486 Transverse electron motion and emittance development in the injector of an electron linear accelerator. I.N.Mondrus (Physicotech. Inst., Acad. of Sci., Khar'kov, Ukrainian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1116-18 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1820 (Sept. 1982). [received: April 1983]

Approximate asymptotic solutions of the equations of transverse motion in the injector of an electron linear accelerator are obtained for the case of a large, longitudinal, magnetic focusing field. These solutions are used to study the development of the transverse phase volume in injection systems where the cathode is shielded from the magnetic field and where the cathode is located in the magnetic field. (for plasma accelerators, see 52.75)

60487 Linear optics design of the superconducting low- β insertion in the intersecting storage rings at CERN. A.Verdier (CERN, Geneva, Switzerland). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.301-7 (1 April 1983).

A superconducting insertion has been installed in the ISR at CERN and has made it possible to obtain a luminosity in excess of $10^{32} \text{ cm}^{-2} \text{ s}^{-1}$. The different steps of the optics design of this insertion are described. The method used for the final design is based on the exact calculation of the width of the gradient stopband associated with any focusing perturbation in a circular machine. Some consequences of operating a storage ring with a large gradient stopband are analysed. (15 refs.)

60488 Transverse mode coupling in a bunched beam. K.Satoh, Y.Chin (Nat. Lab. for High Energy Phys., Ibaraki, Japan). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.309-20 (1 April 1983).

A fast transverse single bunch instability has been observed and has restricted the stored currents in several storage rings, e.g. PEP and PETRA. The paper describes a method, which is the generalization of Sacherer's theory without mode couplings, to analyse the fast transverse instability in a Gaussian bunch. This method includes the radial modes and requires negative azimuthal modes. It makes clear that the fast instability in PEP and PETRA is caused by the mode coupling between the azimuthal modes $m=0$ and $m=-1$, and that its growth rate rises very rapidly above the threshold. The method also predicts that the threshold current could not be improved by a large factor even if the bunch length is increased to several centimeters. The TRISTAN threshold current estimated by scaling from the PEP experimental data is about 3.5 mA per bunch for the worst case. (21 refs.)

60489 The mechanism of integer resonance crossing and the prospects for higher energies in cyclotrons. L.A.Sarkisyan (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.325-9 (1 April 1983).

The problems arising in studying the mechanism of dynamic integer resonance crossing of free radial oscillations Q_r in an isochronous cyclotron are discussed. Numerical simulation of the motion on the basis of complete equations is used to find and study the slow crossing of the most hazardous integer resonance $Q_r=2$ (energy $\sim E_0$) with subsequent acceleration to $\sim 1200 \text{ MeV}$ where $Q_r \approx 2.3$. The results of the calculations for resonance crossing in linear and nonlinear systems are compared; the role of linear and nonlinear effects is demonstrated. The mechanism of integer resonance crossing in the cyclotron is accounted for in the case of slow energy gain per turn. Successful integer resonance crossing permits cyclotron acceleration of protons and ions in the 1-10 GeV/nucleon range. The projects of such cyclotrons have been published in several countries. The prospects for and trends in cyclotron acceleration of particles up to high energies are discussed. (12 refs.)

60490 Bunched beam instability associated with cavity impedance.

H.Nishimura (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.518-21 (March 1983).

Investigation is made on the longitudinal single bunch instability of the electron beam in a high energy storage ring. It is shown that the Robinson instability of a parasitic mode is caused by the interaction between a high order synchrotron oscillation and a higher order resonant mode of an RF cavity. Two damping mechanisms, the Landau damping and the radiation damping, are investigated and the stability criteria are obtained. (11 refs.)

60491 The University of Illinois nuclear physics laboratory, 1982. P.Axel, L.S.Cardman, R.A.Daniel, A.O.Hanson, R.A.Hoffswell, R.M.Laszewski, W.C.Selvey, N.Towne, A.M.Vetter (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1112-14 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A six-traversal microtron using a superconducting linac, MUSL-2, provides 100% duty factor electron beams with energies between 2 and 80 MeV. Five major experimental facilities have been developed to exploit the high duty cycle, including both low and high energy bremsstrahlung facilities, two photon tagging systems, and an electron scattering coincidence facility. The properties of the accelerator and the work in progress to improve its performance are outlined. The capabilities of each experimental area are discussed with examples from recent research projects. Finally, the authors' plans to construct a 750 MeV, 100 μA cascade microtron using room-temperature linacs are presented. (27 refs.)

60492 Stabilization of longitudinal instabilities in heavy-ion storage rings.

P.R.Zenkevich, D.G.Koshkarev.

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.817-21 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.36-9 (July-Aug. 1982). [received: April 1983]

Considers the instability of longitudinal coherent oscillations in heavy-ion storage rings. It is shown that dissipative coherent instabilities in such rings can be stabilized by selecting a special momentum distribution function of the particles. (5 refs.)

60493 A high-power current pulse generator. V.I.Amelichkin, B.G.Kudasov, Yu.P.Kuropatkin.

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.884-6 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.97-8 (July-Aug. 1982). [received: April 1983]

The circuits and operating principles are described, and the fundamental characteristics of the generator for supplying a low-inductance ($\sim 100 \mu\text{H}$) accelerator electro-magnet with sinusoidal current pulses 20 kA in amplitude, $\sim 650 \mu\text{s}$ in length, and with a repetition frequency of 3 Hz are presented. The basic features of the generator are the fact that it employs a solid-state switch and the energy-storage effects. (3 refs.)

60494 Orbital stability of the high-current betatron. G.Barak, N.Rostoker

(Dept. of Phys., Univ. of California, Irvine, CA, USA).

Phys. Fluids (USA), vol.26, no.3, p.856-66 (March 1983).

Orbital stability of the high-current betatron is analyzed. In this modified betatron a toroidal magnetic field is added to the conventional betatron magnetic field. This increases substantially the space charge limit during injection. It gives rise, however, to new problems during acceleration, such as ring stability, Fermi drift, and orbital resonances. A detailed analysis is presented showing that two serious problems may arise: (i) The beam becomes highly unstable when the net focusing force on it becomes zero. The dominant instability in this region is the Fermi drift. This may, however, be utilized in extracting the beam. (ii) Errors in the vertical (betatron) magnetic field result in driven resonances that must be crossed during acceleration. The amplitude growth of the transverse betatron oscillations due to these resonances is negligible up to very high γ (low n resonances). In practice, it may become very difficult to cross the $n=1$ resonance. Thus, extracting the beam again making use of the Fermi drift while $n>1$ is preferable. (16 refs.)

60495 Limiting electron beam current for cyclic induction acceleration in a constant guide field. V.N.Kannikov.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1118-22 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1825-31 (Sept. 1982). [received: April 1983]

Theoretical relations are derived for the limiting beam current in a cyclic induction accelerator (CIA) with a constant guide field. The calculations are in agreement with the available experimental data. It is shown that the limiting average beam current in a CIA is of the order of 100 microamperes, i.e. the level attained in microtrons and linear accelerators. The CIA may find industrial applications. (11 refs.)

60496 Experimental study of stochastic cooling in the NAP-M proton

accelerator. E.N.Dement'ev, N.I.Zinevich, A.S.Medvedko, V.V.Parkhomchuk,

D.V.Pestrikov (Inst. of Nuclear Phys., Acad. of Sci., Novosibirsk, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1225-30 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1993-2001 (Oct. 1982). [received: April 1983]

Experimental results are reported for stochastic cooling of the energy spread in a proton beam. The behavior of the damping rates is studied as a function of the beam phase density, number of working harmonics, and feedback circuit gain. The steady-state energy spread in the beam was determined by the noise in the electronic equipment. Coherent beam instability was found to be associated with movement of the beam in the pickup electrode. The limitations of the experimental method due to noise from the electronic equipment and collective effects in intense beams are discussed. (8 refs.)

60497 Status of the superconducting cyclotron project in Milan.

E.Acerbi, F.Aghion, F.Alessandria, G.Baccagioni, G.Bellomo, C.Birattari,

J.Camon, C.De Martinis, E.Fabrics, C.Pagani, F.Resmini, L.Rossi, A.Salome,

L.Serafini, G.Varisco, V.Venturini.

Report INFN/TC-82/12, Ist. Naz. Fis. Nucl., Milan, Italy (18 Aug. 1982), 25 pp.

The authors give a comprehensive status report on the Superconducting Cyclotron now under construction at the University of Milan. Since the project was extensively reviewed at the time of the International Conference on Cyclotrons held in Caen in September 1981, the emphasis will be on the progress made since then and on the few design changes which have taken place meanwhile. (11 refs.)

60498 The cyclotron facility for radiation damage experiments at the

JRC-ISPR. G.Riccobono, M.Castiglioni, A.E.Merlini (Joint Res. Centre,

Comm. of the European Communities, Ispra, Italy).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.815-21

vol.2

The light particles variable energy cyclotron installed at the Physics Division of the JRC, Ispra, accelerates protons and α -particle in the energy range from

9 MeV to 38 MeV, and deuterons from 5 MeV to 18 MeV. The maximum current for protons and deuterons is 65 μ A in the entire energy range and 30 μ A for α -particles. A switching magnet equipped with seven exit ports steers the beam to three radiation cells. The cyclotron was installed to simulate the radiation damage of 14 MeV neutrons in structural materials of interest to fusion reactors. A brief description of the experimental facilities in preparation is given. (5 refs.)

60499 The state and prospects in the development of the medical proton tract on the synchrocyclotron in Gatchina. D.L.Karlin, B.A.Konov, V.B.Nizkovols, N.K.Abrsimov, A.A.Vorob'ev, A.V.Kulikov, G.A.Ryabov. *Med. Radiol. (USSR)*, vol.28, no.3, p.28-32 (March 1983). In Russian.

The medical proton beam on the synchrocyclotron in Gatchina, modernized in 1980, is characterized by a simplicity of the beam adjustment that amounts to standard operations, the time of adjustment being reduced considerably. The optical scheme ensures a good reproducibility of all the beam parameters from session to session. A large zone of convergence makes it possible to select a necessary irradiation field size with the diameter from 3 to 10 mm. A new medical complex with a 2-room premises for irradiation is envisaged on the basis of a second beam to expand the medical program. The piercing technique of moving field irradiation with proton at an energy of 1 Gy and the utilization of the convergent beam ensure the ratio of the focal dose to the surface dose 200:1. (6 refs.)

60500 Bunch length measurements in CESR using an X-ray sensitive photoconducting detector. E.B.Blum, R.H.Siemann (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA), D.H.Auston, R.R.Freeman, P.Smith, D.M.Mills. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.321-4 (1 April 1983).

A novel photoconducting detector has been used for bunch length measurements in CESR. The detector and measurements are described in detail. At 5.17 GeV beam energy no bunch lengthening was observed for beam currents up to 26.0 mA (4.2×10^{11} electrons) in a single bunch. These results agree well with bunch lengthening calculations. (6 refs.)

60501 An energy calibration of the TUNL dual-90° magnet analyzing system. J.F.Wilkerson, T.B.Clegg, E.J.Ludwig (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.331-8 (1 April 1983).

An energy calibration of the dual-90° magnet momentum analyzing system has been completed for proton beams spanning the energy range of 1.9 to 14.2 MeV. The absolute calibration points used resulted from measurements of both (p,n) thresholds and narrow (p,p) resonances. The calibration measurements were made during several separate experimental runs over a time period of approximately $11/2$ y. Through careful monitoring of the system parameters and by using consistent magnet recycling procedures, the calibration allows accurate measurements of beam energies to within ± 2 keV. The dual-90° magnet system was determined to have a non-constant energy-to-frequency relationship for low magnetic fields. (14 refs.)

60502 Characteristics of α -transitions in an atomic-beam polarized deuteron source. H.Hasuyama, Y.Kanda (Dept. of Energy Conversion Engng., Kyushu Univ., Kasuga, Japan), A.Katase, Y.Wakuta.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.475-85 (1 April 1983).

Quantum mechanical calculations of the degree of polarization after inducing α -transitions in an atomic-beam polarized deuteron source have been done. Four parameters are found to be important for characterizing the performance of RF transitions. These are the strength of the RF oscillating magnetic field, the field gradient of the static magnetic field, the separation efficiency of atomic states and the temperature of atomic gas. It is shown that the degree of polarization can conveniently be evaluated by an 'adiabatic field factor' which is defined by the first two of these four parameters irrespective of the kind of α -transition. Some applications of the present results are also discussed. (17 refs.)

60503 High efficiency ionization of low-density elements in beam-plasma type ion sources. J.Ishikawa, A.Motamed Ekessabi, T.Takagi (Dept. of Electronics, Kyoto Univ., Kyoto, Japan).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.487-92 (1 April 1983).

An experimental approach is made to the problems of the gas efficiency of a beam-plasma type ion source under simple and well defined conditions. Two distinct modes of ion source operation, i.e. the 'monoenergetic electron impact ionization' and the 'beam-plasma discharge' are compared with respect to the gas efficiency. The gas efficiency for argon is about 25% under the beam-plasma discharge conditions. The authors also propose a method for high efficiency ionization of low-density elements which can not satisfy the threshold gas pressure conditions for commencement of the discharge, by making use of a ballast gas. Utilization of the ballast gas increases the gas efficiency of the low density elements by about 40 times. Finally, experimental results are given on high efficiency multiply charged ion beam ($Ar^{2+}/Ar^{1+} > 2$) extraction from the ion source when the beam-plasma discharge is initiated in helium. (21 refs.)

60504 Reduction of the neutron-induced background using a pulse-type beam chopper in an ISOL experiment. E.Tanaka (Dept. of Phys., Tohoku Univ., Sendai, Japan), T.Shinozuka, M.Fujioka, Y.Arai, H.Miyatake, M.Yoshii, H.Hama, T.Ishimatsu.

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.547 (March 1983).

When the nuclear decay of short-lived isotopes is studied with an ISOL (isotope separator on-line), the reduction of backgrounds for β - and γ -ray measurements becomes especially important because of the low yield of activities collected by the isotope separator. Recently, the authors have succeeded in reducing the neutron-induced background with the use of a 'pulse type' beam chopper (hereafter denoted as P-chopper). As an example they measured the decay of ^{59}Zn ($T_{1/2}=182$ ms) produced by the $^{58}Ni(^{4}He,2n)^{59}Zn$ reaction and mass-separated by the Tohoku ISOL facility. In accordance with the timing of the P-chopper, a microcomputer controlled the electrostatic deflection of the mass-separated beam, the motion of collection tape and the data-taking. (3 refs.)

60505 Effects of nonresonance harmonics on slow extraction from synchrotrons. Chen Limin, Fang Shouxian, Huang Nan (Inst. of High Energy Phys., Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.2, no.1, p.899-906 (1983).

The average effect of nonresonance harmonics on slow extraction from synchrotrons does not vanish in a long period, and in some cases becomes so important that it cannot be neglected. A method based on the theory of averages is employed to study the problem. The asymmetric shape of the separatrices in the phase-plane of the third-order resonance extraction is explained, and the effect of sextupole fields on the half-integer resonance extraction is analyzed in detail. It is shown that the extraction efficiency would be improved if some sextupoles are introduced properly into the half-integer resonance extraction system. (4 refs.)

60506 An experimental apparatus for low energy high charge heavy ions to study collisions on atomic hydrogen. C.Can, T.J.Gray, J.M.Hall, L.N.Tunnell (Phys. Dept., Kansas State Univ., Manhattan, KS, USA), S.L.Varghese.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.943-5 (April 1983).

(1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The design and performance of a recoil ion source system which includes a recoil ion source, atomic hydrogen thermal oven target and an electrostatic analysis system are discussed. The recoil ion source produces low velocity highly charged ions via collisions between heavy fast pump beams from the EN tandem accelerator and target gases. Time-of-flight techniques provide initial recoil charge state separation. Collisions of the recoils with atomic hydrogen are being studied. The atomic hydrogen is provided by a thermal oven which features long life time operation and low input power requirements. Dissociation fractions of 80% are achieved for 300 watts of input power. A hemispherical electrostatic analyzer allows the final charge states of the recoil ions to be determined thereby allowing the measurement of charge exchange processes for an energy range of 100 eV/q to 5000 eV/q for the incident recoil ions. (13 refs.)

60507 Atomic collision experiments utilizing low-velocity, highly-charged ion beams. B.M.Johnson, K.W.Jones, M.Meron (Brookhaven Nat. Lab., Upton, NY, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.946-9 (April 1983).

(1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Intense beams of highly-stripped ions are now routinely produced at low velocities using the Brookhaven dual MP-tandem in a unique four-stage accel/decel model. This mode of operation combines three stages of acceleration, stripping at high energy, and one stage of deceleration to near-zero velocity. To date, experiments have used 10-100 nA beams of bare and few-electron heavy ions at energies as low as 0.2 MeV/amu, and upgrades of the facility should push the lower limit below 0.1 MeV/amu. Recent experiments, such as measurements of charge transfer and X-ray production for S^{16+} on He and Ar at 6-20 MeV and P(b) measurements for MO X-rays produced in $Cl^{16+} + Ar$ collisions at 20, 10 and 5 MeV have demonstrated the usefulness of highly-stripped, a low-velocity projectiles. These experiments and a few possibilities for future experiments are discussed. (27 refs.)

60508 Studies of fast beam produced recoil ions in a Penning trap. W.S.Burns, D.A.Church, R.A.Kenefick (Texas A&M Univ., College Station, TX, USA), S.B.Elston, R.Holmes, D.Taylor, J.-P.Rozet, S.Berry, I.A.Sellin.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.977-80 (April 1983).

(1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Low energy recoil ions (He^{+4} , $1 \leq q \leq 8$) have been produced and contained in a Penning-type ion trap by means of a stripped 35 MeV Cl^{+3} beam from the Oak Ridge National Laboratory EN Tandem Van de Graaff. Initial investigation of the axial energy distribution of the stored recoil ions indicates that mean energies are less than 2q eV. The rate constants for several electron transfer processes were determined by the direct measurement of stored ion population decay as a function of pressure. (16 refs.)

60509 An overview of research at NBS using synchrotron radiation at SURF-II. D.L.Ederer, R.P.Madden, A.C.Parr, G.Rakowsky, E.B.Saloman (Center for Radiation Res., NBS, Washington, DC, USA), J.Cooper, R.Stockbauer, T.E.Madey, J.L.Dehmer.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1020-5 (April 1983).

(1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The National Bureau of Standards (NBS) Synchrotron Ultraviolet Radiation Facility (SURF-II) is used in conjunction with several high throughput monochromators to study the interaction of vacuum ultraviolet photons with solids and gases. Recent work has been concerned with the photon stimulated desorption of atomic and molecular ions from surfaces, with the effect of electric fields on molecular photoabsorption and with the study of molecular photoionization by angle resolved photoelectron spectroscopy. These research programs yield new information about molecular bonding at surfaces, molecular dynamics near ionization thresholds, and the coupling of the electronic and nuclear motion near resonances in molecules. In addition to these programs in basic research SURF-II is used for the calibration of transfer standard detectors over a photon energy range 20-250 eV. Calibration of monochromator systems is achieved over the photon energy range 5.250 eV by using the now calculable spectral intensity radiated by the electrons, which are confined in a nearly circular orbit. (22 refs.)

60510 Radioactive ion beams for studying astrophysical nuclear reactions. R.C.Haight, G.J.Mathews, R.M.White, L.A.Aviles, S.E.Woodard (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1160-3 (April 1983).

(1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Beams of radioactive ions can be produced as secondary beams following the interaction of conventional accelerator beams with suitable targets. For exam-

ple the authors have used beams of ^7Li and ^{12}C from an EN Tandem Van de Graaff accelerator to produce beams of ^7Be and ^{13}N via the (p,n) and (d,n) reactions respectively. These beams are focused by a system of magnetic quadrupole lenses to a secondary target. Reactions of such nuclides, especially proton capture and (p, α) reactions, are of interest in solar physics and in the CNO multi-cycle in massive stars. Progress toward the measurement of these reactions is discussed. (8 refs.)

60511 Tritium target performance at RTNS-II. D.W.Heikinen, C.M.Logan (Lawrence Livermore Nat. Lab., Livermore, CA, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.30, no.2, p.1193-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The Rotating Target Neutron Source (RTNS-II) uses a 360-keV deuteron beam and the $^2\text{H}(d,n)^3\text{He}$ reaction to generate 14-MeV neutrons. The neutrons are used for fusion materials damage studies. The tritium target consists of a band of titanium tritide on copper alloy substrates of 23- or 50-cm diameter. During operation, the substrates are internally cooled and rotated at ~ 4000 rpm to withstand beam intensities in excess of 100 mA. Neutron production data have been accumulated for fifty-eight 23-cm and five 50-cm targets. From these data, using a nonlinear least-squares fitting procedure, target performance parameters have been obtained which permit a quantitative comparison of individual targets. Average parameters are obtained for the 23- and 50-cm targets. (8 refs.)

60512 Porous tungsten relativistic electron beam cathodes compared with carbon cathodes. H.Matsuzawa, H.Kanai (Faculty of Engng., Yamanashi Univ., Kofu, Japan).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.508-9 (April 1983). Porous tungsten cathodes have electron emission characteristics similar to those of plain carbon cathodes, and carbon cathodes with many grooves on the front surface and with silicon resin coating on the lateral surface are superior in emission current to plain carbon cathodes by a factor of 50%. (2 refs.)

60513 Joule-Thomson effect in a Pierce electron gun. V.A.Batalin. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1110-12 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1810-14 (Sept. 1982). [received: April 1983]

A thermodynamic approach to the problem of propagation of an electron beam enables the emittance of the beam to be determined. It is shown that the growth of the emittance of an electron beam in a Pierce gun is similar to the Joule-Thomson effect for gases. The effect grows as the initial temperature of the beam is lowered. When the transverse temperature of the beam is of the order of 0.1 eV or lower the increase in the emittance may become significant even in perfect (aberration-free) Pierce optics. (11 refs.)

60514 Fiber-optic data transmission lines in charged-particle accelerator automatic control systems. P.G.Vanichkin, V.M.Batutin, A.I.Vagin, M.D.Kontorov, Yu.I.Monin, A.A.Nikolayev. *Telecommun. & Radio Eng. Part 2 (USA)*, vol.37, no.4, p.64-9 (April 1982). Translation of: *Radioelektronika, Moskva (USSR)*, vol.37, no.4, p.30-4 (April 1982). [received: April 1983]

The use of optical information transmission lines in the automatic control systems [ACS] of accelerator facilities is examined. Specific developments are described and their characteristics are given. Fiber-optic communication lines can be used at all levels of the ACS of modern accelerator facilities. Ambient effects on the line characteristics are reduced significantly. The results of studies of the characteristics of fiber and combined optical communication lines, as well as their practical realization, show that the use of such lines in the ACS of accelerator facilities is highly effective. (10 refs.)

60515 Radioisotope neutron sources. G.F.Knoll (Univ. of Michigan, Ann Arbor, MI, USA).

In book: *Neutron sources. For basic physics and applications*, p.7-18. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

Neutron sources that are based on the use of radioactive materials have been widely utilized in radiation laboratories for many years. These sources share a number of relative advantages compared with other sources of neutrons. They are of small size and therefore quite portable, relatively low in cost, and are characterized by a very reliable neutron yield of predictable intensity. Their 100% duty cycle and complete freedom from maintenance considerations are in marked contrast with accelerator-based neutron sources. These sources also have a number of significant limitations. In order to produce useful yields, relatively large activities of the various isotopes are required, necessitating careful fabrication techniques and attention to radiological safety precautions in their use. Even with relatively active sources, however, the neutron yield is often limited to several orders of magnitude below that obtainable with competing techniques. The neutrons that are produced have a fixed energy spectrum that is often quite broad. While many of the radioisotopes used have half-lives that are very long, some short-lived isotopes require frequent replenishment or reactivation. Also, some of these neutron sources may also produce gamma rays that can interfere with some applications and, in extreme cases, may require special handling techniques.

60516 Sources of monoenergetic neutrons. C.A.Uttley (AERE, Harwell, England).

In book: *Neutron sources. For basic physics and applications*, p.19-55. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

Monoenergetic neutron beams within the range from a few keV to 20 MeV are produced by electrostatic generators or cyclotrons and are in routine use in many laboratories. This energy range covers many of the neutron nuclear data requirements for both fission reactor (<10 MeV) and fusion (<15 MeV) applications, some of which can most precisely be satisfied using continuous or pulsed monoenergetic neutron beams. Nuclear data measured at fixed neutron energies in the MeV region can also usefully supplement data more commonly produced with pulsed white spectrum neutron sources from electron linear accelerators or cyclotrons, since problems with background neutrons are often less severe. The production of monoenergetic neutron beams is discussed followed by a description of the main properties and limitations of the more important source reactions. Electronic collimation of neutrons is considered in some detail because it provides accurately calibrated beams with a small energy spread which are used both for the measurement of absolute neutron cross sections and neutron detector efficiencies.

60517 14 MeV D-T sources. H.H.Barschall (Univ. of Wisconsin, Madison, WI, USA).

In book: *Neutron sources. For basic physics and applications*, p.57-80. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

Among the neutron producing reactions the reaction of ^2H with ^3H , the D-T reaction, has by far the largest cross section. It reaches 5 b at a deuteron bombarding energy of 105 keV. This large cross section at a low bombarding energy has made the D-T reaction the most widely used reaction for applications in which a compact intense neutron source is needed. Usually deuterons of energy between 100 and 400 keV are stopped in a metallic target in which tritium has been absorbed. Much effort has gone into the design of targets

that will provide a strong neutron source over a long time. Target performance is also strongly influenced by the energy, composition, and spatial current distribution of the bombarding deuteron beam.

60518 Accelerator-based pulsed white neutron sources. S.Cierjacks (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).

In book: *Neutron sources. For basic physics and applications*, p.81-132. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

Accelerator-based pulsed white (PW) neutron sources are presently the most efficient neutron sources for high-resolution measurements of microscopic neutron cross sections. Moreover, these sources are the only ones which can continuously cover the whole range from thermal energies (~ 25 meV) up to several tens of MeV. Their common characteristic is that short bursts of neutrons with a broad continuous energy spectrum are produced by nuclear reactions of energetic photons or charged particles. From the optical analogy such sources are described as 'white' or more precisely 'white spectrum' neutron sources.

60519 Intense deuteron and proton induced (CW)-neutron sources. M.A.Lone, C.B.Bigham (AECL, Chalk River, Ontario, Canada).

In book: *Neutron sources. For basic physics and applications*, p.133-55. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

High energy neutron sources based on high current continuous wave (CW) deuteron or proton accelerators and thick targets of light nuclei provide intensities that at present cannot be generated by other methods. This makes these sources attractive for neutron radiotherapy and for the materials irradiation facilities required in fusion-power technology. Because of the broad energy distribution and lack of suitable pulsing, CW sources are generally not adaptable to high-resolution nuclear data measurements. However, the higher intensities are useful for integral measurements of low cross sections and of isotope yields and for simulation of the neutronics in future fusion-power reactor blankets. The authors describe the characteristics of broad-spectrum, high intensity CW sources of neutrons with average energy above 10 MeV. These sources are based on deuteron or proton reactions at projectile energies below about 50 MeV. Some technical features of thick targets and of high current CW accelerators used in neutron sources of this type are also discussed.

60520 Pulsed reactor sources. W.L.Whittemore, G.B.West (General Atomic Co., San Diego, CA, USA).

In book: *Neutron sources. For basic physics and applications*, p.157-75. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

With the development of pulsed reactors, both fast and thermal, has come a wide variety of applications. While the primary interest is on neutron sources for neutron and nuclear research, the authors briefly cover a much broader range of applications. The singly pulsed reactors have provided also neutron sources for studying transient radiation effects in electronic circuits and components. They have been used extensively for evaluating the safety aspects of transient operation. A fast burst reactor with neutron moderator has been used to perform measurements of fission product nuclide yields. Thermal pulsed reactors in particular have been used for a variety of radiochemistry research efforts, and for neutron radiography. Both thermal and fast pulsed reactors have been used for nuclear pumped laser investigations. The underground single pulsed assemblies (nuclear explosion devices) have been used with long flight paths to measure neutron cross sections where advantage is taken of excellent signal-to-background conditions over a wide range of neutron energies.

60521 Filtered neutron beams. R.C.Block (Rensselaer Polytech. Inst., Troy, NY, USA), R.M.Brugger.

In book: *Neutron sources. For basic physics and applications*, p.177-96. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

In the past 15 years a need has developed for strong quasi-monochromatic neutron sources for applications to neutron physics, health physics, radiobiology, and dosimetry. Although only modest neutron resolution is required for these applications, it is important that these sources have a low background contamination from other energy neutrons and gamma rays. Simpson and Miller (1968) achieved these criteria at the Materials Testing Reactor (MTR) in Idaho by transmitting a beam of radiation from a reactor through a thick sample of Sc metal. The resulting neutron beam (800 eV wide at full-width-half-maximum (FWHM)) was centred about the 2-keV minimum in the Sc neutron total cross section. This technique was further developed at the MTR by Simpson and co-workers to produce an improved 2-keV filtered beam with Sc. In addition, beams centred at 24 keV with Fe and at 144 keV with Si filters were also produced. Filtered-beam facilities have since been set up at several reactors in the United States, Canada, Germany, Russia and India, and bands of neutrons near 186 eV, 2 keV, 24 keV, 55 keV, 144 keV and 2.35 MeV are now obtained with ^{238}U , Sc, Fe, Si, and O_2 filters respectively. Research has been reported in the areas of neutron cross section measurements, capture gamma-ray studies, and dosimetry studies.

60522 Pulsed neutron beams from steady state reactors. R.E.Chrien (Brookhaven Nat. Lab., Upton, NY, USA).

In book: *Neutron sources. For basic physics and applications*, p.197-216. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

The techniques of neutron energy measurements by time-of-flight were originally developed for pulsed cyclotron neutron sources in the late 1930s and early 1940s. In the postwar period, the high flux research reactors came into operation, and these techniques were adapted to reactor sources. In this discussion, a distinction is to be made between mechanical velocity 'selectors' and 'choppers'. The former instrument can be traced back to Dunning (1935), who used a pair of rotating wheels to demonstrate the Maxwellian nature of the energy distribution of neutrons in equilibrium with a system of moderator atoms at some temperature. The essence of the selector is its ability to transmit a narrow range of neutron energies by virtue of their motion through a suitably shaped slit, or set of displaced slits. A chopper, on the other hand, is capable of passing a broad range of energies, i.e. a 'white spectrum', through a rotating slit to form bursts of neutrons in space and time. These bursts are subsequently allowed to travel a flight path and their time of arrival is recorded by a detector, relative to a fiducial time signal derived from the chopper.

60523 Spallation neutron sources. J.S.Fraser, G.A.Bartholomew (AECL, Chalk River, Ontario, Canada).

In book: *Neutron sources. For basic physics and applications*, p.217-35. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]

Spallation neutron sources consist basically of an accelerator providing a beam of high-energy (≥ 1 GeV) protons or possibly heavier ions and a suitable target of heavy-element material. The physics and computational modelling of the primary target and descriptions of the essential components of representative types of target assembly for basic research and for energy applications are given. The types of accelerators used, and the performance and layout of the end-use components, i.e. moderators and beam tubes for research devices and blanket systems for energy applications, are discussed peripherally.

60524 Plasma neutron sources. H.Conrads (KFA Julich, Julich, Germany).

In book: *Neutron sources. For basic physics and applications*, p.237-58. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]. One of the main tasks in plasma physics and thermonuclear fusion research for developing a new energy source is the production of large quantities of neutrons, whose accumulated energies far exceed the energy needed for their production. If this goal can be achieved, plasmas will be one of the most intense neutron sources.

60525 Sources of polarized neutrons. L.Walter (Duke Univ., Durham, NC, USA).

In book: *Neutron sources. For basic physics and applications*, p.259-83. Oxford, England: Pergamon (1983), xx+349 pp. [0 08 029351 4]. The authors surveys only one small aspect of the published reports on neutron polarization studies, and that is the modes of generating beams of polarized fast neutrons to be used successfully in scattering or reaction experiments.

60526 Pulsed ion source of B-diode type with cryogenic anode. K.Kasuya, K.Horioka, T.Takahashi, A.Urai, H.Yoneda (Dept. of Energy Sci., Tokyo Inst. of Technol., Yokohama, Japan). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1081-6 vol.2

An applied-B, magnetically insulated diode (MID) with cryogenically refrigerated anode is proposed as a new type of ion source. With this ion source, proton beams of about 22 A/cm² and deuteron beams of about 15 A/cm², with their energy of 150 keV have been produced from the refrigerated anode with good reproducibility. These values are twice the Child-Langmuir prediction and not at all inferior to those extracted from conventional anodes. (5 refs.)

60527 The Julich ion source design and related thermo-mechanical pre-testing. P.Kupschus, J.Hemmerich, E.Deksnis, H.Fraenkle, C.Meixner, H.Reimer (KFA Julich, Julich, Germany). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1367-73 vol.2

Neutral injection for TEXTOR and other present and future fusion devices require pulse time capabilities in the multi-second range for their beam generators. The design principles and features of a multi-aperture ion source basically capable of an ion current of 100 A from a total area of about 20X50 cm² for a pulse length unlimited by the thermal loading of ion source components by plasma or beam are described. To confirm, in particular, construction principles and critical parameters of the design—which is presently under construction—certain models have been built and been subjected to thermo-mechanical testing; two of the more important ones are dealt with in more detail and results are given. (5 refs.)

60528 Development of an ion source for long-pulse (30-s) neutral beam injection. M.M.Menon, G.C.Barber, W.K.Blue, W.K.Dagenhart, W.L.Gardner, H.H.Haselton, J.A.Moeller, N.S.Ponte, P.M.Ryan, D.E.Schechter, W.L.Stirling, C.C.Tsai, J.H.Wheaton, R.E.Wright (Oak Ridge Nat. Lab., Oak Ridge, TN, USA). Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1375-9 vol.2

Describes the development of a long-pulse positive ion source that has been designed to provide high brightness deuterium beams (divergence $\approx 0.25^\circ$ r.m.s., current density ≈ 0.15 A/cm²) of 40-5 A, at a beam energy of 80 keV, for pulse lengths up to 30 s. The design and construction of the ion source components are described with particular emphasis placed on the long-pulse cathode assembly and ion accelerator. (9 refs.)

60529 An electronic energy measuring system for pulsed neutral beam calorimeters. D.Cooper, A.Stabler, O.Vollmer (Max-Planck-Inst. fur Plasma-phys., Garching, Germany), Z.Yu. Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1401-4 vol.2

Describes an electronic system for measuring and displaying signals from a 'neutral beamline' calorimeter. The system is modular and has been designed with simplicity and ease of use as the primary goal while maintaining reasonable accuracy. This system uses an LSI 11 microcomputer to measure temperature distributions over the calorimeter, and hardware logic for control and some processing. The hardware is integrated into the beamline control system and provides interlock information to the control system. The system provides time averaged as well as short term measurements of water flow rate and temperature, also total energy removed from the calorimeter in a predetermined time. Some modules can function independently therefore enhancing overall system reliability. Also particular attention was given to noise immunity in view of the Tokamak's hostile electrical environment. 29.30 RADIATION SPECTROMETERS AND SPECTROSCOPIC TECHNIQUES

60530 A semiconductor beta ray spectrometer. V.R.Bom (Phys. Dept., Delft Univ. of Technol., Delft, Netherlands).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.395-402 (1 April 1983).

The design and construction of a beta spectrometer which uses a hyper-pure germanium crystal for energy determination is described. Due to the good energy resolution, end points of continuous beta spectra can be measured accurately, even if the nuclides have short half-lives. The spectrometer is therefore especially suited for atomic mass determination in on-line mass separator experiments. A simple wire chamber is used to discriminate beta particles from gamma radiation. Disadvantages arise from the large amounts of scattered beta particles, deforming the continua; a method is described to minimize this scattering. (14 refs.)

60531 System of moving the source in a nuclear gamma resonance spectrometer. A.V.Golubev, V.M.Erkin, G.I.Kileinikov, V.D.Chervenko (Ogarev State Univ., Saransk, USSR).

Ind. Lab. (USSR), vol.48, no.6, p.574-7 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.39-41 (June 1982). [received: March 1983]

The present work presents a description of a simple, highly stable system of controlling the motion of the stem of an electromechanical vibrator based on an operational amplifier with low input current. It consists of two functionally complete and self-contained units: the unit of the driving sawtooth voltage based on amplifiers, and a unit consisting of the error-signal amplifier based on another amplifier, and the power amplifier based on transistors. (5 refs.)

60532 Progress report on heavy ion identification by Bragg Curve Spectroscopy at the Legnaro XTU Tandem Laboratory. G.D'Erasmio, D.Fabris, F.Gramegna, I.Iori, A.Moroni, G.Nebbia, A.Pantaleo, G.Prete, R.A.Ricci, G.Viesti, Li Zu Yu.

Report INFN/BE-82/4, Ist. Naz. Fis. Nucl., Legnaro, Italy (1 Dec. 1982), 13 pp.

The experimental work on heavy ion identification by Bragg Curve Spectroscopy at the XTU Tandem Laboratory is summarized. The problems in using BCS detectors and the lines of future work are discussed. (11 refs.)

29.40 RADIATION DETECTORS

(for mass spectrometers, see 07.75)

60533 Use of a large multicell ionization detector—the external particle identifier—in experiments with the BEBC hydrogen bubble chamber. V.Baruzzi (CERN, Geneva, Switzerland), R.Carosio, F.Crijns, L.Gerdyukov, Y.Goldschmidt-Clermont, A.Grant, D.Johnson, F.Kroner, I.Lehraus, R.Matthewson, C.Milstone, V.Nikolaenko, Y.Oren, Y.Petrovikh, R.T.Ross, P.Sixel, M.Spyropoulou-Stassinaki, A.Stergiou, W.Tejesy, P.Theocharopoulos, G.Vassiliadis, P.R.S.Wright, J.Zoll.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.339-56 (1 April 1983).

Fast secondary particles from interactions of K⁺ at 70 GeV/c and K⁻ at 110 GeV/c in the BEBC hydrogen bubble chamber are identified by use of the relativistic rise of ionization in argon. The ionization is measured in a large multicell ionization counter system, the external particle identifier (EPI). The operation of this hybrid system, the calibration and the procedures of off-line analysis leading to particle identification are described. For a sample of 9283 secondary particles collected in the K⁺ p experiment the authors present the measurements of ionization, and the determination of acceptance and identification efficiencies. The momentum-dependent populations of pions, kaons and protons have been obtained. Track by track identification procedures yielding samples of pions and kaons with a contamination $\leq 12\%$ are discussed. A study of the resolution of the EPI in these experimental conditions shows average values in a range of 7.6% of 11% depending on the number of ionization samples remaining after removal of background. These values extrapolate to a value consistent with the 6.6% FWHM measured over the whole device for single particles during calibration with a 50 GeV/c π^- beam. (13 refs.)

60534 Small high-precision wire chambers for the measurement of pp elastic scattering at the CERN collider. J.Buskens, B.Koene, L.Linssen, P.Rewiersma, H.Schuijlenburg, R.van Swol, J.Timmermans (NIKHEF-H, Amsterdam, Netherlands), M.Hagenauer, G.Roiron, J.Velasco.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.365-78 (1 April 1983).

The authors describe the construction and performance of a set of small wire chambers for the detection of elastically scattered particles at the CERN pp collider. A chamber contains four drift planes followed by a multiwire proportional plane with charge division readout. The chamber wall facing the beam axis of the collider consists of a thin plate with field restoring strips that keep the resolution and efficiency of the chamber nearly unchanged to within one millimeter from the wall. The intrinsic resolution of the drift planes is ~ 80 μ m per wire while after track reconstruction an accuracy per wire of ~ 100 μ m is obtained. The accuracy of the charge division is ~ 0.4 mm over a wire length of 64 mm. This number includes uncertainties in the calibration of the readout electronics. (13 refs.)

60535 Spatial resolution of induction chambers. A.E.Bondar, A.P.Onuchin, V.S.Panin, V.I.Telov (Inst. of Nuclear Phys., Novosibirsk, USSR).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.379-88 (1 April 1983).

The spatial resolution of proportional chambers with the delay line connected to the cathode plane has been studied. A coaxial cable was used as a delay line. For the relativistic electrons a spatial resolution of 25 μ m (RMS) for normal incidence and 120 μ m for an angle of inclination of 35° has been obtained. For protons with an energy of 65 MeV a spatial resolution of 15 μ m has been achieved for normal incidence. The factors that limit the accuracy of the method are discussed. (26 refs.)

60536 A variable geometry high-purity germanium detector telescope system for use with intermediate energy charged particles. D.L.Friesel, B.S.Flanders (Indiana Univ., Bloomington, IN, USA), R.H.Pehl. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.403-15 (1 April 1983).

A versatile variable geometry detector telescope system consisting of silicon surface barrier and high-purity germanium planar detectors has been developed and used at intermediate light ion energies at IUCF for several years. Detailed descriptions of the telescope system and its operational properties are given. The practical experiences of using detectors fabricated from both n- and p-type high-purity germanium for a variety of particles and energies are described along with details of the effects of long-term storage, radiation damage, and radiation damage annealing procedures on detector properties. Diffusion of the Li^+ contact after many radiation damage and anneal cycles is also discussed. (25 refs.)

60537 A large-area xenon gas scintillation proportional counter (GSPC) with timing information for the detection of low energy X-rays. H.P.von Arb, J.Bocklin, R.Dittus, R.Ferreira Marques, H.Hofer, F.Kotmann, R.Schaeren, D.Taqui, M.Walchli (Lab. für Hochenergiephys., ETH-Zürich, Villigen, Switzerland).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.429-35 (1 April 1983).

A large area xenon gas scintillation proportional counter has been developed for the study of low energy X-rays. A time resolution of 40 ns (FWHM) at 5.5 keV was obtained by producing secondary scintillation light in the drift space. A simple model of the processes leading to secondary light production describes the measured time distributions and their energy dependence. The energy resolution at 5.9 keV was 8.8% (FWHM) for collimated X-rays. For a uniform irradiation over the sensitive area of 314 cm², a resolution of 9.5% is obtained after correcting for the pulse height dependence on the position of X-ray absorption. The reduction of pulse height due to small H₂O and O₂ contaminations was measured. (10 refs.)

60538 A technique for constructing scintillation panels with very large areas using granulated NaI(Tl). H.Griffiths (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.449-54 (1 April 1983).

A method has been developed for constructing scintillation panels with very large areas at low cost using granulated NaI(Tl). The panels are equivalent to slabs of sodium iodide, 0.35 mm in thickness giving a quantum efficiency greater than 10% up to a photon energy of 130 keV. Under diffusing lightbox conditions the panels give an output of light 2.5 times greater than that from a single crystal of NaI(Tl). (3 refs.)

60539 Composite neutron recording systems. I.M.Kozlov, O.P.Nikotin, A.S.Chekrenev (Leningrad Technol. Inst., Leningrad, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.821-4 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.39-42 (July-Aug. 1982). [received: April 1983]

Describes the design of a neutron recording system built from a large number of ³He-filled proportional counters of thermal neutrons. A particular logic switching unit is suggested for performing a series of experiments and for adjusting and monitoring the counting characteristic of the system. (4 refs.)

60540 Single-coordinate position-sensitive neutron detector with digital processor. V.I.Gordeli, Yu.B.Zasadych, M.Z.Ishmukhametov, V.I.Lazin, V.E.Novozhilov.

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.825-8 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.42-5 (July-Aug. 1982). [received: April 1983]

Describes a cylindrical ³He-filled position-sensitive proportional neutron detector with a high-resistance wire as anode electrode. The coordinates at which a neutron is recorded by the detector are determined with the aid of two analog-digital converters analyzing the amplitude of pulses obtained from both ends of the anode electrode and with the aid of a special unit including a divider circuit of integers. (6 refs.)

60541 Two-coordinate scintillation hodoscope on the basis of hodoscope photomultipliers. N.K.Vishnevskii, A.I.Ronzhin, V.K.Semenov, B.A.Khachaturov (Inst. of High-Energy Phys., Serpukhov, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.833-6 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.49-52 (July-Aug. 1982). [received: April 1983]

Describes the results of research on a scintillation hodoscope based on hodoscope photomultipliers; the instrument allows the simultaneous measurement of two particle coordinates (X and Y). Owing to its small size and mobility, the two-coordinate photomultiplier hodoscope is used for the operational position guidance of the beam onto the target and the monitoring of beam position, beam shape and beam dimensions in the very region of the polarised target. (6 refs.)

60542 Using scintillation hodoscopes with hodoscope photomultipliers in particle-momentum measurements and in fast sampling. A.N.Vasil'ev, N.K.Vishnevskii, Yu.A.Matulenko, E.A.Monich, S.B.Nurushev, A.I.Ronzhin, V.I.Rykalin, V.K.Semenov, B.A.Khachaturov (Inst. of High-Energy Phys., Serpukhov, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.836-41 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.52-6 (July-Aug. 1982). [received: April 1983]

Presents the results obtained in the use of scintillation hodoscopes with hodoscope photomultipliers in measurements of particle momenta. A setup facilitating particle-momentum sampling on an analog level during a time of about 500 nsec is described. The setup was tested with the electron and pion beams of the synchrotron of the Institute of High-Energy Physics (Serpukhov). (11 refs.)

60543 Matching the spectral characteristics of scintillators and photo-diodes. V.D.Ryzhikov, P.E.Stadnik, Yu.A.Yakovlev.

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.842-5 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.57-60 (July-Aug. 1982). [received: April 1983]

The matching of the spectral characteristics is assessed from the radiation spectra of scintillators and the photosensitivity spectra of photodetectors. It is shown that semiconductor scintillators on the basis of A^{III}B^{VI} compounds (CdS, ZnS and ZnSe) match photodiodes in a better way than CsI(TZ) scintillators which are usually employed in scintillator-photodiode systems. (8 refs.)

60544 A nitrogen-filled ionization chamber. K.M.Avakyan, G.V.Azizbekyan, P.S.Mnatsakanyan.

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.846-9 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.60-2 (July-Aug. 1982). [received: April 1983]

The operation of a nitrogen-filled ionization chamber at various pressures and degrees of gas purity was investigated. Comparative amplitude characteristics of nitrogen- and argon-filled chambers are considered. It is shown that it is possible to use nitrogen in larger ionization chambers. (10 refs.)

60545 Saturation curves of parallel-plate ionization chambers. B.G.Fallone, E.B.Podgorsak (Dept. of Radiation Oncology, McGill Univ., Montreal, Quebec, Canada).

Med. Phys. (USA), vol.10, no.2, p.191-6 (March-April 1983).

A new analytical expression is presented to describe the full saturation curve of parallel-plate ionization chambers. In contrast to the presently known expressions, which hold only for the near saturation region, this empirically determined expression is in excellent agreement with measurements in the whole collection efficiency range from 0 to 1 for X-ray sources with effective energies from 20 to 150 keV and cobalt-60 gamma rays. The dependence of the ion collection efficiency and the extrapolated electric field, which is a parameter in the new saturation curve expression, on electric field, dose, dose rate, beam quality, and chamber volume, is discussed. The effect of photoemission from the chamber polarizing electrode for low-energy X-ray beams on the saturation current is demonstrated. A universal ionization chamber constant is derived experimentally. It is shown that all parameters of the saturation curve equation and thus the saturation curve itself, can be calculated from one single measurement of ionization current at a given electric field and air gap thickness. (17 refs.)

60546 Multi-needle counter with cathode focusing used to detect the thermo-stimulated exoelectron emission (TSEE). G.Comby, J.Quidot, J.F.Chalot, G.Valladas, A.Zadra, M.Petel, J.Barthe (CENS, Gif-sur-Yvette, France).

Rev. Phys. Appl. (France), vol.18, no.4, p.263-70 (April 1983). In French.

The multi-needle detectors with cathode focusing, developed to detect and to localize single photo electrons are specially adapted to reveal events with a very poor number of primary electrons. In exo-emission phenomena each event appears like an emission of 1 to some electrons with a weak energy (~1 eV). This work describes the performances of the multi-needle counters when they are used to detect thermo-stimulated exoelectrons. (13 refs.)

60547 Theoretical analysis of photon drag detectors. J.G.Edwards, A.R.Roddie.

Report NPL-DES-76, Nat. Phys. Lab., Teddington, England (March 1983), 44 pp.

A theoretical analysis of the spatial response characteristics of photon drag detectors used for the measurement of high power pulses from CO₂ lasers is presented. Details of the model and the numerical methods employed are described and the results obtained for several electrode configurations together with a comparison of experimental values obtained for a typical commercial device are given. (10 refs.)

60548 CEDAR counters for particle identification in the SPS secondary beams: A description and an operation manual. C.Bovet, R.Maleyrans, L.Piomontese, A.Placci, M.Placidi.

Report CERN-82-13, CERN, Geneva, Switzerland (23 Dec. 1982), vi+37 pp.

The Cerenkov differential counter with achromatic ring focus (CEDAR) has been designed and a number built at CERN for the identification (and selection) of particles in the secondary beams of a high-energy accelerator. CEDAR-N can separate kaons from pions up to 300 GeV/c but can detect protons only down to 60 GeV/c; CEDAR-W can flag protons of 12 GeV/c and separate kaons from pions up to 150 GeV/c. After a brief account of the relevant physics of the Cerenkov effect, this report describes CEDARs with emphasis on those characteristics and construction features that are of interest to the user. Details are given of the high-precision optical system, the mechanical construction to achieve uniform temperature (0.1K) and rigidity, and the gas handling and measurement. The layout of the CEDARs in the secondary beams of the CERN Super Proton Synchrotron is described. The signals provided to the user are listed and explained, together with the programs for on-line control of the counters. Details are given of the performances attained, together with various hints and suggestions on the procedure to follow in order to set-up, tune, and operate a CEDAR. The dependence of the performance on beam optics is stressed. (10 refs.)

60550 Controllable scanner for an automatic nuclear photoemulsion analyzer. V.A.Grashilin, Yu.Ya.Karlyshev (Inst. for Nuclear Studies, Acad. of Sci., Kiev, Ukrainian SSR).

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.874-6 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.87-9 (July-Aug. 1982). [received: April 1983]

A controllable scanner is described for use in an automatic device for counting grains on nuclear photoemulsions. The scanner is designed from digital-to-analog converters and can count a 512×512 frame in ~ 2.6 sec. The controllable sweep generator load consists of the beam-deflecting system of an OS-110LA oscilloscope and has conversion accuracy $\pm 1/2$ the lowest significant bit of the digital-to-analog converter. (8 refs.)

60551 Simple circuit for dynamically displaying digital data from one or several counters. S.U.Klimovich, Yu.P.Surkov.

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.877-9 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.90-2 (July-Aug. 1982). [received: April 1983]

A dynamic digital display is described which does not use synchronizing circuits. The display unit consists of four electronic switches (series 155 microcircuits), a 4-way pulse distributor, and four 514ID2 decoders. It is shown that it is possible to employ just one 514ID2 decoder. The data inputs of the counters whose states are displayed are functionally independent of the display conditions. Data from each counter are displayed decade-by-decade 50 times per second using a pulse distributor. The display device can record data decade-by-decade by connecting a code converter to the outputs of the electronic switches and by disabling the pulse distributor during the time needed to print out the data stored in a counter decoder. (1 ref.)

60552 Doppio discriminatore leading edge (Double leading edge discriminators). M.Castoldi.

Report INFN/TC-82/13, Ist. Naz. Fis. Nucl., Genoa, Italy (13 Oct. 1982), 5 pp. In Italian.

A double leading-edge discriminator for general use in particle counting is described which, though not of high precision or extremely accurate timing, can be used in the 'updating' and 'burst guard' modes, and can be easily and economically manufactured, being made up of standard ECL series 10000 components and includes power supplies.

60553 Particle identification by means of fine sampling dE/dX measurements. A.Imanishi, T.Ishii, T.Onshima, H.Okuno, K.Shiino (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), F.Naito, T.Matsuda.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.357-64 (1 April 1983).

Identification of relativistic charged particles by means of fine sampling dE/dX measurements with a longitudinal drift chamber has been studied. Using a fast-sampling ADC (25 MHz), dE/dX was measured in a 1.4 mm gas thickness over an electron drift space of 51 mm. For the simulated 1 m long tracks of pions and electrons of 500 MeV/c, a particle separation of 10σ - 12σ has been obtained, where σ is the RMS resolution of the dE/dX measurement. This result with fine sampling is better by a factor of 1.7 compared to the dE/dX measurement with 21 mm sampling thickness. Further improvement achievable by reducing the correlation between neighbouring samples and simplification of electronics by use of the δ -ray clipping method are also discussed. (9 refs.)

60554 Deposited energy density for 100 MeV protons in lithium. K.B.Winterbon (Chalk River Nuclear Labs., Chalk River, Ontario, Canada).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.469-73 (1 April 1983).

The density of energy (LET) deposited in a lithium target by 100 MeV protons is estimated by two methods. The protons are slowed down by electronic stopping alone, nuclear stopping being negligible. Multiple scattering and transport of energy by recoil electrons (delta rays) are shown to be negligible. The continuous-slowing-down expression for the range straggling is used in a convolution with the no-straggling distribution in one method; in the other the appropriate transport integral equation is solved to first order in the straggling. The corresponding solution for the range distribution is also given. The results are nearly identical, numerically. The peak energy density is about 4.8 times the mean, and the FWHM is about 5.4% of the mean range. In the corresponding problem for 200 MeV protons on lead, the numbers are 4.4 and 6.3%, respectively. Simple scaling relations for peak and FWHM are given in terms of a straggling parameter. (8 refs.)

60555 The influence from low energy X-rays and Auger electrons on $4\pi\beta\gamma$ coincidence measurements of electron-capture-decaying nuclides. E.Funck, A.Nylandstedt Larsen (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).

Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.3, p.565-9 (March 1983). The influence of low energy X-rays and Auger electrons emitted by electron capture nuclides on $4\pi\beta\gamma$ coincidence measurements is investigated. Under the assumption that these radiations are not detected, correction terms are developed for a number of nuclides that are in common use. (13 refs.)

60556 Determination of the specific activity of fission-based ^{99}Mo using differential pulse polarography. R.K.Barnes, E.L.R.Hetherington (Australian Atomic Energy Comm., Res. Estab., Lucas Heights Res. Labs., Sutherland, NSW, Australia), M.Ohkuho.

Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.3, p.603-6 (March 1983). The specific activity of fission-based ^{99}Mo is significantly lower than the theoretical 'carrier-free' value because of the contribution from a number of stable molybdenum isotopes which are formed concurrently during irradiation of the uranium target. A rapid analytical technique employing differential pulse polarography was devised to measure the concentrations of molybdenum, and hence the specific activity of ^{99}Mo , in small volumes of radioactive sample. Submicrogram quantities of the analyte can be measured by using the catalytic reduction wave of molybdenum in a nitric acid-ammonium nitrate based supporting electrolyte. Measured specific activities range from 3.1×10^6 to 5.4×10^6 Ci g $^{-1}$; these values were in close agreement with the theoretically computed values. (12 refs.)

60557 Standard radiometer for long-lived radionuclide aerosols. S.K.Belkina, Yu.E.Zalmanzon, V.D.Kamyshchenko, Yu.V.Kuznetsov, D.E.Fertman.

Meas. Tech. (USA), vol.25, no.7, p.626-7 (July 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.7, p.63-4 (July 1982). [received: Feb. 1983] A standard radiometer is shown which can be used in checking, calibrating, and certifying working means of monitoring the bulk activities of aerosols for long-lived radionuclides. In particular, it has been used in calibrating and certifying units for detecting β -active aerosols having a measurement range of $3.7 \cdot 3.7 \times 10^4$ Bq/m 3 . The approach used in creating the standard radiometer enables one with relatively little effort to design a standard radiometer for the vapor of molecular iodine-131 using the new BDAG-01R detection unit. (5 refs.)

60558 Observation of large deviations from the Bethe-Bloch formula for relativistic uranium ions. S.P.Ahlen, G.Tarle (Dept. of Phys., Univ. of California, Berkeley, CA, USA).

Phys. Rev. Lett. (USA), vol.50, no.15, p.1110-13 (11 April 1983). By measuring the range deficit of 955-MeV/u ^{238}U ions in copper, the authors have identified very large deviations of the stopping power from the standard Bethe-Bloch formula. They show that this discrepancy can be accounted for by higher-order terms in the Mott cross section and by the relativistic Bloch correction. The significance of this result with regard to two high-energy astrophysics experiments is discussed. (22 refs.)

29.90 OTHER TOPICS IN HIGH-ENERGY AND NUCLEAR EXPERIMENTAL METHODS AND INSTRUMENTATION

60559 Survey measurements of the magnetic field of the University of Manitoba spiral ridge cyclotron. J.Bruckshaw, V.Derenchuk, I.Gusdal, J.Lancaster, A.McLwain, S.Oh, S.Pogson, J.S.C.McKee (Cyclotron Lab., Univ. of Manitoba, Winnipeg, Manitoba, Canada).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.493-5 (1 April 1983).

A magnetic field mapping system having 52 flipping coils has been developed at the University of Manitoba. Measurements were made in vacuo with an estimated relative error of $\pm 0.04\%$. (12 refs.)

60560 Standard interfaces for program-modular multiprocessor systems (review) [nuclear physics application]. E.V.Chernykh (Joint Inst. for Nuclear Res., Dubna, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.783-816 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.5-35 (July-Aug. 1982). [received: April 1983]

Interfaces for multiprocessor systems used in nuclear physics experiments are dealt with. The CAMAC system crate has found application in major physics laboratories in the world. Drafts of the interface standards for COMPLEX, E3S, and FASTBUS have been written under the aegis of the EOSNE and NIM committees. The common structural characteristics of multi-processor-system interfaces are identified and the various interfaces are composed on the basis of their throughput and relative cost. (50 refs.)

60561 Momentum space properties of atoms. A.Harmalkar, A.M.Simas, V.H.Smith, Jr., W.M.Westgate (Dept. of Chem., Queen's Univ., Kingston, Ontario, Canada).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.811-20 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

A systematic investigation of momentum densities $\bar{n}(p)$, Compton profiles $J(q)$, and internally folded densities $B(r)$ has been made for the ground states of the atoms from H to Kr. The data are presented in reduced form by means of the characteristic momentum $p^* = q^*$ and length $r^* = 1/p^*$, where $p^* = [J(0)/2\pi I(0)]^{1/2}$. The results indicate that p^* and $J(0)$ contain the gross

qualitative behavior of the atomic properties in momentum space. They also show that subtle effects over and above the gross scale and size are mostly periodic. (10 refs.)

31.15 GENERAL MATHEMATICAL AND COMPUTATIONAL DEVELOPMENTS

60562 Recent advances in simple valence-bond theory and the theory of hybrid bond orbitals. Z.S.Herman (Linus Pauling Inst. of Sci. & Medicine, Palo Alto, CA, USA).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.921-43 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The history of important developments in the theory of hybrid bond orbitals and its application in valence-bond theory is reviewed. One of the salient points, the bond strength of a hybrid orbital, is defined as the value of the angular part of the orbital along the bond direction. Characteristic bond angles corresponding to maxima in the bond strength are presented for various basis sets. In order to alleviate computational difficulties in determining the bond strength for complex systems, an approximation to it, the pair-defect-sum approximation, is described. The results of an exhaustive test of the validity of this approximation are presented. Applications of these ideas to coordinate chemistry are provided. Finally, the case is made for the continued viability of valence-bond theory in this age of omnipresent computer terminals. (97 refs.)

31.20 SPECIFIC CALCULATIONS AND RESULTS

60563 Two-dimensional fully numerical solutions of molecular Hartree-Fock equations: LiH and BH. L.Laaksonen, P.Pyykko, D.Sundholm (Dept. of Phys. Chem., Abo Akad., Abo, Finland).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.1-3 (25 March 1983).

A fully numerical Hartree-Fock approach is developed for diatomic molecules. The exchange potential is solved relaxing a local, Poisson-like equation. Improved Hartree-Fock limits are reported for LiH and BH. (12 refs.)

60564 The self-interaction-correlated local spin density approximation. A case of too much correlation?. J.G.Harrison (Dept. of Phys., North Dakota State Univ., Fargo, ND, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.181-2 (1 April 1983).

The author carried out total-energy calculations for atoms from H to Ar using the exchange-only (XO) version of Perdew's (1979) orbital self-interaction-correction functional. The author finds that for atoms beyond oxygen, this functional yields better total energies than the full exchange-correlation version. (8 refs.)

60565 Dynamic model and tunneling splittings in LMH₄ non-rigid hydrides. L.Ya.Baranov, A.I.Boldyrev (Inst. of new Chem. Problems, Acad. of Sci., Chernogolovka, USSR).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.218-22 (1 April 1983).

A non-rigid model for the molecules LiBH₄, NaBH₄, LiCH₃⁺ is suggested on the basis of ab initio data. The model is used in numerical calculations of the levels of large-amplitude deformation-migration motion of the cation in these molecules. It is shown that the lowest states can be regarded as highly anharmonic bending vibrations, while levels above the barrier should be considered as hindered rotation of the MH₄ group. T_d symmetry is used to classify the states. Tunneling splittings of the vibrational states are 0.01-1 cm⁻¹. (7 refs.)

60566 Channel coupling theory of molecular structure: explanation and elimination of unphysical results. W.K.Ford (Xerox Webster Res. Center, Rochester, NY, USA), J.Sherzer, F.S.Levin.

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.223-7 (1 April 1983).

Earlier (LCAO) structure calculations for H₂⁺ ungerade and H₂ triplet states based on the channel coupling array (CCA) theory of many-particle collisions have yielded unphysical potential energy curves. It is shown for H₂⁺ that this is a result of not requiring the CCA wavefunction components to obey a certain boundary condition. A simple ansatz obeying this condition is constructed and shown to yield a physically correct, approximate ungerade potential energy. (17 refs.)

60567 Unusual low-energy isomers for simple radical cations. M.J.Frisch, K.Raghavachari (Dept. of Chem., Carnegie-Mellon Univ., Pittsburgh, PA, USA), J.A.Pople, W.J.Bouma, L.Radom.

Chem. Phys. (Netherlands), vol.75, no.3, p.323-9 (15 March 1983).

The radical cations of formalimine, methylamine, formaldehyde, methanol, diazene, hydrazine, nitroxyl, hydroxylamine and hydrogen peroxide, and of isomers derived formally from these systems by means of a 1,2-hydrogen shift have been studied using ab initio molecular orbital theory, including electron correlation. For the ions of formalimine, methylamine and methanol, evidence is presented that the 1,2-hydrogen-shifted species lie lower in energy than the conventional isomers. (30 refs.)

60568 A combination of pseudopotentials and density functionals: results for Li^{m+}, Na^{m+} and K^{m+} clusters (n≤4; m=0.1). J.Flad, G.Igel, M.Dolg, H.Stoll, H.Preuss (Inst. für Theoretische Chem., Univ. Stuttgart, Stuttgart, Germany).

Chem. Phys. (Netherlands), vol.75, no.3, p.331-45 (15 March 1983).

Semi-empirical pseudopotentials, corrected for core polarization, and local density functionals, corrected for self-interaction, are used in valence-only SCF calculations for neutral and singly ionized Li, Na and K clusters with up to four atoms. Results are given for structures, binding and ionization energies. Trends are discussed with special emphasis on the role of core-valence correlation. Comparison is made with accurate ab initio CI calculations where possible. (46 refs.)

60569 Cluster expansion of the wavefunction. Valence and Rydberg excitations, ionizations, and inner-valence ionizations of the CO₂ and N₂O studied by the SAC and SAC CI theories. H.Nakatsuji (Dept. of Hydrocarbon Chem., Kyoto Univ., Kyoto, Japan).

Chem. Phys. (Netherlands), vol.75, no.3, p.425-41 (15 March 1983).

Valence and Rydberg excitations, ionizations, and inner-valence ionizations of CO₂ and N₂O, which are isoelectronic, are studied by the SAC and SAC CI theories. The author has given a systematic assignment of the electronic spec-

tra of these molecules, though there were some controversial situations in the assignment of the spectra. The broad and overlapping features of the spectra of the inner-valence ionizations are due to the existence of a large number of ionization-excitation states mixing with the singly ionized states. The theoretical origins of the similarities and differences in the photoelectron spectra of CO₂ and N₂O are clarified. (48 refs.)

60570 Effective handling of a large configuration state function expansion for an MCSCF state and improved efficiency for two-electron integral transformations in MCSCF. J.Olsen, D.L.Yeager (Dept. of Chem., Texas A & M Univ., College Station, TX, USA).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.789-809 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

Effective solutions for two difficulties which may be present in MCSCF calculation are discussed: (i) The authors show how the large configuration state function state expansion case may be handled simply and effectively without the introduction of extraneous projection operators or Lagrange multipliers; (ii) they present a simplified two-electron integral transformation procedure which significantly reduces the operation count (and hence computational efficiency is increased) for second order and particularly for third order MCSCF procedures. The procedures they introduce use some freedom available in the orthogonal complement CI space and the virtual orbital space to simplify MCSCF calculations. (31 refs.)

60571 Improved SCF interaction energy decomposition scheme corrected for basis set superposition effect. W.A.Sokalski, S.Roszak, P.C.Hariharan, J.J.Kaufman (Dept. of Chem., Johns Hopkins Univ., Baltimore, MD, USA).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.847-54 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

A modified scheme for SCF interaction energy decomposition has been proposed where the nonphysical basis set superposition error (BSSE) has been corrected by means of the counterpoise method. A new procedure to separate the exchange and induction energy terms of nonphysical BSSE has been tested in the case of the H₂O dimer. The first order BSSE appears to be nonnegligible for strong hydrogen bonded complexes. In addition the scheme allows separation of the long-controversial charge-transfer contribution within the induction term, which has been considerably overestimated in previous studies. (26 refs.)

60572 Ordinary field-theoretic methods for self-consistent wave functions which describe bond formation and dissociation. II. Commutative coupling case. W.B.England (Dept. of Chem., Univ. of Wisconsin, Milwaukee, WI, USA).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.905-14 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

For pt.1, see J. Phys. Chem., vol.86, p.1204, (1981). Hartree-Bogoliubov-Valatin (HBV) theory may be implemented with Lipkin Hamiltonians to obtain self-consistent BCS wave functions which describe bond formation and dissociation. These wave functions are in turn vacua for Nambu's representation of Feynman-Dyson-Goldstone diagrammatic perturbation theory, and hence provide suitable references for the many-body treatment of correlation. Exact SCF solutions of the HBV equations are equivalent to special even-replacement MC-SCF solutions. The latter are similar to generalized valence bond theory, and require one Fock operator for each one-particle shell. The commutative coupling case of HBV theory is realized when the number-conserving renormalized one-body and number-nonconserving pairing operators commute. In this case, a set of orbital equations which involves a single Fock operator may be solved. Since this could prove to be a significant simplification for large systems, the commutative coupling and exact solutions are compared here for the fragmentation of H₂ and F₂. Results suggest that commutative coupling orbitals will be useful for the aforementioned many-body theory. (42 refs.)

60573 Ab initio MO investigation of the ethanolamine-formic acid complex. T.Solmajer, M.Hodoseck, D.Hadzi (LEK, Chem. & Pharmaceutical Works, Ljubljana, Yugoslavia).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.945-52 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The title complex is considered a model for the interaction of catecholamine-type ligands with anionic sites of receptors. It is usually assumed that the ligands interact in the protonated form, but there is no direct evidence of this. Model computations of proton transfer processes should contribute to the elucidation of this important problem. As a first step in this direction the authors have made computations in the STO-4G base of the interaction energies, molecular electrostatic potentials, the potential curves, and the Mulliken population for three different arrangements of the acid and base molecules. Proton potential functions have also been computed for the complexes with two water molecules attached to the acid. The deeper potential well is nearer to the carboxylic oxygen in all cases examined. (27 refs.)

60574 Computer-generated formulas for some three-center molecular integrals over Slater-type orbitals. H.W.Jones (Dept. of Phys., Florida A & M Univ., Tallahassee, FL, USA).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.953-7 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

Exact computer-generated formulas can be produced for each term of an infinite series that gives the value of three-center Coulomb integrals over Slater-type orbitals of the s-type with equal screening constants. As a specific example, the Coulomb energy of an equilateral triangular arrangement of all 1s orbitals is calculated using seven terms of an infinite expansion to obtain an answer comparable to earlier work in elliptic coordinates. Generalization to all three-center cases of this implementation of the Lowden α -function method is straightforward. (8 refs.)

60575 Multiconfigurational Hartree-Fock response functions. P.Jorgensen, P.Swanstrom (Dept. of Chem., Aarhus Univ., Aarhus, Denmark), D.L.Yeager, J.Olsen.

Int. J. Quantum Chem. (USA), vol.23, no.3, p.859-71 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The linear, quadratic, and cubic response of a multiconfigurational Hartree-Fock state to a time independent one-electron perturbation has been derived. A comparison between the exact response functions as obtained from Rayleigh-Schrodinger perturbation theory and the multiconfigurational Hartree-Fock response functions allows an identification of matrix elements of the perturbation operator between the ground and excited states and between excited states. The authors discuss some ambiguities which result from such an identification. (18 refs.)

60576 Scaling in pseudopotential theory. R.Gaspar (Inst. fur Phys. Chem., Univ. Göttingen, Göttingen, Germany). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.1017-24 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982). Simple Gaussian nonlocal pseudopotentials are determined for K shells. Extrapolation formulas are derived for the parameters as functions of the reduced atomic number. Small hybrids are used for the basis function analysis. Comparison is made with the set of molecules in the book by Snyder and Basch (1972) and detailed results are presented for the molecules BH_3 , CH_4 , NH_3 , H_2O , HF , N_2 , CO , BF , CH_3F , C_2H_2 , HCN , CHONH_2 , and CHOOH . Results on energy levels, total energy, total valence energy and dipole moment and in a few cases some geometry predictions are made. (8 refs.)

60577 Molecular orbital study of the homocyclopropenyl cation. R.C.Haddon, K.Raghavachari (Bell Labs., Murray Hills, NJ, USA). *J. Am. Chem. Soc. (USA)*, vol.105, no.1, p.118-20 (12 Jan. 1983). The homocyclopropenyl cation is the simplest homoconjugated system and the first species for which homoaromatic character was involved. The authors hypothesize that at high alkane concentration H abstraction by free and π -complexed chlorine atoms occurs. (19 refs.)

60578 Restatement of conventional electronic wave function determination as a density functional procedure. M.R.Nyden, R.G.Parr (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4044-7 (15 March 1983). It is shown how any conventional ground-state electronic wave function determination starting from a basis set of orthonormal spatial orbitals f_k may be restated as a density functional procedure. Write $f_k = (\rho/N)^{1/2} \exp(i\theta_k)$, with ρ the total electron density, N the number of electrons, and θ_k a function which may have complex as well as real parts. All matrix elements are then expressible as functionals of ρ and the θ_k . Orthonormalization gives $[\rho \exp(-i(\theta_k - \theta_l))] dr = N\delta_{kl}$. With these conditions imposed as constraints, the variational process for determining the energy is equivalent to a procedure for starting from a guessed ρ , determining the θ_k , determining ρ again, and iterating, with the energy decreasing at each stage. The equations are given and discussed in detail for the four-electron Hartree-Fock problem for which the two orbitals are $\phi_1 = (\rho/4)^{1/2} \exp(i\theta)$ and $\phi_2 = (\rho/4)^{1/2} \exp(-i\theta)$, with θ real. A graph of θ is given for the atom Be. (12 refs.)

60579 An orthogonality constrained generalization of the Weizsacker density functional model. M.R.Nyden (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4048-51 (15 March 1983). An exact density functional theory for two orbital systems (such as Hartree-Fock beryllium) is extended to give a density functional model for first-row atoms. The new model is related to the Weizsacker model but it includes additional terms which arise from orthogonality constraints. Two approximate methods based on this model are tested numerically. (5 refs.)

60580 Hydrogen bonds between first-row hydrides and acetylene. M.J.Frisch, J.A.Pople (Dept. of Chem., Carnegie-Mellon Univ., Pittsburgh, PA USA), J.E.Del Bene. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4063-5 (15 March 1983). The structures and association energies of the complexes of NH_3 , H_2O and HF with acetylene have been determined using Hartree-Fock and Møller-Plesset theories. HF is found to act as a proton donor to acetylene, while H_2O and NH_3 act as proton acceptors. (13 refs.)

60581 Natural bond orbital analysis of near-Hartree-Fock water dimer. A.E.Reed, F.Weinhold (Dept. of Chem., Univ. of Wisconsin, Madison, WI, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4066-73 (15 March 1983). The authors have carried out a natural bond orbital analysis of hydrogen bonding in the water dimer for the near-Hartree-Fock wave function of Pople, Kistenmacher, and Clementi (1973), extending previous studies based on smaller basis sets and less realistic geometry. They find that interactions which may properly be described as 'charge transfer' (particularly the $n \rightarrow \sigma^*_{\text{OH}}$ interaction along the H-bond axis) play a critical role in the formation of the hydrogen bond, and without these interactions the water dimer would be 3-5 kcal/mol repulsive at the observed equilibrium distance. They discuss this result in relationship to Klemperer's general picture of the bonding in van der Waals molecules, and to previous theoretical analyses of hydrogen bonding by the method of Kitauro and Morokuma (1976). (32 refs.)

60582 States of Am in aqueous solution. Won Mok Jae (Hanyang Univ., Seoul, Korea). *J. Korean Nucl. Soc.*, vol.14, no.4, p.172-7 (Dec. 1982). [received: April 1983]

The states of Am in a 10^{-5} M solution has been studied in the pH range of 5 to 10 by filtration and centrifugation methods. Hence the author estimates the possible Am hydrolysis products and solubility constants. If the solubility of $\text{Am}(\text{OH})_3$ estimated by Bacs and Mesmer (1976) is increased about a factor of 10, the calculated curve of Am concentration versus pH is found to agree completely with experimental values. (8 refs.)

60583 Calculation of the polarizability of the sodium atom from the Sturm virtual orbitals of the self-consistent-field method. P.F.Gruzdev, G.S.Soloveva, A.I.Sherstyuk.

Opt. & Spectrosc. (USA), vol.53, no.1, p.1-2 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.3-5 (July 1982). [received: April 1983] A method for constructing a complete system of basis functions of a purely discrete spectrum was proposed previously (see Opt. Spektrosk., vol.42, p.1198, 1977; Opt. Spectrosc., vol.42, p.690, 1977) for the problem of the perturbation of the stationary states of atoms described in the Hartree-Fock approximation. The present authors report the first numerical implementation of this method. An algorithm has been developed and a program written for solving the system of integro-differential equations of the Hartree-Fock method to find the Hartree-Fock eigenvalues and eigenfunctions and also to determine the eigenvalues and virtual orbitals of the Sturm-Liouville problem. For the particular case of the sodium atom, the possibilities for obtaining purely discrete virtual orbitals is demonstrated. (9 refs.)

60584 Theoretical study of the lowest $^2\Sigma^+$ doubly excited state of H_2 . A.U.Hazi (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), C.Derkits, J.N.Bardsley. *Phys. Rev. A (USA)*, vol.27, no.4, p.1751-9 (April 1983). The energy and width of the $1\sigma_g^2\Sigma^+$ state of H_2 are calculated using Feshbach projection operators and the Stieltjes moment method. The results are compared with an analysis of the double minima in the potential-energy curves of the $^2\Sigma_g^+$ Rydberg states. The doubly excited $1\sigma_g^2$ configuration is unstable with respect to autoionization for $R < 2.65a_0$, and the autoionization rate is sensitive to both the value of the internuclear separation and the energy of the emitted electron. 60585 Potassium fluoride and phosphorus acid: ab initio calculations and spectroscopic investigations. J.Emsley, J.Lucas, R.J.Parker (Dept. of Chem., King's Coll., London, England), R.E.Overill. *Polyhedron (GB)*, vol.2, no.1, p.19-24 (1983).

Ab initio calculations including the effects of solvation on the hydrogen bonding interactions between F^- and phosphorus acid, HPO_3H_2 , have been performed, resulting in a value of 61 kJ mol^{-1} for the hydrogen bond energy of $[\text{HPO}_3\text{H}_2\text{F}]^-$. Attempts to show that this species exists in aqueous solution have been made using ^{17}O , ^{19}F and ^{31}P NMR spectroscopy and pH and conductance studies, but these indicate that the principal reaction is an acid-base neutralization. Crystals of $\text{KF.HPO}_3\text{H}_2$ grow from aqueous solution but these are not the same as those from methanol solution which are known to be strongly hydrogen bonded. (30 refs.)

60586 Broken symmetry far from equilibrium in molecules within HF formalism. T.Ficker (J. Heyrovsky Inst. of Phys. Chem. & Electrochem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.3339-41 (15 March 1983).

Considerable interest is currently devoted to the possibility of including relaxation and correlation corrections to the HF solution by lowering the symmetry constraints. The author considers the effects of broken symmetry in HF calculations on valence molecular ions with several symmetry equivalent sites. Ab initio LCAO MO SCF calculations were carried out for the ground, cone, and inner valence hole states of the N_2 molecule. (9 refs.)

60587 Use of the state-averaged MCSCF procedure: application to radiative transitions in MgO . R.N.Diffenderfer, D.R.Yarkony (Dept. of Chem., Johns Hopkins Univ., Baltimore, MD, USA). *J. Phys. Chem. (USA)*, vol.86, no.26, p.5098-105 (23 Dec. 1982).

A state-averaged multiconfiguration self-consistent-field (SA-MCSCF) procedure based on density matrix driven MCSCF algorithm is presented and discussed in terms of its use at the MCSCF/configuration interaction (CI) level. The results will be used to estimate line strengths for specific vibrational levels of the $2^1\Sigma^+$ state. Also presented is a study of the convergence properties of two possible implementations of the SA-MCSCF procedure. It was found that, for a general averaging of several eigenstates, a procedure which includes second derivatives with respect to both orbital and configuration state function parameters is required. (36 refs.)

60588 Molecular and electronic structure of carbonyls of the VIIIth periodic system group. P.Dobryszewski, J.Leszczynski, W.Wojciechowski (Inst. of Inorganic Chem. & Metall. of Rare Elements, Tech. Univ. of Wrocław, Wrocław, Poland).

Mater. Sci. (Poland), vol.7, no.4, p.399-418 (1981). The results of theoretical investigations concerning the molecular and electronic structure of the VIIIth group transition metal carbonyls are reviewed and compared with the experimental data. The properties of the carbonyls of all elements from iron to platinum are discussed as general attributes of the entire group. Special attention is paid to the theoretical quantum mechanical models. (66 refs.)

60589 $X\alpha$, Cr_2 , and the symmetry dilemma. B.I.Dunlap (Naval Res. Lab., Washington, DC, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2217-19 (April 1983). $X\alpha$ calculations (with exchange parameter $\alpha=0.7$) are presented for Cr_2 in which the constraint of inversion symmetry on the one-electron orbitals is avoided. The ground state is antiferromagnetic, $^3\Sigma^+$, with equilibrium separation 2.75 Å, vibrational frequency 110 cm^{-1} , and dissociation energy 1.0 eV. This is in qualitative agreement with the generalized-valence-bond calculation of Goodgame and Goddard (1982). (24 refs.)

60590 Electronic structure of radical ions of polycyclic hydrocarbons. M.M.Mestechkin, V.N.Poltavets (Inst. of Phys. Organic Chem. & Coal Tar Chem., Acad. of Sci., Donetsk, Ukrainian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.2, p.178-81 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.2, p.207-11 (March-April 1982). [received: Feb. 1983]
The ionization potentials of a number of conjugated hydrocarbons, as well as the spin densities in the corresponding radical ions, were calculated in the π -electronic approximation and are compared with the constants of hyperfine splitting on the protons. The method of direct calculation of electronic distribution within the framework of the restricted Hartree-Fock method is used in the calculations. (20 refs.)

31.20N Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCICO methods, etc.)

60591 Quantum study of the ground state of a series of unsaturated boron-nitrogen compounds by the MNDO method. I. Geometries and stabilities. B.Maouche, J.Gayoso (Inst. de Chimie, Univ. des Sci. et de la Technol. Houari Boumediene, Dar-El-Beida, Algeria). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.891-904 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

A MNDO study of molecular geometries, enthalpies, formation, atomization, bond separation, and hydrogenation of a series of unsaturated boron-nitrogen compounds, linear with two and three members and cyclic with three, four, five, and six members are presented. For all these molecules, MNDO calculations are in excellent agreement with available ab initio calculations or experimental data. The high rotational barrier in aminoborane H_2BNH_2 , 30.6 kcal/mol, and the length of bond in iminoborane HBNH , 1.183 Å, imply strong double and triple BN bond character in these two molecules. In the odd membered heterocycles, examination of the molecular geometries and energies of equilibrium states shows that in all cases, the stability of the compounds grows with the number of boron atoms and decreases with that of the nitrogen atoms. Moreover, compared study of the two BN-fulvenes with their homologous hydrocarbon shows that only BN (BB)-fulvene has a polyenic structure to that of fulvene. (43 refs.)

60592 Transmission mechanisms of spin-spin coupling constants within the CHF approximation: their study using inner projections of the polarization propagator. A.R.Engelmann, R.H.Contreras (Dept. de Fisica, Univ. de Buenos Aires, Buenos Aires, Argentina). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.1033-45 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

A new method for separating differently transmitted components of spin-spin coupling constants is introduced which is suitable when couplings are calculated using the coupled Hartree-Fock (CHF) approximation via the polarization propagator. Contribution transmitted through different electronic subsystems are found choosing different subsets of orbitals with their corresponding virtual spaces for their description. Examples for two different channels of transmission are given, which are very well known among NMR spectroscopists, namely, components transmitted via π -electron systems, and 'through-space' interactions. In the first case a set of canonical orbitals is chosen, while in the latter noncanonical ones are used. For both cases, numerical results are given within the INDO approximation. These results are compared with others obtained previously by means of the partially restricted molecular orbital approach. The possibility of using this method of inner projections of the polarization propagator in decomposing other second order properties is suggested. (37 refs.)

60593 : A quantum mechanical investigation of clathrate compounds with He and Ne. A.B.Bolotin, V.A.Bolotin, M.-L.Z.Balyavichus, B.F.Gantmakher, E.P.Stumbris, V.M.Tatevskii, E.I.Shapiro, S.S.Yarovoii (Vilnius State Univ., Vilnius, Lithuanian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.2, p.182-5 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.2, p.212-15 (March-April 1982). [received: Feb. 1983]

One of the problems of the present work was to determine the parameters of the semiempirical method on the basis of a comparison of the results of nonempirical calculations on the HeH^+ and NeH^+ molecular ions with calculations carried out in the CNDO/2 approximation. In the study of clathrate compounds, the elucidation of the pathways and the conditions for the insertion of the inert gases He and Ne, which possess the smallest volume in comparison with the other atoms of this group, into a convenient cage, the cubane molecule (C_8H_8), is a natural step. Hence, the second task consisted of studying the stability of the clathrates formed between cubane and He or Ne. (8 refs.)

31.20P Other semi-empirical calculations (Hückel, generalized Hückel, PPP methods, etc.)

60594 Application of the many-body perturbation theory by using localized orbitals. E.Kapuy, Z.Csepes, C.Kozmutza (Phys. Inst., Tech. Univ. Budapest, Budapest, Hungary). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.981-90 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).
Diagrammatic formulation of the many-body perturbation theory is investigated when both the occupied orbitals and the virtual ones are localized, i.e., they are unitary transforms of the canonical Hartree-Fock orbitals. All diagrams representing ground state correlation energy can be generated through fifth order. For cyclic polyenes C_6H_6 and $\text{C}_{10}\text{H}_{10}$ as model systems, the energy corrections are calculated in the Pariser-Parr-Pople approximation for a wide range of the coupling constant β^{-1} , through fourth order including some fifth order terms. The results are compared to those obtained by other methods: perturbation theory by using canonical orbitals and full CI. The effect of neglecting contributions from orbitals localized into neighbouring sites is also studied. (28 refs.)

60595 Excited states of linear polyenes in the SCF-RPA method. M.Baldo, R.Pucci, P.Tomasello (Istituto di Fisica, Univ. di Catania, Catania, Italy). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.1111-19 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

In the framework of the PPP Hamiltonian, the authors have studied the low-lying spectra of all trans linear polyenes with the dielectric function method. It is shown that higher order processes, not included in the RPA scheme as local field correction (LFC) and self-energy (SE) effects can be introduced in a effective way by a suitable parametrization of the residual coulomb interaction. This parametrization is fixed along the polyene series both for singlet and triplet states, at variance with previous RPA calculations. Comparison with the most refined CI calculations as well as with the experimental findings shows very good agreement. Furthermore, chain length and geometry dependence of the electron-electron correlation is briefly discussed. (21 refs.)

60596 Theory of electronic structures and lattice distortions in polyacetylene and itinerant Peierls systems. II. Coulomb interaction dependences of the HF ground state, lattice dimerization and ^1Bu excited state in regular trans-polyacetylene. H.Fukutome, M.Sasai (Dept. of Phys., Kyoto Univ., Kyoto, Japan). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.1-19 (Jan. 1983).

For pt.I see *ibid.*, vol.67, no.1, p.41-67 (1982). The authors study the Coulomb interaction dependences of the HF ground state, lattice dimerization and ^1Bu excited state in regular trans-polyacetylene using the PPP Hamiltonian model. The nature of the HF ground state is determined by the relative magnitudes of the on site and nearest neighbour parts and the screening of the longer range part of the effective Coulomb potential. The SSH model has implicitly taken into account the nearest neighbour exchange interaction. The Franck-Condon band gap is mostly determined by the nearest neighbour exchange interaction. The ^1Bu excited state is excitonic. The exciton binding energy is estimated for the effective Coulomb potential with the screened long range part. To explain the observed ^1Bu excitation energy, the short range part of the effective Coulomb potential must be screened by about half compared to the one in small conjugate molecules. The condition for splitting of the exciton into a zwitter ionic pair of charged solitons is discussed. (12 refs.)

60598 Broken-symmetry Hartree-Fock description of deep core and outer valence hole states: the $3d_{\sigma}$ and $4d_{\sigma}$ hole states of Ag_2^+ . M.Benard (Lab. de Chimie Quantique, Univ. Louis Pasteur, Strasbourg, France). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.183-91 (1 April 1983).

Symmetry-adapted and broken-symmetry Hartree-Fock and CI calculations have been carried out on the $3d_{\sigma}$ and $4d_{\sigma}$ hole states of Ag_2^+ at various distances. The Cizek-Paldus (1967) doublet stability problem is investigated. Calculations confirm the reliability of broken-symmetry solutions for core hole states, but show that valence hole states are better described by a CI expansion restricted to single excitations with respect to the zeroth-order description of the ion. (25 refs.)

60599 Optical oscillator strengths of $3p^63d^2 \rightarrow 3p^53d^2 2^{\circ}p^{\circ}$, $2^{\circ}p^{\circ}$ transitions in Co^{8+} , Cu^{10+} and Zn^{11+} ions. S.N.Tiwary (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.333-6 (8 April 1983).
The author has calculated the excitation thresholds and optical oscillator strengths (OOS) for $3p^63d^2 \rightarrow 3p^53d^2 2^{\circ}p^{\circ}$, $2^{\circ}p^{\circ}$ and $2^{\circ}f^{\circ}$ transitions in Co^{8+} , Cu^{10+} and Zn^{11+} ions of the potassium isoelectronic sequence using Hartree-Fock (HF) and configuration interaction (CI) wavefunctions for both initial and final states. The CI values of the length and velocity form of OOS are in good agreement with each other. The trends in the oscillator strengths for the potassium isoelectronic sequences are plotted. (9 refs.)

60600 Cumulative B_k approximation as a method to select configurations for CI calculations of transition energies. M.A.C.Nascimento (Dept. de Fisico-Quimica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.1011-16 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

A cumulative B_k approximation is examined as a method to select configurations for CI calculations of transition energies where all the matrix elements are computed (full CI). The results obtained by this approach indicate that the transition energies are comparable to the ones obtained at the full CI level. Even for truncation errors of 1 mhartree, the transition energies differ from the full CI ones by less than 0.1 eV. (20 refs.)

60601 On the nature of the bonding in Cu_2 —a comment. L. Pauling

(Linus Pauling Inst. of Sci. & Medicine, Palo Alto, CA, USA).
J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3346 (15 March 1983).
For original paper see C.W. Bauschlicher et al., *ibid.*, vol.76, p.6015 (1982). Bauschlicher, Walch, and Siegbahn have reported the results of their theoretical treatment of the structure of the Cu_2 molecule by an SCF-MCSCF-CI treatment. They concluded that the ground state involves a 4s-4s single bond, arising from the $^2\text{S}(3d^{10}4s^1)$ level of each of the two atoms. The author feels that they are good semiempirical arguments to support the thesis that the bond in this molecule is not a single bond, but is instead a triple bond based on the configuration $3d^9 4s^1$ for each of the two atoms. (8 refs.)

60602 On the nature of the bonding in Cu_2 —an ab initio viewpoint.

C.W. Bauschlicher, Jr. (NASA Ames Res. Center, Moffett Field, CA, USA), S.P. Walch, P.E.M. Siegbahn.
J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3347-8 (15 March 1983).
The authors have performed additional calculations on Cu_2 using the basis with f functions derived previously (*ibid.*, vol.76, p.6015 (1982)). In these calculations, a CASSCF calculation is performed, where the two 4s electrons are distributed in all possible ways among the 4s and 4p orbitals. This is followed by a 22 electron singles and doubles CI from the four most important references in the basis of natural orbitals of the CASSCF. (5 refs.)

60603 The nature of hydrogen bonding in the NN-HF, OC-HF, and HCN-HF complexes. M.A. Benz, C.E. Dykstra (Dept. of Chem., Univ. of Illinois, Urbana, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.4052-62 (15 March 1983).
The nature of hydrogen bonding in the complexes NN-HF and OC-HF, as revealed from detailed ab initio electronic structure calculations, is unlike the bonding in the isoelectronic HCN-HF complex. The strong dipole-dipole attraction in HCN-HF is absent in the other two complexes. Competing effects that are possible in all hydrogen bonds are unmasked in NN-HF and OC-HF. Calculations have been performed with a number of large basis sets, extensive treatment of electron correlation, energetic partitioning, and evolution of molecular properties. The potential energy surfaces that were generated demonstrate the linearity of the equilibrium structures, and show roughly comparable flexibility for bending, thus refining somewhat the experimentally inferred picture. In NN-HF and OC-HF, less than one-half of the hydrogen bond strength of each is due to just the interaction of the unrelaxed charge distributions of the monomers; while polarization of monomer electron distributions accounts for most of the remaining attraction. There is consequently a substantial electric dipole moment enhancement. The total correlation effect is responsible for about one-third of the well depth in NN-HF and OC-HF. Charge transfer is unimportant in all three complexes. (98 refs.)

60604 The low-lying $2\Sigma^-$ states of OH. E.F. van Dishoeck (Sterrewacht-Huygens Lab., Leiden, Netherlands), S.R. Langhoff, A. Dalgarno.

J. Chem. Phys. (USA), vol.78, no.7, p.4552-61 (1 April 1983).
Potential energy curves for the two lowest $2\Sigma^-$ states of OH are computed at the configuration-interaction level using four different basis sets. Electronic transition dipole moments connecting the excited $1^2\Sigma^-$ and $2(D)^2\Sigma^-$ states with each other and with the ground $X^2\Pi$ state are presented as functions of internuclear distance. The theoretical absorption oscillator strengths for the $D^2\Sigma^-$ ($v''=0$)— $X^2\Pi(v''=0)$ transition are in good agreement with the empirical value derived from astronomical measurements. The photodissociation cross sections for absorption from the $v''=0$, 1, and 2 levels of the ground state into the continuum of the $1^2\Sigma^-$ state are calculated, and the interstellar and cometary photodissociation rates are derived. (17 refs.)

60605 A theoretical investigation of the bond length of dichromium. R.A. Kok, M.B. Hall (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).

J. Phys. Chem. (USA), vol.87, no.5, p.715-17 (3 March 1983).
Generalized molecular orbital (GMO) and configuration interaction (CI) calculations of dichromium predict a bond length of 1.73 Å. This is in close agreement with recent resonant two-photon ionization spectroscopy results which yielded a bond length of 1.68 Å. (20 refs.)

60606 Theoretical calculation of the lowest electronic excited states of BO_2 . V. Sarawathy, J.J. Diamond, G.A. Segal (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA).

J. Phys. Chem. (USA), vol.87, no.5, p.718-19 (3 March 1983).
Extensive configuration interaction calculations are reported for the first three doublet states of BO_2 . Agreement with available experimental data is excellent and the position of the $\text{C}^2\Sigma_g^+$ state is predicted. (9 refs.)

60607 Comparison of local density functional Hartree-Fock and configuration interaction in the STO-3G orbital basis for some first-row diatomics. T.B. Grimley, V.C. Jyothi Bhasu (Donnan Labs., Univ. of Liverpool, Liverpool, England).

J. Phys. B (GB), vol.16, no.7, p.1125-31 (14 April 1983).
The local density functional (LDF) scheme has been implemented in Gaussian orbital basis sets by modifying GAUSSIAN70. Calculations for H_2 , Li_2 , N_2 and F_2 with the STO-3G basis set show that the LDF scheme is generally better than Hartree-Fock in reproducing bond lengths and vibration frequencies, and is comparable with configuration interaction (CI) in the same basis. Energy changes in the valence electrons are, however, better described with LDF than with CI. STO-3G results for fourteen closed-shell atoms and ions in the LDF scheme are also given. (14 refs.)

60608 The direct CI method. A detailed analysis. V.R. Saunders (Daresbury Lab., SERC, Warrington, England), J.H. van Lenthe.

Mol. Phys. (GB), vol.48, no.5, p.923-54 (10 April 1983).
A thorough analysis of the direct CI method as applied to the case of a general set of reference configurations coupled to all single and double substitutions is presented. It is pointed out that there is no single strategy which proves optimal under all circumstances. A variety of procedures are therefore presented together with rules to enable the selection of the most favourable under a given circumstance. Much emphasis has been placed on organizing the calculations via a series of matrix multiplications, which enables a vector or array processing computer to be used to best effect. Some consideration is given to using an atomic integral (rather than molecular integral) driven scheme for some interactions, thus removing the necessity for a complete transformation of the molecular integrals to a molecular orbital basis, and the advantages and disadvantages of so doing are discussed. Improved procedures for carrying out both full and partial transformations of the molecular integrals are described. A number of test case calculations involving configuration lists of the order of 10^4 have been analysed in detail, to give a clear picture of the cost of the various interaction types which arise, and indicating that integrals carrying two external molecular orbital indices account for approximately 60 per cent of the cost in typical cases. Typically, a calculation involving 10^5 configurations requires approximately two minutes of CRAY-1 computer time, allowing for ten iterations of the diagonalization procedure. The cost of the calculations is found, somewhat surprisingly, to be approxi-

mately linear in the dimension of the configuration space, indicating that calculations involving 10^6 configurations are now quite feasible. (37 refs.)

60609 Resonance scattering theory: application to the broad $\text{He}^- 1s2s2p^2P^0$ resonance. Y. Komminos, G. Aspromalis, C.A. Nicolaides (Theoretical & Physical Chem. Inst., Res. Found., Athens, Greece).
Phys. Rev. A (USA), vol.27, no.4, p.1865-70 (April 1983).

A resonance scattering theory for many-electron resonances is applied to the analysis of the $\text{He}^- 1s2s2p^2P^0$ resonance. The authors have found that multi-configurational Hartree-Fock theory is applicable even in such cases and predicts the Feshbach nature of the state. Furthermore, by including electron correlation and off-energy-shell pseudostates, they demonstrate the strong energy dependence of the width of this resonance. They suggest that this is the reason for the discrepancy of recent theoretical results with experimental ones, the theoretically predicted cross section is asymmetric, whereas the recent experimental one is symmetric but non-Lorentzian. Defining the position and width of the resonance at maximum and half-maximum values of the cross section correspondingly, they find $E_R=20.26$ eV and $\Gamma_R=600$ meV, compared with the experimental values of $E_R=20.27$ eV and $\Gamma_R=780$ meV. 31.30 CORRECTIONS TO ELECTRONIC STRUCTURE

60610 Jahn-Teller-like progressions in the absence and presence of Jahn-Teller distortions. B. Scharf (Dept. of Chem., Ben-Gurion Univ. of the Negev, Beer Sheva, Israel).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.89-92 (25 March 1983).
Prominent progressions of non-totally symmetric modes may ensue in non-linear molecules in electronic transitions involving degenerate states in the absence of Jahn-Teller distortions. In the presence of Jahn-Teller interactions prominent non-Jahn-Teller progressions may result. (46 refs.)

60611 Approximate relativistic calculations within the one-center approximation for the series CH_4 to PbH_4 . A. Aguilar-Ancoño, J.L. Gázquez, J. Keller (Facultad de Química, Univ. Nacional Autónoma de México, México City, México).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.200-3 (1 April 1983).
Using a one-component relativistic theory combined with an $X\alpha\beta$ local exchange, the authors carried out calculations for the series CH_4 to PbH_4 within the spherically symmetric one-center expansion approximation. Bond lengths, breathing force constants, ionization potentials and spin-orbit splitting of the filled valence p shell thus obtained, are found to be in excellent agreement with Dirac-Hartree-Fock results. (20 refs.)

60612 Atomic inner-shell transitions—theory and the need for experiments. B. Crasemann (Chem. Phys. Inst., Univ. of Oregon, Eugene, OR, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.887-90 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The physics of the innermost shells of atoms is qualitatively different in several respects from that of outer electrons. For single deep holes, correlation effects are slight, while the effects of relativity are pronounced and quantum-electrodynamic shifts can be substantial. These relativistic and QED effects can be explored with high precision because many-body aspects are limited and self-consistent-field approaches can be relied upon. Problems of particular current interest concern the screening of the self energy and the effect of the Breit interaction on multiplet splitting and on X-ray hyperfine shifts. Experimental studies as well as calculations of the properties of few-hole and few-electron atomic systems can lead to significant tests of current theory. (27 refs.)

60613 General variation method for the relativistic calculations of atoms and molecules. T. Kagawa (Dept. of Phys., Nara Women's Univ., Nara, Japan).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.973-9 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

Use of the general variation method of Weinstein and MacDonald for the relativistic calculation of atoms and molecules is proposed. It is shown from the numerical calculations for hydrogenlike atomic systems that this method is useful in judging an accuracy of energies and wave functions obtained with a relativistic Hamiltonian whose spectra are not bounded. It is also shown that this method can be used to find spurious solutions such as $1p_{1/2}$ or $2d_{3/2}$ appearing in atomic systems. Problems in extending the method to many-electron atoms and molecules are discussed. (12 refs.)

60614 All-electron relativistic calculations on AgH. An investigation of the Cowan-Griffin operator in a molecular species. R.L. Martin (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Phys. Chem. (USA), vol.87, no.5, p.750-4 (3 March 1983).
The Cowan-Griffin relativistic operator, which retains only the mass-velocity and one-electron Darwin terms of the Breit-Pauli Hamiltonian, has been shown to provide a remarkably good approximation to the more sophisticated Dirac-Hartree-Fock (DHF) approach for many atomic systems. The result of applying the Cowan-Griffin operator in first order to a nonrelativistic self-consistent-field (SCF) wave function expanded in a basis of Gaussian functions is reported for Ag and AgH. Comparisons are made with previously reported numerical wave functions for Ag and with the recent Slater-type-orbital expansion of the DHF wave function for AgH reported by Lee and McLean (1982). (15 refs.)

60615 1/Z expansion calculation of the Bethe logarithm for the ground state Lamb shift of two-electron ions. S.P.Goldman (Dept. of Phys., Univ. of Western Ontario, London, Ontario, Canada), G.W.F.Drake. *J. Phys. B (GB)*, vol.16, no.7, p.L183-7 (14 April 1983).

The leading two terms in the 1/Z expansion of the two-electron Bethe logarithm are calculated by the application of a few finite basis set method. The results can be expressed in the form $\ln(1s^2 S) = \ln[19.77(Z - 0.0063)^2]$. The high-Z behaviour appears to differ from that of a previous variational calculation by Ashamar and Austvik (1976). (18 refs.)

60616 Comments on fine-structure intervals of the $1s^2 2s^2 2p^5$ 2P state in fluorine isoelectronic sequence. J.Hata, I.P.Grant (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England), B.P.Das. *J. Phys. B (GB)*, vol.16, no.7, p.L189-92 (14 April 1983).

The MCDF-EAL method is used to calculate fine-structure intervals of the $1s^2 2s^2 2p^5$ 2P state in the fluorine isoelectronic sequence, and compared with experiment and MCDF-OL results by Kim and Huang (1982). No systematic discrepancies between the theory and experiment are found. (9 refs.)

60617 Sum rules including first order quantum corrections for neutron scattering experiments on isotopic mixtures of monatomic fluids. H.Fredrikze (Interuniv. Reactor Inst., Delft, Netherlands). *Mol. Phys. (GB)*, vol.48, no.5, p.903-22 (10 April 1983).

The sum rules for neutron scattering experiments on monatomic isotopic mixtures are studied. The scattering is separated into a selfpart and a distinct part rather than into an incoherent part and a coherent part. Exact expressions for the moments are derived in terms of polynomials in \hbar^2 . The coefficients in these polynomials are sums of averages of hermitean operators that have a classical analogue. For the interpretation, the coefficients are approximated including first order quantum corrections. It is argued that the separation into coherent and incoherent scattering is not justified in the presence of 'isotopic incoherence'. Approximate expressions for the sum rules are proposed, in which combined averages (over the isotopic composition) appear of the scattering amplitudes and masses of the scattering atoms. These expressions, including first order quantum corrections to the sum rules, are not available in the literature. The importance of correct averaging over the isotopic composition of expressions that involve scattering amplitudes and masses is discussed for the case of a maximum incoherent mixture of ^{36}Ar and ^{40}Ar . (11 refs.)

60618 Relativistic corrections in atomic calculations. I.J.Ketley (Dept. of Maths., Univ. of Southampton, Southampton, England), R.E.Moss. *Mol. Phys. (GB)*, vol.48, no.5, p.1131-3 (10 April 1983).

Despite advances in fully relativistic calculations on atoms and molecules a number of problems remain and such calculations are not yet routine. The estimation of relativistic corrections and effects will continue to be made using non-relativistic wavefunctions and perturbation theory. This note is confined to the one electron problem for which Titchmarsh (1962) has shown that, for certain cases including the hydrogen atom, the relativistic problem may in principle be treated as a perturbed Schrodinger equation and the eigenvalues and eigenvectors expanded as power series in α the fine structure constant. However, when attempts are made to do this in practice, problems are encountered for relativistic corrections of order $mc^2 \alpha^6$ and higher, where mc^2 is the electron rest energy. This is because the Coulomb potential due to a nucleus is singular, so that divergent energy contributions appear and, in addition, delta function contributions arise. If these problems are not recognized, unreliable results may be obtained in numerical calculations, since the cancellation of very large numbers may occur, and also some contributions may be missed. 31.50 EXCITED STATES

60619 Electronic excited state transport among molecules distributed randomly in a finite volume. M.D.Ediger, M.D.Fayer (Dept. of Chem., Stanford Univ., Stanford, CA, USA).

J. Chem. Phys. (USA), vol.78, no.5, p.2518-24 (1 March 1983). A theoretical study of electronic excited state transport among molecules randomly distributed in a finite volume is carried out. Two special cases of the general transport and trapping problem are treated. A truncated series expansion in powers in the chromophore density is used as an approximation for one component systems (i.e. donor-donor transport only). In two component systems of donors and traps, the Forster limit, in which transfer can occur only from donors to trap due to low donor concentrations, is solved exactly for a finite spherical volume. In both cases, the results presented demonstrate that time-dependent observables can be significantly altered in finite volume systems relative to infinite volume systems. These calculations have implications for the interpretation of experiments performed on real finite volume systems, e.g. energy transport among the chromophores of an isolated polymer chain. (15 refs.)

60620 Evidence that the excited-state geometry of diphenylbutadiene is nearly planar. W.A.Yee, J.S.Horwitz, R.A.Goldbeck, C.M.Einterz, D.S.Kliker (Div. of Natural Sci., Univ. of California, Santa Cruz, CA, USA). *J. Phys. Chem. (USA)*, vol.87, no.3, p.380-2 (3 Feb. 1983).

A structural analogue of diphenylbutadiene (DPB), 1,5-diphenyl-2,3,4,6,7,8-hexahydronaphthalene (HHN), was synthesized and its spectral properties

were studied. Absorption and fluorescence spectra indicate that HHN has a ground-state geometry in which the phenyl rings are twisted relative to the polyene unit and a nearly planar lowest excited B_u state geometry. The $S_0 \rightarrow S_1$ spectra of DPB and HHN are similar as are the $T_0 \rightarrow T_1$ spectra. DPB and HHN show temperature dependences of fluorescence lifetimes with similar Arrhenius activation energies and similar radiative decay constants. It is concluded that relaxation of excited DPB occurs from an excited state in which the polyene moiety is nearly planar. (23 refs.)

60621 Dispersion coefficients for atoms in different states. B.Silvi (Lab. de Spectrochimie Moléculaire, Univ. Pierre et Marie Curie, Paris, France), V.Chandrasekharan.

Mol. Phys. (GB), vol.48, no.5, p.1053-66 (10 April 1983). A formalism allowing the calculation of dispersion coefficients between atoms in different excited states is presented. The validity of the integral transformation involving dynamical polarizabilities of each atom at imaginary frequencies is discussed and for this case a partition of the second order energy which allows a partial separation into single centre contributions is proposed. With respect to the interaction of ground state atoms a new contribution, the dynamic induction due to the allowed downward transitions, appears. The C_6 coefficients of $\text{H}_1 + \text{H}_{2s}$, $\text{H}_1 + \text{H}_{2p}$ and $\text{H}_{2s} + \text{H}_{2s}$ are calculated exactly. Approximate formulae are proposed and discussed. Upper and lower bounds are calculated by the method of Pade approximant for the interaction of excited hydrogen with ground state gas atoms. (47 refs.)

60622 Population of the three major exit channels in the $3d$ resonance region of atomic gallium. M.O.Krause (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), F.Cerrina, A.Fahlman.

Phys. Rev. Lett. (USA), vol.50, no.15, p.1118-21 (11 April 1983). The exit channels in the region of the $3d \rightarrow 4p$ resonance of atomic gallium were determined in a photoemission experiment. The population of the three major channels involving $4p$ and $4s$ electrons was measured by the constant-ionization-state method for twenty resonant states between 18.8 and 21.7 eV, and the angular distribution of the emitted electrons was obtained. As a result, an autoionization case in which many resonances and many continua are coupled has been characterized in the most comprehensive experiment to date. (15 refs.)

60623 Hyperfine structure and three-channel quantum-defect theory of $6snd^1D_2$ Rydberg states of Ba. H.Rinneberg, J.Neukammer (Inst. für Atom- und Festkörperphys., Freie Univ. Berlin, Berlin, Germany). *Phys. Rev. A (USA)*, vol.27, no.4, p.1779-89 (April 1983).

The hyperfine structure of $6snd^1D_2$ Rydberg states of $^{135,137}\text{Ba}$ is reported for principal quantum numbers ranging between $n=10$ and $n=50$. From the authors' data, singlet-triplet mixing coefficients have been deduced. A three-channel quantum-defect model has been used to analyze the resonance in singlet-triplet mixing of $6snd^1D_2$ and 3D_2 Rydberg states in the vicinity of the $5d^1D_2$ perturber. For the determination of the scattering matrix, hyperfine-structure data were found to be essential. Good agreement has been achieved between calculated and experimental singlet-triplet mixing coefficients. (21 refs.)

60624 Application of the Faddeev-Watson expansion to thermal collisions of Rydberg atoms with neutral particles. E.de Prunelle (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).

Phys. Rev. A (USA), vol.27, no.4, p.1831-43 (April 1983). The Faddeev-Watson expansion (FWE) for the T operator is applied to the study of thermal collisions between Rydberg atom and neutral atom. These collisions are considered as a three-body problem (the perturber, the Rydberg electron, and its parent core) and it is assumed, as already done in most theoretical works dealing with Rydberg-atom-atom collisions, that the core-perturber interaction can be neglected. Then the evaluation of the FWE first- and second-order terms is made tractable by using an appropriate separable potential for the Rydberg-electron-perturber interaction. The evaluation of the second-order term allows the authors to estimate the importance of taking into account explicitly the Rydberg-electron-core interaction in the expression of the (three-body) T operator for the thermal collisions considered. Detailed calculations for the process $\text{Rb}(n,l=0) + \text{He} \rightarrow \text{Rb}(n',l') + \text{He}$ are presented and discussed. The FWE second-order term has been evaluated for the first time by taking the (two-body) t operator associated with the Rydberg atom (valence electron plus parent core) as the Coulomb potential. The contribution of the FWE second-order term to the scattering amplitude decreases as n increases and is found especially significant when both the momentum transfers involved in the collision are large and the values of l and l' are small. (19 refs.)

60625 Radiative lifetimes of excited states of atoms. Ya.F.Verolain, A.Ya.Nikolaich (A.A. Zhdanov Leningrad State Univ., Leningrad, USSR). *Sov. Phys.-Usp. (USA)*, vol.25, no.6, p.431-47 (June 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.137, no.2, p.305-38 (June 1982). [received: April 1983].

A review of experimental and theoretical studies of radiative lifetimes of excited states of the hydrogen atom, of atoms of alkali metals, and atoms of the copper subgroup is presented. A complete compilation of all published values of radiative lifetimes of all excited states with a critical analysis for every atom is given. The regularities in the variation of radiative lifetimes in spectral series of excited states are brought out and constants of the power-law dependences on the effective principal quantum number are determined. A correlation between the behavior of lifetimes and the effective orbital parameter is established and it is proposed to use this correlation for the determination of the application limits of the power-law constants for evaluation of lifetimes of uninvestigated states. On the basis of a critical analysis of published sources, of the regularities in the variation of lifetimes and of a statistical treatment of values available in the literature, a table of recommended values of radiative lifetimes of excited states of all atoms of the first group is compiled. 31.70 EFFECTS OF MOLECULAR INTERACTIONS ON ELECTRONIC STRUCTURE

(see also 34. Atomic and molecular collision processes and interactions)

- 60626 Satellite structure in the $2p\sigma$ molecular orbital transitions in slow heavy ion collisions. M.P.Stockli (James R. Macdonald Lab., Kansas State Univ., Manhattan, KS, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.916-18 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
- The binding energy of the $2p\sigma$ molecular orbital formed transiently in a slow heavy ion collisions shows a flat minimum at a large internuclear distance. Electronic transitions in this minimum provide a satellite structure in the $2p\sigma$ X-ray continuum. Measurements show that the satellite is only evident at very small collision velocities, since the collision broadening is much larger for asymmetric collision systems than the theory predicts. The present theory of collision broadening takes into account only the linear term of the change in transition energy dE/dR which may not be appropriate in cases where the second term d^2E/dR^2 is likely to be dominant. (12 refs.)

31.70D Environmental and solvent effects

- 60627 Monte Carlo simulation of solvent effects on vibrational and electronic spectra. M.F.Herman (Dept. of Chem., Tulane Univ., New Orleans, LA, USA), B.J.Berne. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4103-17 (15 March 1983).
- Solvent effects on vibrational states are treated in the Born-Oppenheimer approximation. A Monte Carlo procedure is devised for simulating a system in which the vibrations are treated as quantum degrees of freedom and all other degrees of freedom are treated classically. The key to this method is the use of a restructured perturbation theory for solving the vibrational Schrödinger equation at each of the solvent configurations sampled. This method also is used to compute Franck-Condon factors. The methods developed are applied to two different problems. First, solvent effects on vibrational transitions in the ground electronic state are considered. It is found that the frequency shift from the gas phase frequency is to the red at low solvent densities, but to blue at high solvent densities. Secondly, the heterogeneous electronic absorption and emission line shapes are simulated in a variety of model solute-solvent systems and the results are discussed in terms of a simple theoretical model. (31 refs.)
- 60628 Quantum theory of solvent effects on electronic spectra: Predictions of the exact solution of the mean spherical model. K.S.Schweizer, D.Chandler (School of Chem. Sci., Univ. of Illinois, Urbana, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4118-25 (15 March 1983).
- A microscopic quantum statistical mechanical theory for the solvent modification of the electronic spectra of nonpolar solutes is developed. Attention is focused on the solute frequency shift as a function of molecular parameters, solvent dielectric constant, and density. Comparison of the predictions of the quantum theory and dielectric continuum models (Onsager-Botcher and Wertheim) based on the macroscopic reaction field picture are made. Significant differences are found which indicate the importance of solvent structure and nonzero frequency effects absent in the dielectric models. The theory is also applied to several aromatic hydrocarbon molecules in dilute solution with emphasis on the isothermal density dependence of the electronic frequency shift. Generalization of the quantum theory to treat polar solutes is briefly outlined. (30 refs.)

31.70F Potential-energy surfaces for collisions

(see also 82.20K in chemical kinetics, 34.20 Intermolecular forces, 34.50L in beam studies)

- 60629 Molecular structure and photoelectron spectra of H_2S , H_2Se and H_2Te . Effective core potential calculations on ground and valence ionic states. J.Muller, L.J.Saethre, O.Gropen (Inst. of Math. & Phys. Sci., Univ. of Tromsø, Tromsø, Norway). *Chem. Phys. (Netherlands)*, vol.75, no.3, p.395-404 (15 March 1983).
- Hartree-Fock effective core potential calculations have been performed for the neutral ground state (1A_1) and the first three low-lying ionic states (2B_1 , 2A_1 and 2B_2) of H_2S , H_2Se and H_2Te . The computational method enabled the authors to use the same, relatively large, basis for all three molecules. The calculations include potential energy curves for the three ionic states, equilibrium geometries, vibrational frequencies, Franck-Condon factors, and ionization potentials. The results show satisfactory agreement between calculated and experimental values when comparison is possible, and indicate that molecules and ions containing heavy elements may be studied at a satisfactory level with the effective core potential method. (42 refs.)
- 60630 Semiclassical determination of adiabatic barriers on a three-dimensional potential energy surface. E.Pollak (Chem. Phys. Dept., Weizmann Inst. of Sci., Rehovot, Israel), R.E.Wyatt. *J. Chem. Phys. (USA)*, vol.78, no.7, p.4464-76 (1 April 1983).
- A recently proposed method, based on periodic orbits, for finding vibrationally adiabatic barriers and wells in collinear collisions is generalized to the full three-dimensional case. The main idea is a consistent use of the adiabatic approximation—one first solves for the fast vibrational motion to obtain an effective Hamiltonian for the slower bend motion which in turn is solved to obtain an effective Hamiltonian for the overall rotation. The method is applied to the hydrogen exchange reaction. The authors find the bend-vibration adiabatic barrier levels for the $H_2(v=1)$ state. The zero point motion in the bend degree of freedom is found to be substantial (0.1 eV) and is a source for nonnegligible discrepancies between approximate theories such as the infinite order sudden and quasiclassical trajectory approach and exact quantal scattering computations. Having found the barrier levels they are able to evaluate the collision cross section. Their analysis points out that differences between experimental cross sections and theoretical predictions may be due to inaccuracy in the potential energy surfaces. The available surfaces probably overestimate the adiabatic barrier height. (67 refs.)

32.00 ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS

32.20 ATOMIC SPECTRA GROUPED BY WAVELENGTH RANGES

- 60633 Self-broadening of the sodium resonance lines and excitation transfer between the $3P_{3/2}$ and $3P_{1/2}$ levels. J.Huennkens, A.Gallagher (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.1851-64 (April 1983).
 Sodium vapor, in the density range 10^{13} to $5 \times 10^{14} \text{ cm}^{-3}$, was excited by a CW dye laser, tuned 20-150 GHz from either the D_1 or D_2 resonance line. The authors observed a three-peak scattered spectrum, consisting of the Rayleigh component at the laser frequency, and the two fluorescence components (direct and sensitized) at the atomic resonance-line frequencies. Corrections to the Rayleigh signals for anisotropy and polarization effects, and to the fluorescence signals for radiation trapping, were made in order to obtain the ratio of the sum of the total intensities of the two fluorescence components to that of the Rayleigh component. This ratio combined with a measurement of the line-wing absorption coefficient yields the sodium density and the D-line self-broadening rate coefficients [$k_{\text{bb}} = 4.67 \times 10^{-7} \text{ cm}^3 \text{ s}^{-1}$ ($\pm 15\%$) for the D_2 line and $k_{\text{bb}} = 3.07 \times 10^{-7} \text{ cm}^3 \text{ s}^{-1}$ ($\pm 15\%$) for the D_1 line]. Asymmetry in the self-broadened line wings due to fine-structure recoupling was observed. The measured intensity ratio of the D lines, combined with pulsed measurements of the effective radiative decay rates in the presence of radiation trapping, yields the fine-structure collisional-mixing cross section [$\sigma(3P_{3/2} \rightarrow 3P_{1/2}) = 172 \text{ \AA}^2$ ($\pm 18\%$)] at $T \approx 300^\circ\text{C}$. Their results are compared to other experiments and to theory. (51 refs.)
 60634 Two-step optogalvanic spectroscopy of neutral barium: observation and interpretation of the even levels above the 6s ionization limit between 5.2 and 7 eV. P.Camus, M.Dieulin, A.El.Himdy, M.Aymar (Lab. Aime Cotton, CNRS, Orsay, France). *Phys. Scr. (Sweden)*, vol.27, no.2, p.125-59 (Feb. 1983).
 Even parity levels of neutral barium above the 6s ionization limit have been investigated by using a two-step pulsed laser excitation with optogalvanic detection. From the metastable states, $5d6s$, populated by a DC discharge in a heat-pipe vapour, one reaches the $5dnl$ even Rydberg series with J values ranging from 0 to 5, the $6p^2 \text{ } ^1S_0$ state and the low-lying members ($n=7$ and 8) of the $6pnp$ series above the $5d$ limits. The $5dnd$ configurations (18 levels for each n member) are observed from $n=8$ up to $n=45$ using optogalvanic spectra recorded from five intermediate $5d6p$ levels: $^3P_{1,2}$, $^3F_{3,4}$ and 1P_1 . These eighteen series are observed for the first time. Fine structure is resolved up to $n=25$ and has been analyzed using Slater-Condon parametric calculations. In addition, the $5d_{3/2}nJ=1$ and $5d_{5/2}nJ=3$ series are observed up to $n=38$ and 42 respectively, as well as sharp resonances interpreted as $5d_{3/2}nJ=2$ and $5d_{5/2}nJ=1,2$ series up to $n=27$ and $n=28$ respectively. In conclusion, the energies of 636 new levels between 6s and $5d$ limits are

given with their term and configuration identifications. Above the $5d_{3/2}$ limit, broad resonances observed from the $5d6p \text{ } ^1P_1$, $6s7p \text{ } ^1P_1$ and $^3P_{0,1,2}$ intermediate levels have been identified with levels of the $6p7p$ and $6p8p$ configurations using parametric calculations based on the Slater-Condon theory. - 60635 Mn VI spectrum at 140-220 Å. A.N.Ryabiev. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.13-15 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.23-6 (July 1982). [received: April 1983]
 The Mn VI spectrum excited in a three-electrode vacuum spark has been studied with a grazing-incidence vacuum spectrograph with a grating 3 m in radius (3600 lines/mm). The results are used to classify 151 lines corresponding to transitions from the $3dnf$ ($n=4-8$), $3d5p$, and $3p^33d^2$ configurations to the $3d^2$ configuration. The Mn VI ionization potential has been determined from the $3dnf$ ($n=6-8$) series to be $772.250 \pm 150 \text{ cm}^{-1}$. (9 refs.)
 60636 Beam-foil study of the $2s^22p^5 \text{ } ^3P$ and $2s2p^6 \text{ } ^3P$ configurations of Ar IX. M.C.Buchet-Poulizac, J.P.Buchet (Lab. de Spectrometrie Ionique et Moleculaire, Univ. Lyon I, Villeurbanne, France). *Phys. Scr. (Sweden)*, vol.27, no.2, p.99-102 (Feb. 1983).
 The spectrum of Ar IX has been observed in the 450-900 Å wavelength range. A total of 36 lines has been measured. Thirty of them have been classified as transitions between the $2s^22p^5 \text{ } ^3S$, 3P and $3d$ configurations and six other lines have been ascribed to the $2s2p^6 \text{ } ^3P$ configurations. Energy levels of the $2s^22p^5 \text{ } ^3P$ configurations have been deduced. These identifications have been supported by an isoelectronic comparison. Three main lines have been measured. 32.20R X-ray spectra

- 60637 Atomic calculations for the Fe XX X-ray lines. H.E.Mason, A.K.Bhatia (Lab. for Astron. & Solar Phys., NASA, Goddard Space Flight Center, Greenbelt, MD, USA). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.181-92 (April 1983).
 Atomic data are tabulated for the transitions between levels in the $2s^22p^3$ and $2s^22p^23s$, $2s^22p^23d$ configurations of Fe^{19} . The electron collision strengths are calculated using the 'distorted wave' approximation. Theoretical intensity ratios are tabulated for the X-ray lines. New identifications of spectral lines from a solar flare are presented. (15 refs.)
 60638 Widths, shapes and asymmetries of the Mo $K\alpha_1$ and Ag $K\alpha_1$ X-ray lines. J.S.Thomsen (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA). *J. Phys. B (GB)*, vol.16, no.7, p.1171-89 (14 April 1983).
 Analyses the shapes, possible asymmetries and widths of the Mo $K\alpha_1$ and Ag $K\alpha_1$ X-ray lines. The width determination utilises a novel approach, which should be useful in similar experiments. This simple technique is applicable to measurements in the $(1, \pm n)$ positions of the double-crystal (two-crystal) spectrometer with $n > 1$. Under suitable restrictions, subtraction of the experimentally measured widths in the two positions leads to the desired linewidth, with instrumental correction eliminated to first order. It also yields a 'crystal correction term'; for comparison, the value of this term is obtained in terms of the Darwin solution. The effects of the vertical divergence window on width and asymmetry are also considered. Results are applied to the Mo $K\alpha_1$ and Ag $K\alpha_1$ data of Bearden; the respective widths are found as $6.28 \pm 0.07 \text{ eV}$ and $8.97 \pm 0.08 \text{ eV}$, in good agreement with theory. Both lines are found to follow closely the Lorentzian form, with RMS deviations probably within 0.3%. Both lines show small asymmetries of the order of ~ 0.003 , the minus sign indicating greater width on the short-wavelength side. The method of linewidth computation is also applied to the data of Bearden and Shaw for elements 25 Mn through 32 Ge. (35 refs.)
 60639 Origin of the so called spin doublets in X-ray satellite spectra. B.G.Gokhale, U.D.Misra (Phys. Dept., Lucknow Univ., Lucknow, India). *J. Phys. B (GB)*, vol.16, no.7, p.1191-8 (14 April 1983).
 It is pointed out that one should not expect to find spin doublets in X-ray satellites since the level system of two-hole atoms should consist of singlets and triplets. The energies of the two-hole multiplets L_2M_1 and L_2M_2 ($i=1$ to 5) have been calculated for $Z=35$ to 50 using the Auger electron energy values tabulated recently by Larkins (1977). It is found that whatever may be the spectator vacancy, the satellite pair formed as a result of the transitions

L_2M_1 , $L_2 \rightarrow Y$ and L_3M_1 , $L_3 \rightarrow Y$ where Y is a lower common level, will follow the characteristics of spin doublets in X-ray diagram lines. It is concluded that the occurrence of the so called spin doublets in X-ray satellites is a direct consequence of the fact that the parental one-hole doublet behavior persists even in atoms which have two holes in their inner shells. (9 refs.)

60640 Calculation of X-ray line energies of molybdenum in the transient state by Slater's method. S.G.Gagarin, I.G.Falkov. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.94-5 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.160-2 (July 1982). [Received: April 1983]

It is shown that the transient state principle introduced by Slater may be applied to calculation of X-ray transition energies in the framework of the Hartree-Fock-Dirac-Slater (HFDS) method. In the case of molybdenum, the error in the description of the L lines is 2%, and of the K lines 0.2%. For calculation of the latter with $z \geq 40$ it is necessary to take into account relativistic corrections to the exchange part of the potential. (17 refs.)

32.50 FLUORESCENCE, PHOSPHORESCENCE

(inc. quenching)

60641 Intensity correlations in resonance fluorescence from coupled two-level atoms. M.Wiegand (Theoretische Festkörperphys., Tech. Hochschule Darmstadt, Darmstadt, Germany). *J. Phys. B (GB)*, vol.16, no.7, p.1133-58 (14 April 1983).

The normalised intensity correlation function of resonance fluorescence radiation from two-level atoms is studied in various respects. In the first part of the paper the author discusses only interference effects for several uncoupled, linearly arranged, atoms. It is shown that, depending on the distance between the atoms, the direction of observation and the strength of the driving field, an antibunching effect as well as a very big bunching effect may be observed. In the second part of the paper he studies for the case of two atoms and weak external fields the influence of the interaction between the atoms by means of a perturbation theory. It is shown that the coupling between the atoms strongly modifies the normalised intensity correlation function in comparison with the case of uncoupled atoms. He takes as the driving field a coherent external field as well as laser light and thermal light. (34 refs.)

60642 Delay in the spontaneous decay of excited atoms in a resonator. I.V.Sokolov. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.5-6 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.9-11 (July 1982). [received: April 1983]

The possibility is pointed out of controlling the rate of spontaneous emission in an interferometer with closely spaced plane-parallel mirrors (a Fabry-Perot interferometer). From the results it can be seen that scanning the thickness of the interferometer around the value $l=\lambda/2$ will change the average radiation constant by a factor of 3 and lead to a complete arrest of the decay for certain sublevels. For an experimental demonstration of this arrest of spontaneous decay, it is important to note that the resonator discussed requires collimation of the atomic beam along only a single coordinate. In contrast with a tubular waveguide, the thickness of the gap in this case can be scanned around the critical value to distinguish the delay in the spontaneous decay from other effects (e.g. the quenching of atoms at the walls). (4 refs.)

60643 Measurement system for temporal response of atomic and molecular systems using the correlation method with pseudorandomly modulated laser light. H.Baba, K.Sakurai (Dept. of Pure & Appl. Sci., Univ. of Tokyo, Tokyo, Japan), F.Shimizu. *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.454-7 (April 1983).

A system to measure the temporal behavior of atomic or molecular fluorescence, which is disturbed by large noise background, has been developed. This system uses the pseudorandom modulation technique of length up to 1023, temporal resolution of approximately 83 ns, and a photon counting capacity of 10^7 counts/s. Data processing by a minicomputer and a hardware demodulation circuit enable quick analysis of a large volume of data. The signal-to-noise ratio of this measurement system is discussed with some experimental comparisons. The system is tested in the decay time measurement of I_2 fluorescence. (10 refs.)

60644 Intense emission from an Ar:Xe mixture pumped by a microsecond electron beam. Yu.I.Bychkov, V.F.Losev, V.F.Tarasenko, E.N.Tel'minov (Inst. of High-Current Electronics, Acad. of Sci., Tomsk, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.361-3 (July 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.837-40 (July 1982). [received: April 1983]

The authors have achieved efficient emission in the near-IR part of the spectrum from atomic transitions of xenon by pumping an Ar:Xe mixture with a microsecond electron beam. The specific output energy was 2.3 J/liter; the efficiency was $\sim 1\%$ in terms of the energy pumped in by the electron beam; and the total output energy was 7 J. (4 refs.)

32.60 ZEEMAN AND STARK EFFECTS

60645 Gauge invariant derivation of the AC Stark shift. D.H.Kobe (Dept. of Phys., North Texas State Univ., Denton, TX, USA). *J. Phys. B (GB)*, vol.16, no.7, p.1159-69 (14 April 1983).

The time-dependent AC Stark shift for an atom in a classical electromagnetic field is derived in a manifestly gauge invariant way. In the electric dipole approximation (EDA) the time-dependent AC Stark shift is obtained in second order both from the gauge invariant formula and from the conventional approach. The conventional approach uses the unperturbed Hamiltonian H_0 with an interaction $A \cdot p$ plus A^2 (constants omitted). In the EDA the gauge invariant approach simplifies in a gauge in which the energy operator reduces to H_0 and the interaction is proportional to $E \cdot r$. The time-dependent AC Stark shifts calculated by the two methods are different. In the static limit the gauge invariant energy gives the correct shift, while the energy calculated from the conventional interaction does not. When the energies are averaged over all times the same average AC Stark shifts are obtained. (39 refs.)

60646 Fine-structure parameters of the helium 1s3d configuration from the experimental crossing positions of Zeeman sublevels. G.P.Anisimova, R.I.Semenov. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.10-13 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.17-22 (July 1982). [received: April 1983]

Experimental data on the crossing fields are used to calculate the fine-structure energy intervals in a zero magnetic field, the parameters of the fine structure, the gyromagnetic ratios, and the singlet-triplet mixing ratio for the 1s3d He I configuration in the single-configuration approximation. The magnetic-field intervals for all other crossings of magnetic sublevels in the 0-300-Oe interval that have not yet been observed experimentally are calculated; the errors in the measurements of the crossing fields and the parameter of the electrostatic exchange interaction are taken into account. If the parameters are to be refined and these intervals narrowed, it will be necessary to carry out more accurate measurements of the parameter of the electrostatic exchange interaction. (11 refs.)

60647 Magnetic-sublevel shifts of potassium atoms in a constant magnetic field and in the electric fields of laser beams of various polarizations. T.Ya.Karagodova, A.I.Karagodov. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.123-5 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.206-10 (Aug. 1982). [received: April 1983]

The shifts of the magnetic sublevels of potassium atoms that result from the interaction of these atoms with a constant magnetic field and with the electric field of a laser beam are calculated for an arbitrary relationship between the fine-structure interval and the Zeeman and Stark shifts. The cases of linear and circular polarization of the laser beam are considered. The results are compared with the experimental data available. (3 refs.)

32.70 SPECTRAL LINE SHAPES AND INTENSITIES

60648 Arc measurements of Fe II transition probabilities. J.Moity (Obs. de Meudon, Meudon, France). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.37-62 (April 1983).

Relative oscillator strengths for 494 Fe II lines in the wavelength range 2550-5300 Å were experimentally determined by use of a wall-stabilized arc operated in argon with a small admixture of iron carbonyl. Plasma temperature and electron density were about 9000K and $4.75 \times 10^{15} \text{ cm}^{-3}$ respectively. The relative gf-values are brought onto an absolute scale by use of the Saha equation and by comparing the intensity of a given Fe II line with those of neighbouring Fe I lines that are known rather precisely (Fuhr et al., 1981). The results are compared with available literature data. All other previous experiments and calculations show scale shifts. After corrections of these shifts the scatters are generally low, except with the semi-empirical calculations of Kurucz and Peytremann (1975). From those literature data the authors derive additional Fe II gf-values that are adjusted onto their scale, thus extending the wavelength range on both sides to 2030-7700 Å. (53 refs.)

60649 Lifetime ratios for Ar I 4p levels. K.Musiol, D.W.Jones, W.L.Wiese (Atomic & Plasma Radiation Div., NBS, Washington, DC, USA).

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.4, p.321-7 (April 1983).

Relative transition probabilities of 13 transitions between the $3p^4s$ and $3p^4p$ configurations in Ar I have been measured in emission with a wall-stabilized arc. These data have been combined to yield relative lifetimes which are compared with recent direct lifetime measurements. An important consideration in the authors' experiment was to minimize effects of radiation imprisonment since this effect may have played an important role in lifetime measurements by other methods. Their results agree well with most previously published lifetime data and emission measurements. (16 refs.)

60650 Transition probabilities for Ne I lines. A.Magazzu, V.Pirronello, G.Strazzulla (Osservatorio Astrofisico, Catania, Italy).

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.4, p.375-8 (April 1983).

Calculated transition probabilities for about 140 lines of Ne I are presented. The general agreement the authors have found with other existing data, for those values for which comparisons were carried out, verifies the reliability of their calculations and gives them confidence in these values for applications in astrophysics and plasma physics. (13 refs.)

60651 Z dependence of the probabilities for 3-3 and 2-2 transitions for excited states in the isoelectronic sequence of Ne. A.K.Pokleba, U.I.Safro-nova.

Opt. & Spectrosc. (USA), vol.53, no.1, p.7-9 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.12-16 (July 1982). [received: April 1983]

The Z dependence of the probabilities for 2-2 transitions ($2s2p^63l-2s^22p^53l$) and 3-3 transitions ($2s2p^63d-2s2p^63p-2s2p^63s$, $2s^22p^63d-2s^22p^63p-2s^22p^63s$) has been studied. Calculations were carried out in an intermediate coupling model on the basis of a perturbation theory using $1/Z$ as a small parameter. (16 refs.)

60652 Properties of nonlinear three-level resonances with arbitrary ratio between homogeneous and inhomogeneous transition widths. O.G.Bykova, V.V.Lebedeva, N.G.Bykova, A.V.Petukhov.

Opt. & Spectrosc. (USA), vol.53, no.1, p.101-3 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.171-4 (July 1982). [received: April 1983]

The physical bases of structure formation in the Doppler-broadened contour of a transition in the presence of a strong monochromatic field in an adjacent transition are in their general features well known. However, a detailed analysis of the structure has been conducted only in the approximation $kV \gg \Gamma$ (the Doppler limit). In this approximation in the limiting cases of strong and weak saturation, analytical expressions for the form of the spectrum have been obtained. The authors present a correct account of the influence of the Doppler width of a transition on the character of nonlinear resonances. A three-level scheme of the bent type serves as the object of investigation. However, the regularities peculiar to it also occur for other three-level schemes. (7 refs.)

60653 Regularities in the radiative lifetimes of excited states of the hydrogen atom. Ya.F.Verolainen.

Opt. & Spectrosc. (USA), vol.53, no.2, p.200-2 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.342-5 (Aug. 1982). [received: April 1983]

Using all the data on the experimental and theoretical determination of radiative lifetimes of the excited states for the hydrogen atom that are found in the literature, the author has constructed graphical dependences of the lifetimes on the principal quantum number for all series and analyzed their behavior by a least-squares method with the aim of determining the constant of the exponential dependence. (17 refs.)

60654 Lifetimes of $ns(3/2)$ ($n=6, 7, 8, 9$) levels and transition probabilities of $4p$ - ns lines of Ar I. M.J.G.Borge, J.Campos (Catedra de Fisica Atomica Experimental, Facultad de Ciencias Fisicas, Madrid, Spain).

Phys. Rev. A (USA), vol.27, no.4, p.1910-13 (April 1983).

Forty-eight transition probabilities for lines belonging to the $4p$ - ns ($n=6, 7, 8, 9$) transition arrays of Ar I have been determined by means of emission-line-intensity measurements. The single-photon delayed-coincidence method has been used to obtain the lifetime values of the $ns(3/2)$ ($n=6, 7, 8, 9$) levels. With the taking into account of these lifetimes together with theoretical calculation in jK coupling for the lines beyond the experimental range, the relative transition probabilities were put on an absolute scale. The lifetime values obtained in the present work are original in the literature excepting the $7s(3/2)$ -level lifetime. Four transition probabilities are also the first values found in the literature. (14 refs.)

60655 Inhomogeneous light shift in alkali-metal atoms. J.C.Camparo, R.P.Frueholz, C.H.Volk (Chem. & Phys. Lab., Aerospace Corp., Los Angeles, CA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.1914-24 (April 1983).

The dynamic Stark shift of an inhomogeneously broadened spectral transition has been studied. The authors' measurements show a shift in the observed ^{87}Rb ground-state hyperfine transition which has a nonlinear dependence on light intensity when the conditions for inhomogeneous broadening are met. The nonlinearity is the result of light-intensity gradients in the signal volume, which produce an inhomogeneously broadened asymmetric microwave transition. They show that their measurements are in full agreement with the second-order perturbation-theory treatment of light-induced energy-level shifts, when the effects of inhomogeneities are properly taken into consideration. The effects of inhomogeneous broadening must be carefully considered when extracting oscillator strengths from light-shift data, or when performing high-precision laser spectroscopy. (21 refs.)

60656 Technique for Lamb-shift measurements on high-Z ions produced by a hot plasma. R.J.Knize (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2258-60 (April 1983).

A new technique is proposed for the measurement of high-Z Lamb shifts using ions created by a hot Tokamak plasma. By using the laser resonance technique to measure the $2S_{1/2}-2P_{1/2}$ or $3/2$ energy splittings, it is possible to obtain a fractional accuracy of 10^{-10} . This would be a considerable improvement on existing measurements and would allow a clear test of current calculations. (16 refs.)

60657 Specific mass shift in the $1s2s^3S$ and $1s5p^3P$ states of helium. L.A.Bloomfield, H.Gerhardt, T.W.Hansch (Dept. of Phys., Stanford Univ., Stanford, CA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2261-4 (April 1983).

The authors report the first measurement of the specific mass shift of the 5^3P level between ^4He and ^3He . A value $\Delta\mu_s = -113.1 \pm 5.0$ MHz, twenty times more accurate than the best known theoretical value, was obtained by ultraviolet-infrared double-resonance laser spectroscopy of the $2^3S-5^3P-13^1S$ Δ transition. (13 refs.)

60658 Low pressure shift of the $2p^3p^2-2p^25s$ spectral lines of neon perturbed by neon and helium. A.Bielski, R.Bobkowski, R.Dygda, J.Wawrzynski (Inst. of Phys., Nicholas Copernicus Univ., Torun, Poland).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.261-5 (Jan. 1983).

The shift of five spectral lines arising from the $2p^3p^2-2p^25s$ transitions of neon and emitted from a low-pressure glow discharge in pure neon and neon-helium mixture have been measured. The values of the pressure shift coefficients were determined. The results are interpreted in terms of the impact theory assuming a Lennard-Jones potential. Results obtained in this work indicate that the Lennard-Jones potential cannot describe adequately the shift of most spectral lines corresponding to the $2p^3p^2-2p^25s$ transitions. (14 refs.)

60659 Determination of the absolute intensity of the afterglow in flash photolysis of tellurium vapor. A.P.Ubelis, A.E.Lezdin' (P. Stuchka State Univ., Riga, Latvian SSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1364-5 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2097-9 (Oct. 1982). [received: April 1983]

An investigation was made of the spectral distribution of the absolute intensity of the afterglow of tellurium vapor. Measurements were made using a

high-temperature flash photolysis system at a tellurium vapor pressure of 0.23 Torr, a xenon pressure of 20 Torr, and a cell temperature of 950K. The afterglow was attributed to the photorecombination of tellurium atoms in the ground state $^3P_{0,1,2}$. An estimate was obtained of the lower limit of the photorecombination coefficient which was found to be $2.65 \times 10^{-16} \text{ cm}^3 \cdot \text{molecule}^{-1} \cdot \text{sec}^{-1}$. 60660 Resonance light pressure in the field of partially coherent laser radiation. V.G.Minogin.

Opt. & Spectrosc. (USA), vol.53, no.1, p.73-6 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.125-9 (July 1982). [received: April 1983]

A kinetic Fokker-Planck-type equation is derived for the distribution function of atoms moving in a resonance light field with a fluctuating frequency. It is shown that the stochastic nature of the light field leads to a simplification of the light-pressure force and of the momentum diffusion tensor. (12 refs.)

60661 Local velocity distribution of atoms in a light wave in resonance with an atomic transition. V.G.Minogin.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1173-5 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1905-9 (Oct. 1982). [received: April 1983]

The velocity distribution of atoms moving in a plane light wave in resonance with an optical atomic transition is determined. The Fokker-Planck equation for the atomic distribution function is written out to third-order terms, inclusive. It is shown by analyzing the functional form of the equation that in the spatially uniform case, the asymptotic atomic velocity distribution is determined by terms through order two in the Fokker-Planck equation; the terms of order three and higher give small corrections to the macroscopic moments and to the velocity distribution. It is concluded that only terms up to second order need to be considered for accurate calculation of the local atomic velocity distribution using the infinite system of Fokker-Planck equations. 32.80B Level crossing and optical pumping

60662 Optical pumping of stripped relativistic ions. G.C.Baldwin, N.J.DiGiacomo (Los Alamos Nat. Lab., Los Alamos, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.981-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Selected states of ions in the sodium-like isoelectronic sequence (P through Ca) in a beam accelerated to relativistic energies can be excited by a beam of optical laser radiation that intersects their trajectory at an appropriate angle. Pumping rates can be estimated, assuming the line broadening mechanism to be Doppler and available laser intensities. The authors find that it is possible to generate population inversions between the $3^2D_{3/2}$ states and the $3^2P_{3/2}$ states of those ions by selectively exciting the $4^2P_{1/2}$ state. To a fixed observer, the radiation from transitions between those states will be Doppler-upshifted into the X-ray region and will be tunable. Moreover, given sufficiently high ion density and a low beam emittance, and assuming that backward emission can be suppressed by means of a traveling-wave pumping system, moderate gain by stimulated emission along the ion column may be achieved. (5 refs.)

60663 ^{235}U isotope enrichment in the metastable levels of U I. J.M.Gagne, Y.Demers, C.Dreze, P.Pianarosa (Dept. de Genie Phys., Ecole Polytech., Montreal, Canada).

J. Opt. Soc. Am. (USA), vol.73, no.4, p.498-9 (April 1983).

The authors have used optical pumping to produce a substantial ^{235}U enrichment in the metastable levels of U I in the discharge afterglow of a hollow-cathode vapor generator. The measured isotope-enrichment factor for the level at 3800 cm^{-1} is approximately 20. (7 refs.)

60664 Kinetics of the plasma decay in lithium vapor; population inversion for the $3p$ - $3s$ transition. L.V.Voronyuk, V.A.Kvitsinskii, V.I.Lukashenko, G.V.Pitatev.

Opt. & Spectrosc. (USA), vol.53, no.1, p.18-22 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.33-9 (July 1982). [received: April 1983]

The kinetics of the plasma decay and the formation of a population inversion between the $3p$ and $3s$ levels have been studied in a lithium-helium mixture at a helium pressure of 40 Torr and at a lithium vapor density of $7 \times 10^{13} \text{ cm}^{-3}$. Regardless of the discharge conditions, an inversion occurs if the density of the cooled electrons is below $2 \times 10^{12} \text{ cm}^{-3}$ because of the different radiative lifetimes of the $3p$ and $3s$ levels. The cross section for electron-

impact $3p\text{-}3s$ deexcitation transitions has been determined. The gain at the $2.69\text{-}\mu\text{m}$ wavelength is estimated. (16 refs.)

60665 Nuclear polarisation of helium 3 by a colour centre laser. M.Leduc (Lab. de Spectroscopie Herzienne, ENS, Paris, France). *Rev. Cethedec (France)*, vol.19, no.NS82-2, p.3-14 (1982). In French. A colour centre laser using $(F_2)^+$ centres in NaF was developed for the near infrared. The long time stability of the laser crystals was improved and good conditions for the single frequency operation of this laser were found. Such an apparatus allowed large nuclear polarisation of a ^3He vapour by optical pumping. (20 refs.)

60666 Dependence of the total concentration of optically oriented atoms on the radius of the pump beam. M.B.Gornyi, B.G.Matsov (M.I. Kalinin Polytech. Inst., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.372-3 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.859-62 (July 1982). [received: April 1983]

The spatial distribution of the optically oriented atoms in the gas-filled cells in various quantum-electronics devices is described by the optical-pumping equation. The authors use an analytical solution of this equation to predict a possible substantial increase in the total number of oriented atoms in the cell, achieved by decreasing (to an optimum value) the radius B of the pump beam in comparison with the cell radius A . The idea is to reduce the effect of relaxation at the wall as a result of the appearance of a diffusion layer around the light beam. (3 refs.)

Fine-structure parameters of the helium $1s3d$ configuration from the experimental crossing positions of Zeeman sublevels See Entry 60646

32.80D Autoionization

60667 Interaction between two Rydberg series of autoionizing levels in barium. F.Gounand, T.F.Gallagher, W.Sandner, K.A.Safina, R.Kachru (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.1925-38 (April 1983).

Using a three-step laser excitation approach, the authors have studied the autoionizing $(6p_{1/2})_{1-3}$ states of neutral barium. The $6p_{1/2}$ series is essentially unperturbed and exhibits a constant quantum defect and autoionization widths which scale as v^{-3} , where v is the effective quantum number. The $6p_{1/2}$ states are narrower than the $6p_{3/2}$ states and are perturbed by their interaction with the $6p_{3/2}$ states. The perturbation leads to variations in the quantum defects of the $6p_{1/2}$ states and departures from the v^{-3} scaling of the widths. The interaction is most apparent in the excitation of the $6p_{1/2}10d$ state which is degenerate with the $6p_{1/2}$ states for $n=20$. The observed excitation spectrum clearly shows the influence of the degenerate $6p_{1/2}nd$ states and is shown to represent the spectral density of the $6p_{3/2}10d$ state. This spectrum as well as all the above-mentioned observations may be connected by a quantum-defect treatment. (22 refs.)

60668 Photoexcitation of an autoionizing resonance in the presence of off-diagonal relaxation. K.Rzazewski, J.H.Eberly (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.2026-42 (April 1983). The authors discuss the theory of photoexcitation of an autoionizing resonance. They solve a set of coupled stochastic integrodifferential equations which are based on the Fano model for autoionization, but which include the effects of weak elastic collisions, weak or strong laser excitation, and finite laser bandwidth. They determine the exact photoelectron spectrum and give formulas for spectral peak positions and widths. Redistributive scattering is evident, as are various effects normally associated only with transitions between discrete levels. Under certain conditions symmetries and fixed points of the electron spectrum can be predicted. (24 refs.)

Population of the three major exit channels in the $3d$ resonance region of atomic gallium See Entry 60622

32.80F Photoionization and photodetachment

60669 Theoretical cross sections for nonresonant five-photon ionisation of sodium. S.N.Dixit (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA). *J. Phys. B (GB)*, vol.16, no.7, p.1205-9 (14 April 1983).

Truncated summation results for the differential cross sections for nonresonant five-photon ionisation of sodium are presented. The agreement between the recently measured total cross section and calculated one is fair while the photoelectron angular distributions differ considerably in the two cases. (10 refs.)

60670 Molecular beam study of photoionization of uranium and uranium oxide. R.Talukdar, A.Tripathy, P.N.Bajaj, P.K.Chakraborti, G.D.Saksena (Spectroscopy Group, Bhabha Atomic Res. Centre, Trombay, Bombay, India). *Opt. Commun. (Netherlands)*, vol.45, no.3, p.179-82 (1 April 1983). Crossed laser molecular beam configuration was used to study the photoionization of U and UO by the UV-lines of an argon ion laser. Photoionization efficiencies of both U and UO were found to be line sensitive. Photoionization by the 3638 Å line was observed for the first time. Uranium atom ionization efficiency being higher for the 3345 Å and 3511 Å groups of lines, while UO ionization efficiency being maximum for the 3638 Å line. Dependence of photoion signal on laser power and relative photoionization efficiencies of the two isotopic species of uranium are also investigated. (12 refs.)

60671 Effect of atomic polarization on two-photon electron detachment from the corresponding negative ions. P.A.Golovinskiy, B.A.Zon. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.125-8 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.211-16 (Aug. 1982). [received: April 1983]

The polarization of the atoms is incorporated in an analysis of the two-photon detachment of electrons from negative ions. The probabilities for electron detachment from negative ions of alkali elements by linearly and circularly polarized light are calculated. (9 refs.)

60672 Calculation of photoionization cross sections for lithium isoelectronic series ions by the Dirac-Fock method. V.A.Zilitis. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.204-5 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.348-51 (Aug. 1982). [received: April 1983]

Studies the photoionization of lithium-like ions from S^{13+} to Yb^{67+} on the basis of the relativistic self-consistent-field method with a correct account of exchange. (13 refs.)

60673 Microwave ionization of Na Rydberg levels. P.Pillet, W.W.Smith, R.Kachru, N.H.Tran, T.F.Gallagher (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).

Phys. Rev. Lett. (USA), vol.50, no.14, p.1042-5 (4 April 1983). The authors have observed the ionization of Na Rydberg states by strong microwave fields and have found that the field required for ionization is $1/(3.7n^2)$ (in atomic units) for $n=20\text{-}37$. This field is close to the field $1/(3n^2)$ at which the Stark manifolds of principal quantum numbers n and $n+1$ intersect. The ionization can be shown to arise from transitions occurring near these intersections. (14 refs.)

60674 Angular distribution of Xe $5s\text{-}4p$ photoelectrons: disagreement between experiment and theory. A.Fahlan, T.A.Carlson, M.O.Krause (Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.15, p.1114-17 (11 April 1983).

The angular asymmetry parameter β for the Xe $5s\text{-}4p$ photoelectrons has been studied with use of synchrotron radiation ($h\nu=28\text{-}65\text{ eV}$). The present results show that the relativistic random-phase approximation theory does not satisfactorily describe the Xe $5s$ photoionization process close to the Cooper minimum and thus require a renewed theoretical approach. The $5s$ partial photoionization cross section was obtained over the same photon region and the results agree with experimental values found in the literature. (19 refs.)

60675 Photoionization cross section of neutral calcium including double electron resonances. Z.Altun, S.L.Carter, H.P.Kelly (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.1943-57 (April 1983).

Many-body perturbation theory has been used to calculate the photoionization cross section of neutral calcium from threshold at 6.11 to 70 eV . Near-threshold resonance structure due to double electron excitation has been included and is compared with the results of several experiments. At higher energy, resonance structure due to $3p$ excitations to bound states with $l=0$ and 2 has also been calculated and compared with a measurement by Mansfield and Newsom (1977). The $3p^24s^23d^1P$ resonance is found to be particularly prominent, in agreement with experiment. The authors' results are also compared with a recent calculation using the relativistic random-phase approximation. (45 refs.)

60676 Photoelectron spectrum from laser-induced autoionization in the presence of spontaneous emission and off-diagonal relaxation. G.S.Agarwal (School of Phys., Univ. of Hyderabad, Hyderabad, India), D.Agassi. *Phys. Rev. A (USA)*, vol.27, no.4, p.2254-7 (April 1983).

The exact solution of the Fano model, including both radiative recombination to the initial state (recycling) and off-diagonal phase-jitter relaxation, is obtained by two different methods. The authors derive a simple substitution rule stating that, by replacing $\pm i\omega_l \rightarrow \pm i\omega_l + \gamma_l$, the phase-jitter effects are included. The time dependence of the solution has a convolution form. The results for the electron spectrum exhibit an increasing elastic-peak line narrowing the faster the spontaneous decay becomes. For very fast spontaneous decay, the elastic linewidth saturates to γ_l . The relevant thresholds are discussed and demonstrated. (10 refs.)

60677 Multiple photoionization of isotropic atoms. T.Arisawa, Y.Maru-yama, Y.Suzuki, K.Shiba (JAERI, Naka-gun, Ibaraki-ken, Japan). *Physica B & C (Netherlands)*, vol.115 B+C, no.2, p.266-70 (Jan. 1983).

Three-photon ionization spectroscopy was applied in the visible wavelength region using a Nd:YAG laser-pumped dye laser having a line width of 1.1 GHz . It is observed that the ionization peaks are broadened and the isotopic peaks cannot be resolved in the higher power density region. (14 refs.)

60678 Direct measurement of K-shell photoionization cross sections by means of the coincidence method. C.Ranganathaiah, B.Sanjeeviah (Dept. of Phys., Univ. of Mysore, Mysore, India).

Physica B & C (Netherlands), vol.115 B+C, no.3, p.411-14 (March 1983). The coincidence method developed by authors for the measurement of K-shell photoionization cross sections for photon energies above 500 keV (see C. Ranganath et al., *Nucl. Instrum. and Methods*, vol.154, p.331, 1978) has been used at a lower photon energy to check the accuracy of the method in comparison with the other methods described in the literature. K-shell photoionization cross sections in tin, gold, lead and thorium targets for ^{51}Cr gamma rays have been measured. The results are compared with other measurements and with theoretical data. Good agreement is observed between the theoretical cross sections and the present experimental ones. (15 refs.)

60679 Spatial diagnostics of a gallium atomic beam by the method of two-stage laser photoionization. A.T.Tursunov, N.B.Eshkabilov (Alisher Navoi State Univ., Samarkand, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1363-4 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2096-7 (Oct. 1982). [received: April 1983]

An experimental investigation was made of the spatial structure of a gallium atomic beam of the method of two-stage laser photoionization. The width of an atomic beam at various distances from the source was determined. (4 refs.)

32.80K Multiphoton processes

60680 Real-time multiphoton ionization detection of iodine atoms produced by infrared multiphoton dissociation of perfluoroalkyl iodides. P.A.Hackett, P.John, M.Mayhew, D.M.Rayner (Div. of Chem., Nat. Res. Council, Ottawa, Ontario, Canada).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.139-42 (1 April 1983). The authors report the direct detection of iodine atoms following infrared multiphoton dissociation of perfluoroalkyl iodides. The technique, three-photon resonant two-photon ionization, shows great promise as an actinometer for primary dissociation yield in IRMPD. (18 refs.)

60681 Investigation of atomic relaxation by the three-level echoes. A.I.Alekseev, A.M.Basharov (Engng. Phys. Inst., Moscow, USSR). *Opt. Commun. (Netherlands)*, vol.45, no.3, p.171-8 (1 April 1983).

A method for identification of two-photon (optically forbidden) transitions and determination of all their relaxation parameters due to depolarizing atomic collisions was developed on the basis of studying polarization properties and decay laws of the three-level echoes. (13 refs.)

60682 Multiphoton interactions. G.R.Bennett.

Univ. Wales, Swansea thesis, Sept. 1982

This dissertation presents an account of some of the many types of interaction which take place in gases and metal vapours and at solid surfaces illuminated by very powerful flashes of laser radiation. Typically the laser beam intensities are $\geq 10^{11}$ W cm⁻² and at such high values the interactions involve the 'simultaneous' absorption of several photons. This is in contrast to the usual single photon interactions such as photoionisation and photoelectric emission which occur commonly in electrical discharges in gases. The processes of multiphoton absorption and ionisation are examined theoretically and experimental results for a wide range of photon energies and fluxes illuminating a wide variety of gases, metal vapours and solids are presented. A new simple analytical procedure is developed which enables the multiphoton ionisation rate for hydrogen to be computed. This gives results which are in agreement with those obtained from a more complicated quantum mechanical treatment. Applications of multiphoton absorption processes in spectroscopy, detection of trace quantities (single atom) and isotope separation are described.

32.90 OTHER TOPICS IN ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS

60683 Spontaneous emission without field quantization. R.J.Cook (Dept. of Phys., Air Force Inst. of Technol., Wright Patterson Air Force Base, Dayton, OH, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.2265-7 (April 1983).

A theory of spontaneous emission is presented which does not quantize the radiation field. By allowing the atomic electron's radiation-reaction field to act in the equation of motion for the atomic density operator, the theory accounts for spontaneous emission without leaving the Hilbert space of the atom. The theory is quite simple and leads to exactly the same relaxation terms in the density-operator equation of motion as those predicted by the quantum theory of radiation. (11 refs.)

33.00 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS

33.10 CALCULATION OF MOLECULAR SPECTRA

60684 Infrared dephasing of degenerate fundamentals: the ν_6 mode of liquid CD₃I. W.G.Rothschild, J.Sousen-Jacob, J.Vincent-Geisse (Lab. de Recherches Phys., Univ. Pierre et Marie Curie, Paris, France). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.43-6 (25 March 1983).

A model of vibrational dephasing with motional narrowing by the librational motions of the molecules in their cages is tested on the example of the ν_6 degenerate infrared fundamental of liquid CD₃I at room temperature. (14 refs.)

60685 A model for the pseudorotation of cycloheptane. V.Elsner (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), H.L.Strauss. *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.276-8 (8 April 1983).

A very simple model for a seven-membered ring having fixed bond lengths and fixed ring bond angles is presented. The model pseudorotates in both the twist-chair/chair and the twist-boat/boat conformations and gives reasonably accurate detailed geometries. (4 refs.)

60686 Chaotic motions in vibrating molecules: the generalized Henon-Heiles model. R.Ramaswamy (Tata Inst. of Fundamental Res., Bombay, India). *Chem. Phys. (Netherlands)*, vol.76, no.1, p.15-24 (1 April 1983).

The method of avoided crossings is applied to a simple molecular model, the generalized Henon-Heiles system of coupled oscillators. The aim is to determine the onset of widespread chaotic motions. The method is used to locate, in a simple manner, the resonances that lead to chaotic motions for different choices of parameters, wherein the frequencies of the unperturbed oscillators are in the ratio 3:4 and 7:13. The accuracy of the prediction is verified against numerical calculations of classical trajectories. (36 refs.)

60687 Spectroscopic properties and relaxation processes of impurity molecules in solids. I. Rotational spectra. H.Kono, S.H.Lin (Dept. of Chem., Arizona State Univ., Tempe, AZ, USA).

The spectroscopic properties and relaxation processes of impurity diatomic molecules are studied theoretically. In order to treat the eigenvalue problem and the relaxation process consistently, the authors propose a unified theory based on the adiabatic approximation for the system of a diatomic molecule in monoatomic crystal. The adiabatic approximation is used to separate the total number of degrees of freedom of the system into the intramolecular vibrational, rotational, and lattice vibrational degrees of freedom. In this paper, the authors report the calculation of the rotational level shifts for HCl in rare gas matrices, using the M5 potential proposed by Hutson and Howard (1982). The effect of lattice vibration is appropriately taken into consideration by means of the Green's function method for point defects developed by Maradudin et al. (1971). The agreement between the theory and experimental results is good. It is shown that the coupling between the molecular rotation and lattice vibration is important, which improves the idea of the cell model in which the effect of host atoms is completely neglected. (38 refs.)

60688 Classical and quantum dynamics of long lived doubly excited vibrational states of triatomic molecules. R.M.Hedges, Jr., W.P.Reinhardt (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3964-75 (15 March 1983).

Local mode A-B-A triatomic molecules are modeled as coupled Morse oscillators using classical and quantum techniques. Classical studies indicate large volumes of nondissociating classical phase space, even well above the dissociation threshold. The trapped classical motion corresponds to excitation in both bond modes of the system. Quantum studies have been performed as a function of coupling constant (mass ratio) and of dissociation energy. Quantum doubly excited vibrational resonances are found with lifetimes of up to 10^6 vibrational periods. The lifetimes of the states, as \hbar (or dissociation energy) is varied, are in accordance with the correspondence principle. Substantial deviation from the predictions of statistical theories is noted in the distributions of lifetimes, as well as in the fact that all of the resonances are only weakly coupled 'direct' dissociation channels. (52 refs.)

60689 On the onset of strong mode coupling in small polyatomic molecules. R.S.Berry (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3976-80 (15 March 1983).

The number of vibrational states corresponding to separable, quasiperiodic motion of low dimensionality is estimated by a generalization of the analysis of the quantum-mechanical Henon-Heiles problem by Hose and Taylor (1982). The number of nonseparable states with strongly coupled modes appears to overwhelm the number of separable 'quasiperiodic' states whenever the molecule in question contains five or more vibrational quanta, and may dominate for states with four or even three vibrational quanta. Some comments are made to try to clarify the concepts of separability and quasiperiodicity. (15 refs.)

60690 Local modes and cross-correlation functions. J.T.Muckerman (Chem. Dept., Brookhaven Nat. Lab., Upton, NY, USA), D.W.Noid, M.S.Child.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3981-9 (15 March 1983).

It is shown how the use of cross-correlation functions and their Fourier transform provides a convenient probe of the division of the classical phase space for stretching vibrations of H₂O into local, normal, stochastic fractions. Resulting classical estimates for the numbers of total and local states, $N(E)$ and $N_l(E)$, respectively, as functions of energy are in excellent agreement with previous quantal and semiclassical results. The classical estimate of the number of stochastic states $N_s(E)$ as a function of energy is a new result. The present method is readily generalizable to polyatomic molecules with many vibrational degrees of freedom. (19 refs.)

60691 Local modes: their relaxation, polarization, and stereoselective excitation by lasers. J.W.Perry, A.H.Zewail (Arthur Amos Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA).

J. Phys. Chem. (USA), vol.86, no.26, p.5197-205 (23 Dec. 1982).

Results are presented concerning the nature and relaxation of methyl and aromatic CH stretching overtones of low-temperature crystalline durene (1,2,4,5-tetramethylbenzene). The experimental polarization ratios of the bands are used to compare three limiting models (local modes, independent methyl modes, and fully delocalized modes) in the light of new information on the conformation of durene obtained by low-temperature X-ray diffraction. A picture is provided for the origin of the splittings observed for the $\Delta\nu_{CH}=5$ spectra at 1.7K and the nature of the vibrational energy distribution of the single-photon excited states of the methyl and aromatic subsets. (39 refs.)

60692 High-lying levels of ozone via an algebraic approach. I.Benjamin, R.D.Levine, J.L.Kinsey (Fritz Haber Molecular Dynamics Res. Center, Hebrew Univ., Jerusalem Israel).

J. Phys. Chem. (USA), vol.87, no.5, p.727-9 (3 March 1983).

An algebraic Hamiltonian for the vibrational motion in ozone, including a Darling-Dennison type coupling term, used to fit the recently observed high overtones. The good quality of the fit is due to the coupling of anharmonic normal modes by quartic order (Darling-Dennison type) coupling term. The algebraic Hamiltonian contains six parameters and these suffice to provide a better fit than the six-parameter spectroscopic term formula which uses a Darling-Dennison type coupling among harmonic modes. The present results provide a hitherto unexplored quantitative application of the algebraic approach to perturbed high lying states of triatomics. (13 refs.)

60693 Vibrational state of chemisorbed molecule on metal surface. H.Ueba (Dept. of Electronics, Toyama Univ., Toyama, Japan).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.157-62 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The vibrational state of a chemisorbed molecule on a metal surface is studied by focusing attention on the role of electron-hole pair excitations of the coupled molecule-metal system. The vibrational line shapes thus calculated are characterized by both large red shift in the frequency and broad width (short lifetime) compared with those of free molecules. (9 refs.)

60694 Allowance for the dependence of the repulsion branch of the potential of intermolecular interactions on the vibrational coordinates in the description of the displacements of the vibrational frequencies of molecules in a vapor-liquid transition. S.I.Lukyanov, S.Kh.Akopyan.

Opt. & Spectrosc. (USA), vol.53, no.1, p.34-8 (July 1982). Translation of:

Opt. & Spektrosk. (USSR), vol.53, no.1, p.60-6 (July 1982). [received: April 1983]

A method has been proposed for describing the dependence of the repulsion potential on the vibrational coordinates, based on the use of a dumbbell model. The displacement of the principal vibrational band of the nitrogen molecule in the vapor-liquid phase transformation has been calculated with allowance for the difference in the relative changes in the forces of repulsion and attraction on optical excitation of the molecule. (43 refs.)

60695 Theory of absorption and emission of light by molecular systems with multiwell potentials. B.D.Fainberg.

Opt. & Spectrosc. (USA), vol.53, no.1, p.105-7 (July 1982). Translation of:

Opt. & Spektrosk. (USSR), vol.53, no.1, p.176-80 (July 1982). [received: April 1983]

When considering processes of absorption and emission of light by complex molecules experiencing nuclear regrouping by impurity centers in crystals, and by excitons with charge transfer, etc., a situation very often occurs in which the optical transition takes place between states whose adiabatic potentials have two or more minima. The author uses functional integration to develop a method for calculating the Lax moments and the semiclassical electronic-vibrational spectra of systems in which both the ground state a and the excited state b are characterized by multiwell potentials. The effects of other vibrations (multidimensionality of the adiabatic potential) are also taken into account. (10 refs.)

60696 Derivation of the Hamiltonian of a linear molecule. A.Ya.Tsaune. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.134-7 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.228-34 (Aug. 1982). [received: April 1983]

Fundamental questions concerning the derivation of a Hamiltonian are considered. The meaning of the Wilson-Howard conditions is explained, a nonholonomic condition, supplementing the definition of the behavior of a moving system in a linear molecule is introduced, and expressions are obtained for the angular momenta satisfying the usual commutation conditions and the Wilson-Howard conditions. The procedure for constructing a Hamiltonian is demonstrated both in the Wilson-Howard scheme, as well as for direct transition to molecular coordinates and the final expression for the Hamiltonian is given. (17 refs.)

60697 Study of molecules in a rotation-vibration level excited along a supersonic free jet. D.Boscher, D.Goffe, M.Huetz-Aubert, J.P.Martin (Groupe de Recherches Thermiques, CNRS, Chateaufort-Malabry, France), R.Campargue, M.A.Gaveau, J.Rousseau. *Rev. Cehedec (France)*, vol.19, no.NS82-2, p.81-95 (1982). In French. The ro-vibrational populations of CO are measured along supersonic free jets. When the jet is produced by a high enthalpy generator ($P_0=30$ bar, $T_0=1800$ K), the vibrational and rotational degrees of freedom are in Boltzmann equilibrium even if $T_v \gg T_r$. But, when $P_0=50$ torr, the rotation is no more in internal equilibrium and the high J levels are overpopulated. (19 refs.)

60698 Spectroscopic evidence in ϕ CXYZ molecules for the three groups X, Y, Z acting as a whole, whatever the symmetry may be, in their long range interactions with the chromophore. D.Courtois, B.Vidal (Lab. de Spectroscopie de la Reactivite Chimique, Univ. des Sci. et Tech. de Lille, Villeneuve d'Ascq, France). *Spectrosc. Lett. (USA)*, vol.15, no.12, p.983-90 (1982).

Long range interactions, in structures whose type is ϕ CH₂X, between the aromatic chromophore and an auxochrome X, involve a σ, π coupling through the methylene C_α-H bonds. That hyperconjugative effect encountered with the hydrogen atoms linked to C_α and the modulation of their effect by the auxochrome, allow one to understand the spectroscopic behaviour of the secondary transition in many molecular systems. The authors present some spectroscopic results showing that other bonds than C-H on C_α can also transmit interactions with a great efficiency. The experimental work enables one to determine to what extent σ, π coupling is still possible when none of the symmetry conditions, which however seem to be required from the substituent for the coupling, is satisfied. (14 refs.)

60699 On the application of the method of moments to the investigation of molecular structureless electronic spectra. S.Rashev (Inst. of Solid State Phys., Sofia, Bulgaria). *Spectrosc. Lett. (USA)*, vol.15, no.12, p.1009-16 (1982).

The author outlines a procedure which makes possible the determination of the shift of the optically active vibration in the electronic transition from structurally unresolved absorption or emission spectra, which are typical for polyatomic molecules. (10 refs.)

60700 Heterogeneous relaxation of a vibration-excited molecular gas. E.Ya.Kogan, V.N.Malnev. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.374-81 (March 1983). In Russian.

A quantum theory is developed for transitions in the vibrational spectrum of a diatomic symmetric molecule in the process of its interaction with a solid surface. Transition probabilities in vibrational spectra of the molecule and surface are estimated on the basis of model interaction potential. Analysis of experimental data was performed for a symmetric molecule vibration relaxation on a solid surface and comparison was made with predictions. (5 refs.)

60701 The rotational spectrum and molecular properties of the hydrogen cyanide hydrogen bromide complex. E.J.Campbell, A.C.Legon, W.H.Flygare (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3494-500 (15 March 1983). Rotational spectra have been assigned for four isotopic species of a linear hydrogen-bonded complex formed between hydrogen cyanide and hydrogen bromide. The vibrational ground state spectroscopic constants are HC¹³N, H⁷⁹Br: B₀=1396.59577(60) MHz, D₁=1.892(27) kHz, x_{aa}^{Br}=426.4164(103) MHz, x_{aa}^N=-4.026(11) MHz. HC¹⁴N, H⁸¹Br: B₀=1388.05125(45) MHz, D₁=1.877(19) kHz, x_{aa}^{Br}=356.2316(85) MHz, x_{aa}^N=-4.016(9) MHz. HC¹⁵N, H⁷⁹Br: B₀=1372.50545(25) MHz, x_{aa}^N=1.865(6) kHz, x_{aa}^{Br}=426.6234(61) MHz, C_B=2.51(39) kHz. HC¹⁵N, H⁸¹Br: B₀=1363.88746(30) MHz, D₁=1.840(8) kHz, x_{aa}^{Br}=356.4074(65) MHz, C_B=2.48(44) kHz. The order of the atoms is HCNHBr with an N-Br separation of 3.61 Å. (33 refs.)

60702 Multidimensional spectroscopy. I. Perturbation theory. B.Blumich, D.Ziessow (Iwan N. Stranski-Inst., Tech. Univ. Berlin, Berlin, Germany). *Mol. Phys. (GB)*, vol.48, no.5, p.955-68 (10 April 1983).

The quantum states produced by non-linear interaction of a coherent uniform radiation field with dipolar matter are evaluated by a time-dependent perturbation expansion of the density matrix. The non-linear terms of the expansion are Fourier transformed to yield multi-dimensional spectra which indicate the connectivities in the underlying energy level diagrams. The spectra can be measured in experiments with multiple resonance, multiple pulse or stochastic excitation. Although the theory presented is of general validity in coherent spectroscopy, emphasis is placed on its application in non-linear NMR spectroscopy. It illustrates particularly well the common basis of double, 2D correlated and multi-dimensional stochastic magnetic resonance. (21 refs.)

60703 Wavelength dependence of the strengths of the electronic transitions of diatomic molecules. N.E.Kuzmenko, L.A.Kuznetsova, V.K.Mateev. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.137-9 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.235-8 (Aug. 1982). [received: April 1983]

Analytical expressions have been obtained describing the wavelength dependence of the strengths of the electronic transitions for thirty-five electronic systems of diatomic molecules. The recommended S₀^{int}(λ) relationship is particularly convenient for carrying out technical calculations of radiative processes in strongly heated gases and in a low-temperature plasma. (5 refs.)

(for NMR spectra, see 33.25; for EPR spectra, see 33.30)

60704 ^{83}Kr nuclear quadrupole coupling, microwave spectrum, and structure of KrHCN . E.J.Campbell, L.W.Buxton, A.C.Legon (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3483-93 (15 March 1983). Rotational spectra have been observed for ten isotopic species of KrHCN using the pulsed Fabry-Perot Fourier transform technique. The ^{83}Kr nuclear quadrupole coupling constant has been measured in $^{83}\text{KrHC}^{14}\text{N}$, $^{83}\text{KrHC}^{15}\text{N}$, and $^{83}\text{KrDC}^{14}\text{N}$. Values of the rotational constants B_0 , centrifugal distortion constants D_1 and H_1 , ^{14}N and ^{15}N nuclear quadrupole coupling constants are: $^{83}\text{KrHC}^{14}\text{N}$: $B_0 = 1188.50879(211)$ MHz, $D_1 = 47.889(245)$ kHz, $H_1 = 72.1(75)$ Hz, $\chi_{\text{Kr}} = -3.2719(103)$, $^{83}\text{KrHC}^{15}\text{N}$: $B_0 = 1184.9826$ MHz, $\chi_{\text{Kr}} = -3.2630(60)$, $\chi_{\text{N}} = 7.457(50)$, $^{84}\text{KrHC}^{14}\text{N}$: $B_0 = 1181.55187(38)$ MHz, $D_1 = 46.913(26)$ kHz, $H_1 = 66.6(5)$ Hz, $\chi_{\text{Kr}} = -3.2780(16)$, $^{86}\text{KrHC}^{14}\text{N}$: $B_0 = 1174.91501(51)$ MHz, $D_1 = 46.071(63)$ kHz, $H_1 = 62.9(5)$ Hz, $\chi_{\text{Kr}} = -3.2712(52)$, $^{82}\text{KrHC}^{15}\text{N}$: $B_0 = 1144.01609(45)$, $D_1 = 40.772(31)$ kHz, $H_1 = 56.0(6)$ Hz, $^{83}\text{KrHC}^{15}\text{N}$: $B_0 = 1140.53244$ MHz, $\chi_{\text{Kr}} = 7.540(50)$, $^{84}\text{KrHC}^{15}\text{N}$: $B_0 = 1137.14193(72)$, $D_1 = 39.928(35)$ kHz, $H_1 = 52.5(5)$ Hz, $^{86}\text{KrHC}^{15}\text{N}$: $B_0 = 1130.58509(43)$ MHz, $D_1 = 39.307(30)$ kHz, $H_1 = 52.9(6)$ Hz, $^{83}\text{KrDC}^{14}\text{N}$: $B_0 = 1162.05255$ MHz, $\chi_{\text{Kr}} = -3.4739(139)$, $\chi_{\text{N}} = 8.034(45)$, $^{84}\text{KrDC}^{14}\text{N}$: $B_0 = 1158.64567(82)$ MHz, $D_1 = 26.973(48)$ kHz, $H_1 = 27.2(8)$ Hz, $\chi_{\text{Kr}} = -3.4937(80)$. (a) Calculated using $D_1 = 47.401$ kHz, $H_1 = 69.4$ Hz. (b) Calculated using $D_1 = 40.350$ kHz, $H_1 = 54.3$ Hz. (c) Calculated using $D_1 = 26.973$ kHz, $H_1 = 27.2$ Hz. These constants are consistent with a linear or near-linear configuration, with a Kr-HCN center-of-mass separation of 4.54 Å, and the Kr atom located 27° off the HCN figure axis on average, where the vertex of this angle is placed on the HCN center-of-mass. KrHCN exhibits unusually large centrifugal distortion in comparison with previously studied Kr-hydrogen halide systems. The authors find that the measured ^{83}Kr nuclear quadrupole coupling constants in $^{83}\text{KrHC}^{14}\text{N}$ and $^{83}\text{KrDC}^{14}\text{N}$ are consistent with a long range polarization model previously used to explain values of χ_{Kr} in KrH(D)Cl and KrH(D)F . (39 refs.)

60705 The rotational spectrum and molecular structure of the benzene-hydrogen chloride complex. W.G.Read, E.J.Campbell, G.Henderson (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3501-8 (15 March 1983). The microwave spectrum of the weakly bound complex benzene-HCl was studied in the gas phase using Fourier transform microwave spectroscopy carried out in a Fabry-Perot cavity with a pulsed supersonic nozzle as the molecular source. Several R-branch α -dipole transitions have been observed for benzene- ^2H ^{35}Cl , benzene- ^2H ^{37}Cl , and benzene- (d_6) - ^2H ^{35}Cl . The spectrum was characteristic of a symmetric top, indicating that the time averaged displacement of the H and Cl atoms from the benzene C_6 axis is zero. Deuterium substitution of HCl demonstrated that the acidic proton lies between the Cl atom and the benzene ring. The chlorine nuclear quadrupole coupling constant χ_{Cl} was measured for all four isotopic species and is interpreted in terms of a projection of the chlorine quadrupole coupling constant in free HCl, averaged over two degenerate vibrational ground state bending modes involving the angles between the benzene C_6 axis and the HCl bond axis. The spectroscopic constants for benzene-HCl are: Benzene- ^2H ^{35}Cl : $B_0 = 1237.6835(5)$ MHz, $D_1 = 1.22(1)$ kHz, $D_{JK} = 13.35(2)$ kHz, $\chi_{\text{Cl}} = 52.19(2)$ MHz, Benzene- ^2H ^{37}Cl : $B_0 = 1201.925(2)$ MHz, $D_1 = 1.16(4)$, $D_{JK} = 13.4(8)$ kHz, $\chi_{\text{Cl}} = -41.2(3)$ MHz, Benzene- (d_6) ^{35}Cl : $B_0 = 1228.2440(6)$ MHz, $D_1 = 1.19(2)$, $D_{JK} = 14.57(3)$, $\chi_{\text{Cl}} = -54.70(2)$ MHz, Benzene- (d_6) ^{37}Cl : $B_0 = 1165.1542(6)$ MHz, $D_1 = 1.08(1)$, $D_{JK} = 10.93(4)$ kHz, $\chi_{\text{Cl}} = -52.25(2)$ MHz. Numbers in parentheses represent one standard deviation in the fit. (36 refs.)

60706 The structure and molecular properties of the acetylene-HCN complex as determined from the rotational spectra. P.D.Aldrich, S.G.Kukulich, E.J.Campbell (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3521-30 (15 March 1983). The microwave spectra for four isotopic species of a complex formed between acetylene and HCN have been obtained using the pulsed, Fourier-transform method with gas pulsed into an evacuated Fabry-Perot cavity. The spectra indicate the complex to be a T-shaped near-prolate asymmetric rotor ($\kappa = -0.993$) in its ground vibrational state in which HCN lies on the C_2 symmetry axis with the hydrogen atom of HCN pointing to the middle of the triple bond of acetylene. The carbon atom of HCN is situated 3.656 Å from the acetylene center of mass. Nuclear quadrupole coupling constants for N are obtained for all four isotopes and deuterium quadrupole coupling constants are obtained for two isotopes. Various contributions to the electric field gradients at quadrupolar nuclei are discussed. (35 refs.)

60707 Centrifugal distortion and internal rotation analysis of the microwave spectrum of ethyl fluoride. E.Fliege, H.Dreizler (Abteilung Chem. Phys., Inst. für Phys. Chem., Univ. Kiel, Kiel, Germany), J.Demaion, D.Boucher, J.Burie, A.Dubrule. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3541-4 (15 March 1983). The internal rotation fine structure of the microwave spectrum of ethyl fluoride $\text{CH}_3\text{CH}_2\text{F}$ was resolved and analyzed in the ground state. The assignment of the high J lines was checked by a centrifugal distortion analysis. The barrier height V_3 determined from the ground state is 3349 ± 4 cal/mol. (18 refs.)

60708 The rotational spectrum and molecular structure of the furan-HCl complex. J.A.Shea, S.G.Kukulich (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3545-51 (15 March 1983). The microwave spectrum of the furan-HCl complex in the ground vibrational state has been measured and assigned using a Fourier-transform microwave spectrometer employing a Fabry-Perot cavity and a pulsed supersonic nozzle as a molecular source. Furan-HCl is planar, with the axis of the HCl subunit oriented along the a axis of furan, bisecting the oxygen-carbon angle. A hydrogen bond is formed between the HCl proton and the lone electron pair of oxygen. The spectroscopic constants for furan- ^{35}Cl in MHz are: $A'' = 9421.3(39)$, $B'' = 1004.2001(27)$, $C'' = 904.5526(26)$, $\tau_1 = -0.9392(12)$, $\tau_2 = -0.0751(2)$, $\tau_{\text{bbbb}} = -0.004$ 01(19), $\tau_{\text{cccc}} = -0.002$ 17(17), $\chi_{\text{aa}} = -52.803(17)$, $\chi_{\text{bb}} = 25.626(54)$, and $\chi_{\text{cc}} = 27.177(54)$. Rotational transitions for the isotopic species furan- ^{37}Cl and furan- ^2H ^{35}Cl were also measured and assigned. The oxygen-chlorine distance is 3.26(1) Å. The binding of the HCl to oxygen, rather than to the π bonds between the β carbon atoms, was confirmed by measurements on the 2-D furan- ^{35}Cl complex. (18 refs.)

60709 Microwave spectrum, structure, and quadrupole coupling for the ethylene-hydrogen cyanide complex. S.G.Kukulich, W.G.Read, P.D.Aldrich (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3552-6 (15 March 1983). Microwave spectra for the complexes ethylene-HCN and ethylene-DCN were observed with the pulsed beam, Fourier transform spectrometer. The complexes are T shaped with the HCN hydrogen atom adjacent to the C-C double bond of ethylene. The HCN molecule lies on a line perpendicular to the plane of ethylene and passing through the ethylene center of mass. The HCN carbon atom is 3.702(10) Å above the ethylene plane. The nitrogen quadrupole coupling strength is $eQq_{\text{aa}}(\text{N}) = -4.363(2)$ MHz for ethylene-HCN and $eQq_{\text{aa}}(\text{N}) = -4.396(3)$ MHz for ethylene-DCN. The deuterium quadrupole coupling strength is $eQq_{\text{aa}}(\text{D}) = 0.178(7)$ MHz for ethylene-DCN. The anisotropy in the nitrogen quadrupole coupling $eQ(q_{\text{bb}} - q_{\text{cc}})(\text{N})$ is 0.013(3) MHz for ethylene-HCN and 0.047(12) MHz for ethylene-DCN. The rotational constants are: for ethylene-HCN, $A = 25496(689)$, $B = 1906.581(5)$, $C = 1808.878(5)$ and for ethylene-DCN, $A = 24960(1101)$, $B = 1904.739(6)$, $C = 1807.344(6)$. Centrifugal distortion constants D_J and D_{JK} were obtained. (13 refs.)

60710 Beam maser spectroscopy on CD_3CN . A.M.Murray, S.G.Kukulich (Dept. of Chem., Univ. of Arizona, Tucson, AZ, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3557-9 (15 March 1983). The $J=1-0$ rotational transitions of CD_3CN were measured using a two-cavity molecular beam maser spectrometer. This spectrometer employs the Ramsey method of separated oscillating fields to obtain very high resolutions and allows precise measurements of the hyperfine structure splittings. The nitrogen quadrupole coupling constant is $eQq_{\text{aa}}(\text{N}) = -4229.2 \pm 0.6$ kHz and the deuterium quadrupole constant is $eQq_{\text{aa}}(\text{D}) = -55.1 \pm 0.4$ kHz. Assuming cylindrical symmetry about the C-D bond axis the authors obtain the C-D bond-axis deuterium quadrupole coupling strength of $eQq_{\text{aa}}(\text{D}) = 169.6 \pm 4.5$ kHz. The b-axis rotational constant, and nitrogen and deuterium spin-rotation interaction strengths are also reported. (9 refs.)

60711 Microwave spectral study of bicyclo[2.2.2]octene and bicyclo[2.2.2]octadiene. R.N.Nandi, M.D.Harmony (Dept. of Chem., Univ. of Kansas, Lawrence, KS, USA), A.E.Howard, S.W.Staley. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3560-1 (15 March 1983). Microwave spectral studies of bicyclo[2.2.2]octene (C_8H_{12}) and bicyclo[2.2.2]octadiene (C_8H_{10}) have led to the following rotational constants in MHz: for C_8H_{12} , $A = 2576.721 \pm 0.002$, $B = 2508.998 \pm 0.002$, $C = 2462.272 \pm 0.009$; and for C_8H_{10} , $A = 2730.116 \pm 0.002$, $B = 2650.520 \pm 0.002$, $C = 2631.710 \pm 0.002$. The dipole moments of the C_8 molecules have also been obtained, the values along the symmetry axis being $\mu_a = 0.253 \pm 0.001$ D for C_8H_{12} and $\mu_c = 0.432 \pm 0.002$ D for C_8H_{10} . (11 refs.)

60712 Microwave spectrum, dipole moment, barrier to internal rotation of 1,1-dimethylborane. C.W.Chui, A.B.Burg, R.A.Baudet (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3562-6 (15 March 1983). The microwave spectra of four isotopic species of 1,1-dimethylborane have been investigated in the region between 18.0 and 40.0 GHz. The observed rotational constants (MHz) for the normal species are $A = 7070.68(7)$, $B = 6606.57(3)$, $C = 3660.33(1)$; for $^{10}\text{B}_2$ species, $A = 7069.87(15)$, $B = 6605.79(5)$, $C = 3659.88(3)$; and for $^{10}\text{B}_2$ species, $A = 7070.63(27)$, $B = 6889.89(10)$, $C = 3745.92(6)$. The B-B distance determined by the Kraitchman method is 1.76(2) Å. The carbon-boron structure could be fitted to the moments of inertia by assuming reasonable values for the other structural parameters: $r(\text{B}-\text{C}) = 1.59$ Å and $\angle \text{CBC} = 121.2^\circ$. From the Stark effect measurements, the dipole moment is measured to be 0.87(3) D. Assuming no coupling between the rotors, the barrier height to internal rotation is 1.39(16) kcal/mol. (15 refs.)

Electric dipole moment of the diatomic TIF in its higher vibrational states See Entry 60779

33.20E Infrared spectra

60713 FTIR spectra of $(\text{HF})_3$ species in solid argon at 12K. L.Andrews, G.L.Johnson (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.133-8 (1 April 1983). Condensation of argon/HF mixtures at 12K revealed sharp new 3825.5 and 3702.0 cm^{-1} absorptions which exhibited different growth behaviour on sample warming. Mixed HF/DF samples revealed a single mixed isotopic satellite near the DF counterpart of the former band assigned to $(\text{HF})_2$ and a group of satellites for the latter band assigned to $(\text{HF})_3$. (20 refs.)

60714 On the 1 μm system of iron hydride. W.J.Balfour, B.Lindgren (Inst. of Phys., Univ. of Stockholm, Stockholm, Sweden), S.O'Connor. *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.251-2 (1 April 1983). The 987.7 nm system of FeD has been shown by rotational analysis of the (1,0) and (0,0) bands to be due to a $^4\Delta-^4\text{F}$ electronic transition. The bond lengths in the $v=0$ levels of the upper and lower states are $r'_0 = 0.1705$ nm and $r''_0 = 0.1589$ nm, respectively, and the $(v'=1)-(v'=0)$ vibrational interval of the upper state is ≈ 1035 cm^{-1} . (7 refs.)

60715 The infrared absorption spectrum of a supersonic expansion of methyl chloride. D.L.Snively, D.L.Wiberg, S.D.Colson (Sterling Chem. Lab., Yale Univ., New Haven, CT, USA). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.319-23 (8 April 1983). The infrared absorption spectrum of a rotationally cooled supersonic jet of neat methyl chloride is reported. The rotational constants of ν_3 , ν_2 and ν_1 are determined. Using a 0.05 mm nozzle diameter and a 2 atm stagnation pressure, a Boltzmann population distribution is found with a characteristic rotational temperature of 120K. (14 refs.)

60716 Distribution of gauche bonds in crystalline $n\text{-C}_{21}\text{H}_{44}$ in phase II. R.G.Snyder, M.Marocelli, H.L.Strauss (Dept. of Chem., Univ. of California, Berkeley, CA, USA), C.A.Elliger, D.G.Cameron, H.L.Casal, H.H.Mantsch. *J. Am. Chem. Soc. (USA)*, vol.105, no.1, p.133-4 (12 Jan 1983). Significant conformational alteration has been shown to exist in crystalline n-alkanes in phase II, the 'hexagonal' or 'rotator' phase as it is sometimes called. This disorder, which is manifest as a low concentration of gauche bonds in otherwise trans-planar chains, makes phase II n-alkanes a particularly suitable model system for the study of more complex assemblies of hydrocarbon chains such as lipid bilayers. The distribution of defects along the chain still remains in question. The authors report the results of an infrared study in which the concentration of gauche bonds located at four sites in the n-alkane $n\text{-C}_{21}$ in phase II was determined directly. In summary they have found that conformational disorder may occur anywhere along the chain although it tends to be greatest nearest the chain ends. (13 refs.)

60717 Photochemical formation and dissociation of molybdenum-dinitrogen complexes in krypton matrices. T.Foosnaes, M.J.Pellin, D.M.Gruen (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.2889-98 (15 March 1983). Three molybdenum-dinitrogen complexes $[\text{MoN}_2]$, $[\text{Mo}_2(\text{N}_2)_2]$ and $[\text{Mo}(\text{N}_2)_3]$ have been synthesized in Kr matrices and characterized by means of the effects of isotopic substitution on the dinitrogen stretching frequencies. The Mo-N force constants calculated from these spectra are found to be 17.21 ± 0.02 mdyn/Å for MoN_2 and $f_r = 18.72$ mdyn/Å and $f_{rr} = 0.36$ mdyn/Å for $\text{Mo}(\text{N}_2)_3$. The Mo complexes appear to be unique in that rapid formation during co-deposition with N_2 occurs only upon photoexcitation of the Mo $^5s^2\text{P}$ atomic resonance transition situated at 355 nm in Kr matrices. Although minor amounts of the dinitrogen complexes are formed during deposition in the absence of radiation, their concentration is not increased by thermal annealing. Each of the complexes gives rise to its own electronic absorption spectrum. Irradiation into the electronic absorption bands of individual complexes induced selective photodissociation. Photoinduced growth and decomposition studies allowed correlations to be made between the vibrational and corresponding electronic spectra. (31 refs.)

60718 The infrared absorption spectra of $(\text{HCCCH})_2$ and $(\text{DCCD})_2$. R.D.Pendley, G.E.Ewing (Dept. of Chem., Indiana Univ., Bloomington, IN, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3531-40 (15 March 1983). The infrared absorption bands of acetylene dimers have been investigated with long path low temperature Fourier transform infrared spectroscopy. Five bands were found, three of $(\text{HCCCH})_2$ and two of $(\text{DCCD})_2$. Four of these bands can be assigned as coupled monomer modes. Normal mode analysis based on a theoretical intermolecular potential confirms these assignments. One band shows evidence of fast vibrational predissociation, and a symmetry based argument is made to support the claim that the predissociation fragments are rotationally excited. (29 refs.)

60719 $^2\text{I}^+ \text{I}^- \text{X}^{2+}$ infrared electronic transition of C_2H^+ . P.G.Carrick, A.J.Merer, R.F.Curl, Jr. (Chem. Dept., Rice Univ., Houston, TX, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3652-8 (15 March 1983). Five bands of the $^2\text{I}^+ \text{I}^- \text{X}^{2+}$ lowest electronic transition of C_2H^+ have been observed in the region 3600-4200 cm^{-1} in an argon discharge over polycetylene using color center laser spectroscopy with magnetic rotation sensitivity enhancement. The band origins are approximately 3692, 3773, 3785, 4011, and 4106 cm^{-1} . Rotational assignments and preliminary fittings of all five bands have been made. Four of the bands have a $^2\Sigma^+$ lower vibronic state which is undoubtedly the ground vibronic state of the molecule, and different $^2\text{I}^+$ upper vibronic states which correspond to mixtures of the lowest vibronic state of the A electronic state and three different vibrationally excited levels of the X electronic state with an odd number of quanta in the bending mode and overall $^2\text{I}^+$ symmetry. These three ground state vibrational levels have been tentatively assigned as (1,1,0), (0,1,2), and (0,5,1). The four $^2\text{I}^+$ vibronic levels are mixed by vibronic coupling between the X and A electronic states thereby providing electronic oscillator strength for the vibrational transitions. The fifth band is a $^2\Sigma^+ \text{I}^+ \text{I}^-$ hot band with the lower state the first excited bending level (0,1,0) of the ground electronic state and upper state the $^2\Sigma^+$ component of the (0,1,0) excited bending level of the excited electronic state. From these observations a value of 1.30 Å for the CC bond length in the excited electronic state and a value of ~ 375 cm^{-1} for the bending frequency of the X ground electronic state are obtained. (24 refs.)

60720 Difference frequency laser spectroscopy of the ν_1 band of the HO_2 radical. C.Yamada, Y.Endo, E.Hirota (Inst. for Molecular Sci., Okazaki, Japan).

J. Chem. Phys. (USA), vol.78, no.7, p.4379-84 (1 April 1983). The ν_1 (O-H stretching) band of the HO_2 radical was observed in absorption by using a difference frequency output obtained from an Ar ion laser and a CW dye laser as a source, combined with a multiple-reflection discharge cell. Zeeman modulation was employed to improve the sensitivity. The HO_2 radical was generated directly in the cell by a DC discharge in a mixture of allyl alcohol and oxygen. About 280 lines were observed and analyzed to precisely determine the rotational constants, centrifugal distortion constants, and spin-rotation interaction constants in the $\nu_1 = 1$ state. The band origin was determined to be 3436.1951(4) cm^{-1} , which is 22 cm^{-1} higher than the value previously obtained by a matrix isolation study. (29 refs.)

60721 Infrared matrix isolation spectrum of the Si_2C molecule. Z.H.Kafafi, R.H.Hauge, L.Fredin, J.L.Margrave (Dept. of Chem., Rice Univ., Houston, TX, USA). *J. Phys. Chem. (USA)*, vol.87, no.5, p.797-800 (3 March 1983). Infrared spectra of Si_2^{12}C and Si_2^{29}C isolated in solid argon in 15K have been reported in the 400-4000- cm^{-1} region. Two absorptions at 1188.9 and 658.2 cm^{-1} that exhibit carbon-13 shifts of 35.2 and 14.9 cm^{-1} , respectively, have been detected. Based on the measured IR data, the authors conclude that the molecule has C_{2v} symmetry with a lower limit of 110° for the SiCSi bond angle. (21 refs.)

60722 Detection of the free rotation of NH_3 molecules in polymers from the far IR spectra. N.M.Grigorovich, M.V.Tonkov. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.116-17 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.194-6 (Aug. 1982). [received: April 1983]

The authors obtained the IR absorption spectrum of ammonia dissolved in the polymeric material poly-4-methylpent-1-ene, which indicates that the free rotation of the NH_3 molecules is preserved on going from the gaseous phase to the polymer matrix. The results also indicate that it is possible to determine the concentration of ammonia and to study its properties in polymeric matrices from far IR absorption data. (2 refs.)

60723 Intramolecular-vibration spectra of D_2O in H_2O ice matrices. Calculation and interpretation of the contours of the IR absorption and Raman scattering. Yu.Ya.Efimov, Yu.I.Naberukhin. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.157-62 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.270-7 (Aug. 1982). [received: April 1983]

On the basis of a theoretical calculation, the form of the bands of the recently recorded IR spectra has been reconstructed, and the form of the Raman spectra is predicted for molecules of heavy water in matrices of cubic and amorphous ice H_2O , and the results have been interpreted. The values of the intramolecular parameters of the D_2O molecules in the above mixed ice specimens have been established. A simple method for calculating the spectral frequencies and intensities for an ensemble of molecules of the water type, perturbed in nonequivalent fashion by the medium, has been demonstrated. In the particular case of the interaction of infinitely narrow and broad distributions of the vibrational frequencies, an analytical expression for the envelope of the spectral contour has been given. The anomalous broadening of the intramolecular spectra is explained quantitatively by fluctuations in the parameters of the hydrogen bonds in the specimen. The important role of

Fermi resonance in the production of the ice spectra has been demonstrated. (21 refs.)

33.20F Raman and Rayleigh spectra (inc. scattering)

60724 Resonance Rayleigh light scattering of some porphyrins in solution: intensities and depolarization ratios. J.Anglistter, I.Z.Steinberg (Dept. of Chem. Phys., Weizmann Inst. of Sci., Rehovot, Israel). *Chem. Phys. (Netherlands)*, vol.75, no.3, p.443-52 (15 March 1983).

Resonance Rayleigh light scattering was measured at the Soret absorption band of meso-tetraphenyl porphine (in the free-base form), chlorophyll a, and meso-tetra(4-pyridyl) porphine (in the fully protonated form). The last compound showed unexpected fluorescence on the red side of, but close to, its Soret absorption band, and scattering experiments were not possible in the spectral range where fluorescence was detectable. The depolarization ratios measured for the Rayleigh scattered light of all three compounds were close to the value 1/8 expected for a planar oscillator, in line with previous conclusions that even when the in-plane degeneracy is lifted, the splitting of the in-plane bands at the Soret frequencies is small and the two transitions overlap considerably. The observed discrepancy between the experimentally determined intensities and those calculated from the absorption spectra may be due to momentary heterogeneity in the absorption coefficients, ϵ , in the population of absorbing molecules, the absorption and scattering depending each on different averages of ϵ . This heterogeneity is accentuated in the red part of the bands, where transitions from thermally excited molecules are more pronounced than in other parts of the absorption bands. (22 refs.)

60725 Raman spectra, ab initio molecular orbital calculations, vibrational analysis, and thermodynamic functions for NH_3AlX_3 ($\text{X} = \text{F}, \text{Cl}, \text{Br}$). G.N.Papatheodorou, L.A.Curtiss, V.A.Maroni (Argonne Nat. Lab., Argonne, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3303-15 (15 March 1983). Raman spectra of gaseous NH_3AlCl_3 and NH_3AlBr_3 were recorded at 400°C . The observed Raman frequencies for combination with reported infrared frequencies for NH_3AlCl_3 and ab initio molecular orbital calculations on NH_3AlCl_3 and NH_3AlF_3 were used to derive force constants for all three NH_3AlX_3 complexes ($\text{X} = \text{F}, \text{Cl}, \text{Br}$) based on an adjusted valence force field (AVFF) concept. The resulting force constant calculations produced complete sets of A_1 and E mode frequencies for each complex. Statistical mechanical analyses were then performed using the A_1 and E mode frequencies together with estimated values for the torsional mode of each complex and published enthalpy data. From these analyses, the relative thermodynamic stability of each complex was determined. At 700 and 1000K, NH_3AlCl_3 was found to be more stable than NH_3AlBr_3 . It was further predicted that the reaction of gaseous NH_3 with solid AlF_3 to form NH_3AlF_3 is not favored in this temperature range, which provides an explanation for the lack of success in prior efforts to produce NH_3AlF_3 . (37 refs.)

60726 Reorientation of small molecules and anions in solution studied by resonance enhanced dynamic Rayleigh scattering. S.G.Stanton, R.Pecora (Dept. of Chem., Stanford Univ., Stanford, CA, USA), B.S.Hudson. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3363-71 (15 March 1983). Resonance enhanced dynamic depolarized Rayleigh scattering is used to measure reorientation times of two nitrophenolate anions in millimolar aqueous and ethanolic solutions. Reorientation times of the corresponding neutral molecules in 0.01 to 0.1 M solutions are also reported. The reorientation time of 3,4-dinitrophenolate anion has a linear viscosity dependence when the viscosity is varied by varying temperature. The ratio of reorientation time

to viscosity C is the same for neutral 3,4-dinitrophenol and its anion in water to within experimental error. In ethanol the C values for both neutral molecule and anion are much larger than the corresponding water values and the anion C value depends upon counterion. This final observation suggests ion pairing occurs in these solutions. The spectra of picrate salts in ethanol clearly show the presence of a second species (ion pair). The picrate anion C value in ethanol determined from the broad component of a two Lorentzian fit is slightly larger than the corresponding water value. The results from the work are compared with reorientation times of small anions reported in the literature, most of which were obtained using picosecond absorption and fluorescence techniques. Ion pairing has not been properly accounted for in many of these experiments, preventing further conclusions concerning solute-solvent interactions. Some suggestions for further experiments are given. (38 refs.)

60727 Vibrational phase relaxation in ethane at moderate densities, including the critical region. K.A.Wood, H.L.Strauss (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3455-61 (15 March 1983). The bandwidth of the isotropic component and the frequency of the ν_3 (C-C stretch) Raman band of ethane have been measured for a range of densities at constant temperature, and for a range of temperatures at the critical density. No critical anomaly is observed. The rotation-vibration coupling contribution to the bandwidth is calculated. The remaining contribution to the bandwidth increases with increasing density in a manner consistent with current theories that take into account both the repulsive and attractive intermolecular forces. However, the attractive force contribution cannot be related in a simple fashion to the macroscopic compressibility. Data taken over a wider range of density and temperature will be required to quantitatively determine the separate repulsive and attractive contributions to the width. (35 refs.)

60728 Tricopper. A fluxional molecule. D.P.DiLella, K.V.Taylor, M.Moskovits (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).

J. Phys. Chem. (USA), vol.87, no.3, p.524-7 (3 Feb. 1983). The resonance Raman spectrum of matrix-isolated Cu_3 is reported. On the basis of the irregularity of the observed progression and the unusual isotopic structure shown by the vibrational spectral components, Cu_3 is proposed to be a fluxional Jahn-Teller molecule. A symmetric stretching frequency of 354 cm^{-1} is found for the molecule. (8 refs.)

60729 Homogeneous and inhomogeneous vibrational dephasing processes in aqueous thiocyanate solutions. T.Kato (Seibo Women's Jr. Coll., Kyoto, Japan).

Mol. Phys. (GB), vol.48, no.5, p.1119-29 (10 April 1983). The vibrational correlation functions are calculated from the isotropic Raman spectra for the CN stretching mode of SCN^- anions in aqueous LiSCN, NaSCN and KSCN solutions, at concentrations 1-10 M and at temperatures 30, 55 and 80°C . These correlation functions are analysed on the basis of a model of simultaneous homogeneous and inhomogeneous vibrational dephasing, and both the homogeneous and inhomogeneous broadening contributions are extracted. The CN mode in aqueous thiocyanate solutions is found to be inhomogeneously broadened to various degrees depending on cation species, concentration and temperature. The homogeneous contribution increases and the inhomogeneous contribution decreases with increasing temperature because of increased molecular motion. Increase of salt concentration is found to develop inhomogeneity, probably because the strong interaction in concentrated solutions results in long lived local structures. An increase of inhomogeneous and a decrease of homogeneous broadening contributions with increasing salt concentration compensate in KSCN solutions. However, in LiSCN and NaSCN solutions, the increase of inhomogeneous contribution dominates the homogeneous contribution, which leads to concentration broadening. The band in 10 M LiSCN solution at 30°C , which is the broadest of all the CN bands investigated here, is found to be broadened only by the inhomogeneous process. (4 refs.)

60730 Picosecond CARS study of the ν_2 -band of liquid benzene. G.Barowsky (Abteilung Laserphys., Max-Planck-Inst. für Biophys., Göttingen, Germany), P.Anliker, Q.Munir.

Opt. Commun. (Netherlands), vol.45, no.3, p.183-6 (1 April 1983). A picosecond CARS-study, using mode-locked CW-lasers has been performed to record the spectrum of the CH-stretching mode (ν_2 -band) of liquid benzene. From the shape of the spectrum centered at 3061.9 cm^{-1} a dephasing time $\tau_{\text{ph}} = 0.7 \text{ ps}$ has been derived together with a nonresonant background contribution to $\chi^{(2)}$ of 14% at resonance. (13 refs.)

60731 Measurement of relative effective Raman scattering cross sections for hydrogen, oxygen, and water molecules under ultraviolet excitation. A.A.Eliseev, T.N.Popova, O.V.Ravodina, V.V.Stenina.

Opt. & Spectrosc. (USA), vol.53, no.2, p.190-2 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.328-31 (Aug. 1982). [received: April 1983] Presents the results of measurements of the relative (with respect to the cross section of the Q branch of the Raman vibration band for N_2) effective cross sections of vibrational Raman scattering by H_2O , H_2 , and O_2 molecules. The effective Raman cross section for an O_2 molecule was measured to check the validity of the experimental methods, because this cross section has been reliably determined for the visible and UV spectral regions. As a source of excitation an LGI-21 pulsed molecular-nitrogen laser with $\lambda = 337.1 \text{ nm}$ and an average power of $\approx 3 \text{ mW}$ was used. (13 refs.)

60732 Wavelength dependence of Raman scattering cross sections from 200-600 nm. W.K.Bischel, G.Black (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).

Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.TuB4/1-4 The authors have used a combination of ArF, KrF, and Nd:YAG lasers to experimentally determine the wavelength dependence of the absolute vibrational Raman scattering cross section for H_2 , D_2 , CH_4 , N_2 , and O_2 for laser wavelengths spanning the range of 200-600 nm. (6 refs.)

60733 Temperature dependence of the Raman linewidth in H_2^+ . W.K.Bischel, M.J.Dyer (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).

Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.TuB4/1-4 Using CW stimulated Raman gain spectroscopy (SRGS), the authors have measured the temperature dependence of the Raman linewidth in H_2 from 223 to 433 K . For a constant density of 10 amagat , the authors observe an increase in the linewidth of approximately 0.4% per K . (4 refs.)

33.20K Visible spectra

60734 The high-resolution visible overtone spectrum of acetylene. G.J.Scherer, K.K.Lehmann, W.Klemperer (Dept. of Chem., Harvard Univ., Cambridge, MA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.2817-32 (15 March 1983). Direct, gas-phase overtone spectra of states corresponding to five and six quanta of C-H stretch have been obtained for the four isotopically substituted acetylenes in the region 14900 - 18500 cm^{-1} . Peak positions of individual rotation-vibration lines were determined to a precision of about 0.003 cm^{-1} . A total of 39 bands are analyzed: 16 for $^{12}\text{C}_2$; 14 for $^{13}\text{C}_2\text{H}_2$; five for $^{12}\text{C}^{13}\text{CH}_2$; and four for $^{12}\text{C}_2\text{HD}$. The rotational structure of the bands is fit to a semirigid rotor Hamiltonian. However, the band suffer from severe rotational perturbations, with typical matrix elements being on the order of 0.3 cm^{-1} or less. The error in the determined band origins varies between 0.001 and 0.1 cm^{-1} , depending on the degree of perturbation. Precision rotational constants are also determined for the observed bands. The vibrational term values cannot be adequately explained in terms of the usual slightly anharmonic normal mode expansion. Even though acetylene represents in an intermediate case between the local mode and normal mode limits, the simple local mode theory described by Child and Lawton [M.S. Child and R.T. Lawton, Faraday Discuss., vol.71, p.273 (1981)] can be used to rationalize many aspects of the spectrum—e.g., the splitting of the states $[005^0 0 1]$ and $[005^0 0 1']$ is found to be only 0.44 cm^{-1} . The intermediate character of acetylene is seen upon single deuterium substitution. The state corresponding to five quanta of ^{12}C -H stretch shifts about 100 cm^{-1} to the blue, a result which is certainly anomalous from the point of view of intuitive local mode theory. The band origins for the observed Σ - Σ transitions for all four acetylenes studied are found to be in good agreement with the results of a recent variational calculation [L. Halonen, M.S. Child, and S. Carter, Mol. Phys., vol.47, p.1097 (1982)]. It is also observed that the anharmonic shifts of the sequence band transitions are quite large—for the $\nu=5$ overtone band, the sequence bands are shifted 74 cm^{-1} for the I_g bend and 39 cm^{-1} for the I_u bend. (43 refs.)

60735 Electronic spectra and intramolecular proton transfer in Mannich bases in liquid and solid vitreous solutions. M.Rospenk, I.G.Rumynskaya, V.M.Shraber.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.526-30 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.756-61 (May 1982). [received: Feb. 1983]

The authors set out to ascertain, first, whether proton transfer and the establishment of equilibrium in nonpolar and slightly polar solvents, as well as in systems in which the equilibrium is not observed and in polar solvents can be recorded spectroscopically at lower temperatures secondly, to measure the equilibrium constants and determine the thermodynamic characteristics of proton transfer; and finally, to investigate the behaviour of the equilibrium as the solvent is converted from liquid to the rigid vitreous state. (14 refs.)

60736 High-resolution study of InCl spectra. J.Borkowska-Brunecka, W.Zyrynicky (Inst. of Inorganic Chem. & Metall. of Rare Elements, Tech. Univ. Wrocław, Wrocław, Poland).

Physica B & C (Netherlands), vol.115 B+C, no.3, p.415-18 (March 1983). The rotational structure of the $^1\text{X}^1\Sigma^+ 0-0$ and $0-1$ bands and the $^3\text{X}^1\Sigma^+ 0-0$ subbands have been reanalyzed at high resolution. Rotational constants of the upper states have been corrected and improved. (15 refs.)

60737 New results on EDA-iodine complexes. F.Lux, R.Pactzold (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1125-9 (1982). In German.
The ionisation energies of R'R'SO donors are related to both the thermodynamic stability and the blue-shift of the visible iodine band of R'R'SO-I₂ complexes. For decreasing ionisation energies an increase of $-\Delta H$, $-\Delta G$ and $\Delta\lambda_{1/2}$ is observed. A comparison of these results with the corresponding data of R'R'R'PO-I₂ complexes shows that the correlation for both oxodonor series are different. For EDA complexes between iodine and ethyl- and ethoxysubstituted R'R'R'PS donors a linear dependence of the position of the CT band on the donor ionisation energy is found. (8 refs.)

60738 The triatomic rare gas halide excimers. D.L.Huestis (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA), G.Marowsky, F.K.Tittel. *Physical Meeting on Excimer Lasers*, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.TuC4/1.
Summary form only given as follows. Reviews the spectroscopy and kinetics of broad-band triatomic excimers. Laser considerations such as gain and absorption are also discussed, with emphasis on Xe₂Cl. (no refs.)

33.20L Ultraviolet spectra

60739 Supersonic expansion cooling of electronically excited OH radicals. A.T.Droege, P.C.Engelking (Dept. of Chem., Univ. of Oregon, Eugene, OR, USA). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.316-18 (8 April 1983).

Supersonic nozzle cooling of excited-state molecular radicals produced in a corona discharge is demonstrated and investigated using hydroxyl radicals. Rotational temperatures of 11 ± 2 K and vibrational temperatures of 3400 ± 300 K are typically observed in the OH A²Σ⁺ state. (10 refs.)

60740 A model for the interpretation of the electronic spectra of the complex ions M(bpy)₃²⁺ (M=Fe, Ru, Os) in D₃ and C₂ sites. J.Ferguson, F.Herren (Res. School of Chem., Australian Nat. Univ., Canberra, Australia). *Chem. Phys. (Netherlands)*, vol.76, no.1, p.45-59 (1 April 1983).

A theoretical model of the electronic structure of the metal-to-ligand charge-transfer states of the complex ions M(bpy)₃²⁺ (M=Fe, Ru, Os) is described. It is applied to new spectroscopic data obtained for these ions in two host crystals. In one host the site symmetry of the guest is close to D₃, while in the other it is C₂. The model has four parameters, the spin-orbit coupling constant of M²⁺, the trigonal field splitting of the metal-ion d orbitals, the trigonal field splitting of the ligand orbitals and an exchange integral between the metal-ion d electrons and the ligand π electrons. Analyses of the absorption spectra are consistent with the energy order $\epsilon < a_1$ for the metal-ion d orbitals. The major source of the charge-transfer intensity comes from the transfer term. A detailed analysis of the luminescence from Ru(bpy)₃²⁺ in both crystal hosts shows that three E states are involved and the model accounts for all of the essential features of the luminescence. (27 refs.)

60741 The vapour-phase ultraviolet spectra of metallo-organic precursors to III-V compounds. J.Haigh (British Telecom Res. Labs., Ipswich, England). *J. Mater. Sci. (GB)*, vol.18, no.4, p.1072-6 (April 1983).

Vapour-phase UV (ultraviolet) spectra are reported for the trimethyls and triethyls of gallium and indium, aluminium triethyl and indium cyclopentadienyl. Strong absorptions are observed between 200 and 300 nm; these are adequate for efficient energy coupling in photolysis. (8 refs.)

60742 High resolution absorption cross section measurements and band oscillator strengths of the (1,0)-(12,0) Schumann-Runge bands of O₂. K.Yoshino, D.E.Freeman, J.R.Esmond, W.H.Parkinson (Harvard-Smithsonian Center for Astrophysics, Cambridge, MA, USA). *Planet. & Space Sci. (GB)*, vol.31, no.3, p.339-53 (March 1983).

Cross sections of O₂ at 300K have been obtained from photoabsorption measurements at various pressures throughout the wavelength region 179.3-201.5 nm with a 6.65 m photoelectric scanning spectrometer equipped with a 2400 lines mm⁻¹ grating and having an instrumental width (FWHM) of 0.0013 nm. The measured absorption cross sections of the Schumann-Runge bands (12,0) through (1,0) in this wavelength region are absolute i.e. independent of the instrumental width, a result not achieved previously. The measured cross sections are presented graphically and are available at wavelength intervals of ~ 0.1 cm⁻¹ as numerical complications stored on magnetic tape from the National Space Science Data Center, NASA/Goddard Space Flight Center, Greenbelt, MD 20771, USA. Band oscillator strengths of the (12,0) through (1,0) bands have been determined by direct numerical integration of the measured cross sections. (45 refs.)

33.20N Vacuum ultraviolet spectra

60743 Rydberg series converging to the \tilde{C} state of C₆F₆⁺ in threshold photoelectron and VUV absorption spectra of hexafluorobenzene. G.Dujardin, S.Leach (Univ. Paris-Sud, Orsay, France). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.337-42 (8 April 1983).

A series of peaks in the threshold photoelectron spectrum (TPES) of hexafluorobenzene in the 13 eV region are found to have the same energies as Rydberg bands in the VUV absorption spectrum. The TPES and VUV absorption features are interpreted as an nd Rydberg series, with a quantum defect $\delta = -0.02$, converging to the C electronic state of C₆F₆⁺ at 13.88 eV. The ion \tilde{C} state is shown to have ²B_{2u} electronic symmetry. (11 refs.)

33.20R X-ray spectra

60744 X-ray absorption spectra of nitrogen and oxygen in the series of N₂, NO, and O₂ molecules. V.N.Akimov, A.S.Vinogradov, T.M.Zimkina. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.63-6 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.109-13 (July 1982). [received: April 1983]

The K absorption spectra of nitrogen and oxygen atoms in N₂, NO, and O₂ molecules, obtained with the aid of a common experimental method, are considered jointly. The correlation between the resonancelike characteristics manifested in the absorption spectra of these molecules is traced, and their nature is evaluated in terms of resonance scattering of the photoelectron by the anisotropic potential of the molecule. It is hypothesized that with a movement along the molecular series N₂-NO-O₂ there is a shift in the shape resonance from the continuous to the discrete region of the spectrum, which is one of the possible causes of the qualitative difference observed in the near-threshold structure of the absorption spectrum of the O₂ molecule and the absorption spectra of the N₂ and NO molecules. (18 refs.)

60745 X-ray absorption spectra of tetrahedral molecules. Characteristic features of the symmetry of the wave function of the photoelectrons. M.Ya.Amusa, A.A.Pavlychev, A.S.Vinogradov, D.E.Onopko, S.A.Titov. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.91-3 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.157-60 (July 1982). [received: April 1983]

Examines changes in the symmetry of the photoelectron wave under the influence of the molecular field. For this purpose the authors carried out calculations of the spectral behavior of the absorption cross section of the SiL₂₃(11)2p subshell of the SiF₄ molecule and the CK(1s)-level of CF₄ in the region of the near fine structure (NFS) and (0 < ε < 2.5 Ry). The wave function (WF) of the final state of the photo-electron χ(ε,r) was determined from the condition of regularity close to the nuclei of the atoms and asymptotic behavior as r → ∞. (7 refs.)

Satellite structure in the 2pσ molecular orbital transitions in slow heavy ion collisions See Entry 60626

33.25 NUCLEAR MAGNETIC RESONANCE AND RELAXATION; NUCLEAR QUADRUPOLE RESONANCE (NQR)

60746 The relativistic theory of the chemical shift. N.C.Pyper (Dept. of Theoretical Chem., Univ. of Cambridge, Cambridge, England). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.204-10 (1 April 1983).

A relativistic theory of the NMR chemical shift for a closed-shell system is presented. The final expression for the shielding, derived by applying two Gordon decompositions to the Dirac current operator, closely parallels the Ramsey nonrelativistic result. (26 refs.)

60747 The Breit interaction in external magnetic fields. N.C.Pyper (Dept. of Theoretical Chem., Univ. of Cambridge, Cambridge, England). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.211-17 (1 April 1983).

The Breit energy of a system, which is shown to depend on the external magnetic vector potential, is exactly transformed, by applying Gordon decompositions, to a form explicitly exhibiting some of the field dependence. The result is used to derive the leading Breit contributions to NMR chemical shifts and atomic g factors. (12 refs.)

60748 Measurement of the ¹⁴N nuclear quadrupole couplings in the lowest (ππ*) excited triplet state of pyrazine by ODMR. W.Frohling, W.J.Winsom, K.Mobius (Inst. für Molekularphys., Freie Univ. Berlin, Berlin, Germany). *Chem. Phys. (Netherlands)*, vol.75, no.3, p.389-94 (15 March 1983).

High-resolution optically detected magnetic resonance (ODMR) and optically detected electron-electron double resonance (ODEEOR) have been performed on the lowest excited triplet states of pyrazine-h₄ and pyrazine-d₄, as dilute guests in polycrystalline benzene and cyclohexane host matrices. Computer simulated spectra have been fitted to those experimentally observed, using a spin Hamiltonian which takes into account the ¹⁴N and ¹H (or ²D) nuclei of the pyrazine guest molecule. Good agreement is obtained when one ¹⁴N nuclear quadrupole energy difference, |e_NN₁-e_NN₂| ≤ 1.3 MHz, and the remaining component, |e_NN₁| = 0.6 ± 0.2 MHz for pyrazine-d₄ in benzene-d₆. (25 refs.)

60749 NMR study of intramolecular processes in EDTA metal complexes. M.C.Gennaro, P.Mirti, C.Casolino (Istituto di Chimica Analitica, Univ. di Torino, Torino, Italy). *Polyhedron (GB)*, vol.2, no.1, p.13-18 (1983).

The kinetics of the intramolecular acetate scramblings occurring in thirteen ethylenediaminetetraacetate (EDTA) complexes have been studied by analyzing the modification observed in the NMR spectra of their D₂O solutions, when temperature is changed. The experimental results indicate that the Δ, Δ conversion is a fast process on the NMR time scale for each of the complexes considered, whereas the nitrogen inversion occurs at an observable rate in the case of the Cd(II), In(III), Sc(III), Y(III) and Lu(III) chelates and is too rapid in the other complexes. Computer analysis of the experimental NMR spectra has been performed in order to obtain enthalpy, entropy and free energy of activation concerning the N inversion of the cited chelates. Twist and bond breaking mechanisms are discussed with reference to both scrambling processes. (34 refs.)

60750 The rotational and hyperfine spectrum and structure of $\text{H}_2\text{CO}\cdot\text{HF}$. F.A. Baiocchi, W. Klemperer (Dept. of Chem., Harvard Univ., Cambridge, MA, USA).

J. Chem. Phys. (USA), vol. 78, no. 6, pt. 2, p.3509-20 (15 March 1983).

The rotational spectrum of the hydrogen bonded complex formed between hydrogen fluoride and formaldehyde has been obtained from 3 to 35000 MHz using molecular beam electric resonance spectroscopy. The molecule is found to be a prolate slightly asymmetric rotor with $\kappa = -0.98$ and an inertial defect of $\Delta = 0.62 \text{ amu } \text{\AA}^2$. The rotational constants determine that the average geometry of the three heavy atoms is bent with an O-F distance of 2.66 Å and a C-O-F angle of 109.5°. The large value of μ_a shows that HF is hydrogen bonded to the oxygen. The average orientation of the HF axis with respect to the inertial axes is obtained from the two components (S_a and S_b) of the direct nuclear spin-spin hyperfine coupling tensor. Both the hyperfine data and the value of μ_b indicate a nonlinear hydrogen bond in this species. Finally, the observation of hyperfine splittings in the spectrum attributable to the presence of the triplet spin state of formaldehyde provides experimental information regarding the tunneling of the formaldehyde protons. The spectra are consistent with a rigid planar structure. Some of the spectroscopic and average structural constants are summarized: $A - \Delta = 50543.205(23) \text{ MHz}$; $B = 4832.232(33) \text{ MHz}$; $C = 4386.621(33) \text{ MHz}$; $\mu_a = 3.7535(2) \text{ D}$; $\mu_b = 1.399(1) \text{ D}$; $S_a^{\text{HF}} = 93.6(8) \text{ kHz}$; $S_b^{\text{HF}} = -31.7(11) \text{ kHz}$; $r_{\text{O-F}} = 1.794 \text{ Å}$; $r_{\text{O-C}} = 2.659 \text{ Å}$; $\angle \text{C-O-F} = 109.5^\circ$; $\angle \text{C-O-H} = 115^\circ$. (33 refs.)

60751 Possible P, T-odd effects in NMR spectroscopy of molecules. V.L. Varentsov, V.G. Gorshkov, V.F. Ezhov, M.G. Kozlov, L.N. Labzovskii, V.N. Migichev (B.P. Konstantinov Inst. of Nuclear Phys., Acad. of Sci., USSR).

JETP Lett. (USA), vol. 36, no. 5, p.175-8 (5 Sept. 1982). Translation of: *Pisma v Zh. Eksp. i Teor. Fiz. (USSR)*, vol. 36, no. 5, p.141-4 (5 Sept. 1982). [received: April 1983]

The methods of NMR spectroscopy might be useful for an experimental search of P- and T-odd effects in molecules. The accuracy of such measurements is estimated. The existing upper limit on the electric dipole moment of the proton might be reduced by two orders of magnitude by taking this approach. (4 refs.)

60752 NMR spin-echo spectra of molecules containing four spin-1/2 nuclei with an AA'BB' symmetry in liquid-crystalline samples. A.G. Avent, J.W. Emsley, D.L. Turner (Dept. of Chem., Univ. of Southampton, Southampton, England).

J. Magn. Resonance (USA), vol. 52, no. 1, p.57-70 (March 1983).

A series of model compounds in which an AA'BB' system is coupled to increasingly complex groups of heteronuclei is used to demonstrate that accurate values for homonuclear dipolar coupling constants may easily be extracted from their spin-echo spectra. This is an important step in the analysis of complex spectra from solutes in liquid-crystalline solvents and provides an alternative to spin decoupling in studies of partially deuterated liquid crystals. (11 refs.)

60753 Reexamination of a sequence designed to cancel ^{13}C signals of protonated carbons. M.R. Bendall, D.T. Pegg (School of Sci., Griffith Univ., Nathan, Queensland, Australia).

J. Magn. Resonance (USA), vol. 52, no. 1, p.136-8 (March 1983).

Recently, Rutar (ibid., vol. 48, p.155, 1982) described a two-step spin-echo pulse sequence, sequence [A], which was designed to eliminate efficiently the ^{13}C signals of all protonated carbons: $\tau_{1/2}[\text{C}] - 1/4\pi[\text{H}] - 1/4\pi[\text{decouple for } 1/2\tau_{1/2}] - \pi[\text{C}] - 1/2\tau_{1/2}$ acquire ^{13}C , decouple ^1H . [A]. This sequence combined the simple one-step proton flip and gated decoupler methods. Consequently, it was expected to be more accurate than the one-step methods in canceling protonated carbon signals when the single-bond $^{13}\text{C}\cdot^1\text{H}$ J values diverge from the values used in setting the sequence delay times, because both steps were expected to reduce these signals. This expectation was supported by experimental evidence using a sample of *s*-butyl benzene. The mechanism of this sequence, and indeed any spin-echo sequence, is examined experimentally and theoretically by removing the π refocusing pulses. (10 refs.)

60754 Bismuth NMR spectroscopy: ^{209}Bi and ^{19}F high-resolution NMR spectra of the hexafluorobismuthate(V) ion. K. Morgan, B.G. Sayer, J. Schrobilgen (Dept. of Chem., McMaster Univ., Hamilton, Ontario, Canada).

J. Magn. Resonance (USA), vol. 52, no. 1, p.139-42 (March 1983).

Bismuth-209 (natural abundance, 100%) is among the more sensitive NMR nuclei, possessing a sensitivity relative to the proton of 0.136, but due to quadrupolar relaxation effects the only solution studies of a ^{209}Bi resonance have been of aqueous solutions of $\text{Bi}(\text{NO}_3)_3$ which gave broad resonances ($\Delta\nu = 3200 \text{ Hz}$). There also have been a number of solid-state ^{209}Bi NMR studies concerned with measuring Knight shifts. Only in the case of polycrystalline KBiF_6 have the effects of spin-spin coupling been observed. Spin-spin coupling between ^{209}Bi and ^{19}F , which was masked by magnetic dipole-dipole interactions, was derived from a lineshape analysis of the ^{19}F NMR spectrum which yielded $|J_{209\text{Bi}-19\text{F}}| = 2700 \pm 300 \text{ Hz}$. The authors present a high-resolution solution study of ^{209}Bi in BiF_6^- . The latter, like its group V congeners PF_6^- , AsF_6^- , and SbF_6^- , is octahedral. Although ^{209}Bi possesses a considerable quadrupole moment ($Q = 0.4 \times 10^{-28} \text{ m}^2$), the effect of quadrupole line broadening is diminished by the large size of the spin for ^{209}Bi ($I = 9/2$) and octahedral symmetry. (12 refs.)

60755 Spin trapping of $\cdot\text{NO}_2$ radicals produced by UV photolysis of RDX, HMX and nitroguanidine. M.D. Pace, B.S. Holmes (Naval Res. Lab., Washington, DC, USA).

J. Magn. Resonance (USA), vol. 52, no. 1, p.143-6 (March 1983).

In a recent study, evidence was reported of $\cdot\text{NO}_2$ free-radical formation in single crystals of RDX (Pace et al. 1982). The $\cdot\text{NO}_2$ free radicals were produced in the RDX single crystals by UV photolysis at 77K, but the EPR signal decayed when the single crystals were warmed to room temperature. Similar observations have been reported for $\cdot\text{NO}_2$ free radicals which are trapped in a frozen matrix. Such evidence suggests that UV photolysis of the nitramines nitroguanidine [NQ : $(\text{H}_2\text{N})_2\text{C}(\text{NO}_2)_2$], RDX [$\text{C}_3\text{H}_6\text{N}_6\text{O}_6$], and HMX [$\text{C}_4\text{H}_8\text{N}_8\text{O}_8$] can produce free radicals which rapidly decay before being detected by CW EPR spectroscopy. The authors have employed the spin-trapping capacity of DMSO and DMSO- d_6 to indirect $\cdot\text{NO}_2$ free radicals which are generated from MQ, RDX, and HMX by UV radiation at room temperature. (7 refs.)

60756 Excited states of mixed-ligand chelate complexes of ruthenium(II). A re-examination of the evidence for strong interligand coupling. J.E. Baggott, G.K. Gregory, M.J. Pilling, S. Anderson, K.R. Seddon, J.E. Turp (Oxford Univ., Oxford, England).

J. Chem. Soc. Faraday Trans. II (GB), vol. 79, pt. 2, p.195-210 (Feb. 1983).

It has been shown that the evidence produced by G.A. Crosby and W.M. Elfring (1976) to argue for the presence of strong interligand coupling is ambiguous, and that there is an alternative interpretation of their data. In contrast with their observations, the present authors find that the low-field ^1H NMR spectra of $[\text{Ru}(\text{bipy})_2(\text{phen})]^{2+}$ and $[\text{Ru}(\text{bipy})(\text{phen})_2]^{2+}$ reveal no significant correlation between chemical shift and ligand composition, and thus

provide no evidence for strong interligand interactions. The development of a kinetic model for the coupling between electronic states has led to the demonstration that the excited state decay characteristics of mixed-ligand complexes of ruthenium(II) are consistent with strong kinetic coupling and that such behaviour can be obtained when measurable spectroscopic shifts are absent. Finally, the electronic absorption spectra provide some evidence for localised $\pi \rightarrow \pi^*$ excited states. (30 refs.)

60757 Multi-dimensional spectroscopy. II. Analysis of 3D lineshapes obtained from stochastic NMR of two level systems. B. Blumich (Iwan N. Stranski Inst., Tech. Univ. Berlin, Berlin, Germany).

Mol. Phys. (GB), vol. 48, no. 5, p.969-80 (10 April 1983).

For pt. I see ibid., vol. 48, no. 5, p.955-68 (1983). Three-dimensional lineshapes which are observed in non-linear stochastic NMR spectroscopy are analysed in terms of 1D and 2D cross-sections. Two important results are obtained: (1) A 1D sub-diagonal cross-section, which is similar to a conventional CW or FT NMR spectrum, can exhibit a narrower line-shape than obtained in 1D FT-spectroscopy. (2) The relaxation times T_1 and T_2 can be determined from the lineshapes of selected cross-sections, independent of magnetic field inhomogeneity. (11 refs.)

60758 On the twist-boat conformation of the tetrahydropyran cycle in the trioxa-bis-spiroketal series. M.F. Grenier-Loustalot, F. Métras (Lab. de Chimie Organique Phys., Inst. Univ. de Recherche Sci., Pau, France), L. Cottier, G. Descotes.

Spectrosc. Lett. (USA), vol. 15, no. 12, p.963-7 (1982).

The authors studied the molecules by PMR and ^{13}C NMR at 500 MHz. Coupling constants are analysed and the twist-boat conformation confirmed. (4 refs.)

60759 Effects of electron transfer on the chemical polarization of nuclei in the recombination of radical-ion pair in strong magnetic fields. K.M. Salikhov, F.S. Sarvarov (Inst. of Chem. Kinetics & Combustion, Acad. of Sci., Novosibirsk, USSR).

Theor. & Exp. Chem. (USA), vol. 18, no. 2, p.124-32 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol. 18, no. 2, p.146-55 (March-April 1982). [received: Feb. 1983]

The authors show how electron transfer substantially alters the CNP effect (chemical nuclear polarization) for all nuclei in the radical anions and cations. The effects of electron transfer on CNP can be interpreted as due to reduction in the role of hyperfine interactions in the radical anion in the singlet-triplet evolution of the radical-ion pairs. (8 refs.)

60760 Structure of the binuclear 3,7-dimethylene-bicyclo[3.3.1]nonane-silver nitrate-Eu(fod)₃ complex by PMR spectroscopy. P.A. Krasutskii, A.G. Yurchenko, M. Jones, M.Yu. Kornilov, L.S. Degtyarev, V.I. Zamkovo (Kiev Polytech. Inst., Kiev State Univ., Kiev, Ukrainian SSR).

Theor. & Exp. Chem. (USA), vol. 18, no. 2, p.162-5 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol. 18, no. 2, p.189-93 (March-April 1982). [received: Feb. 1983] (13 refs.)

60761 Use of luminescence spectra of adducts of europium β -diketonates with methyl-substituted pyridines in interpreting NMR data obtained by the use of lanthanide shift reagents. V.F. Zolin, L.G. Koreneva, A.E. Obukhov, V.P. Zvolinskii, I.R. Kordova (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR).

Theor. & Exp. Chem. (USA), vol. 18, no. 2, p.166-72 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol. 18, no. 2, p.193-200 (March-April 1982). [received: Feb. 1983] (28 refs.)

33.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

60762 Electron spin resonance spectroscopic evidence for steric enhancement of resonance. K. Ganapathy, T. Balasubramanian, K. Pandiarajan (Dept. of Chem., Annamalai Univ., Annamalaiagar, India).

Curr. Sci. (India), vol. 51, no. 23, p.1114-15 (5 Dec. 1982).

ESR spectral data on radical anions obtained by the electrolytic reduction of the aromatic nitro compounds in acetonitrile are used to substantiate the phenomenon of steric enhancement observed previously (V. Baliah and M. Uma, 1960). (11 refs.)

60763 ESR of pseudorotating ^6Li and ^7Li . D.A. Garland, D.M. Lindsay (Dept. of Chem., City Univ. of New York, New York, NY, USA).

J. Chem. Phys. (USA), vol. 78, no. 6, pt. 1, p.2813-16 (15 March 1983).

ESR spectra assigned to pseudorotating ^6Li and ^7Li molecules have been produced by arc lamp photolysis of argon matrices doped with isotopically enriched ^6Li or ^7Li . The spectrum of ^6Li consists of seven equally spaced first derivative transitions with relative intensities in good agreement with the expected values for three equivalent $I = 1$ nuclei. The measured HF constant

and g value are $\bar{A}=12.2(1)$ G and $g_0=2.00282(1)$. The absence of a stationary trimer spectrum suggests that the ground vibronic state of Li_3 is relatively nonlocalized. The average isotropic spin population of trimer $\bar{p}=0.225$ is in excellent agreement with the predictions of ab initio calculations. The total isotropic spin population $3\bar{p}\approx 0.68$ suggests an approximately 30% p -character for the unpaired electro wave function. A comparison of the orbital composition of M , M_2 , M_3 , M_∞ ($\text{M}=\text{Li}$, Na , K) shows (i) a diminishing s -character with increasing cluster size, (ii) a remarkable similarity between Na and K for all cluster sizes, and (iii) a smaller s -character (greater hybridization) for Li clusters. (25 refs.)

60764 High-spin molecules: electron spin resonance of manganese halides and sulfide at 4 K. C.A.Baumann, R.J.van Zee, W.Weltner, Jr. (Dept. of Chem., Univ. of Florida, Gainesville, FL, USA). *J. Phys. Chem. (USA)*, vol.86, no.26, p.5084-93 (23 Dec. 1982).

The zero-field splittings (D), ^{55}Mn hyperfine (h) interaction constants, and g values have been measured, where possible, for the MnCl_2 , MnBr_2 , MnI_2 , and MnS molecules having ^6S ground states and for the $^7\Sigma$ molecules MnCl , MnBr , and MnI . Among the heavier dihalides, $|D|$ increases from 0.44 to >2 cm^{-1} down the series, the ^{55}Mn and halogen h s are within the line widths (<50 G), agreeing with the decreasing ionicity. Among the heavier monohalides, $|D|$ increases from 0.07 to >0.5 cm^{-1} down the series, but observed ^{55}Mn h s, unexpectedly, do not show a monotonic variation from MnF to MnI . MnS has $|D|>2$ cm^{-1} , but much smaller ^{55}Mn h s than MnO , indicating considerably more covalency in the heavier molecule. (55 refs.)

60765 Electron spin resonance investigation of sulphur-33 and nitrogen-15 substituted dithiazol-2-yl and dithiazolidin-2-yl free radicals. S.A.Fairhurst, R.S.Pilkington, L.H.Sutcliffe (Donnan Chem. Labs., Univ. of Liverpool, Liverpool, England).

J. Chem. Soc. Faraday Trans. 1 (GB), vol.79, pt.4, p.925-40 (April 1983). Thermal cyclo-addition reactions of tetrasulphur dinitride with certain alkenes generate a new series of stable free radicals possessing the 1,3,2-dithiazolyl ring. The radicals have simple ESR spectra and are potentially useful spin probes or labels. The sharpness of the spectral lines has enabled the authors to observe natural abundance lines from nitrogen-15, sulphur-33 and carbon-13. The presence of two equivalent sulphur atoms in the heterocyclic ring has been demonstrated by isotopic double labelling with nitrogen-15 and sulphur-33. An isotopic triple labelling experiment with the latter two isotopes and with deuterium was carried out with the related 1,3,2-dithiazolidinyl radicals. Temperature coefficients of coupling constants were measured for both classes of radicals and INDO calculations showed that nitrogen out-of-plane wagging is responsible for all the temperature coefficients. Molecular orbital calculations were performed for the 1,3,2-dithiazolyl and 1,3,2-dithiazolidinyl structures using semi-empirical INDO and ab initio Gaussian 76 computer programs: the optimised structural parameters from both calculations are in good agreement. The INDO calculations gave signs and magnitudes of isotropic coupling constants in overall agreement with those observed experimentally. (35 refs.)

60766 Electron spin resonance spectra and structure of the α,α -difluoroethyl radical. A.Hasegawa, T.Wakabayashi, M.Hayashi (Dept. of Chem., Hiroshima Univ., Hiroshima, Japan), M.C.R.Symons.

J. Chem. Soc. Faraday Trans. 1 (GB), vol.79, pt.4, p.941-51 (April 1983). Exposure of solid $\text{CH}_3\text{CF}_2\text{Cl}$ and solid solutions of $\text{CH}_3\text{CF}_2\text{Cl}$ in some organic solvents to ^{60}Co γ -rays at 77K gives anisotropic ESR spectra of CH_3CF_2 radicals. Using the spectra it has been shown that the internal rotation of the CH_3 group is greatly hindered at 77K and that the hyperfine splitting of only one of the hydrogens in the CH_3 group is observed, reflecting a dihedral angle of 0° between the C-H bond and the half-filled orbital at the C_α atom. The anisotropic spectra are in excellent agreement with a simulation spectrum which was made for a pyramidal structure very similar to that optimized by INDO calculations. On annealing of the irradiated solid $\text{CH}_3\text{CF}_2\text{Cl}$ the spectrum of the CH_3CF_2 radical changed irreversibly at ca. 100K, indicating the presence of a high-temperature form of the CH_3CF_2 radical. The ESR spectrum for the high-temperature species has been satisfactorily interpreted on the assumption that the radical is undergoing libration about the axis passing through the mid-point of the two F atoms and that of the two C atoms of the pyramidal CH_3CF_2 radical. (15 refs.)

60767 ESR spectra and spin densities of the radical anions of magnesium and zinc azaporphyrates. K.Dzilin'ski, G.N.Sinyakov (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.2, p.196-201 (March-April 1982). Translation of: *Teor. & Ekspr. Khim. (USSR)*, vol.18, no.2, p.227-33 (March-April 1982). [received: Feb. 1983]

The authors give the results of quantum-chemistry calculations of the distribution of spin density in the radical anions of the zinc and magnesium complexes of monoazetioporphyrin II, of monoazetioporphyrin IV, and of diazetioporphyrin II. On the basis of the results of the calculation the complex partially resolved ESR spectra of these compounds are modeled. (28 refs.)

Electron spin resonance spectra of tetrafluoroethylene radical cation See Entry 63568

33.35 DOUBLE RESONANCES AND OTHER MULTIPLE RESONANCES

60768 Rydberg-Rydberg transitions of NO using an optical-optical double resonance multiphoton ionization technique. Wan Yee Cheung, W.A.Chupka, S.D.Colson, D.Gauyacq (Sterling Chem. Lab., Yale Univ., New Haven, CT, USA), P.Avoiris, J.J.Wynne.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3625-34 (15 March 1983). New Rydberg-Rydberg transitions of $^{14}\text{N}^{16}\text{O}$ have been observed by the technique of optical-optical double resonance multiphoton ionization (OODR-MPI). The analysis of $S^2\Sigma^+ \leftarrow A^2\Sigma^+$ (0, 0), (1, 1) and $4f \leftarrow A^2\Sigma^+$ (1, 1) bands are reported. Molecular constants of the $S^2\Sigma^+ \nu=0$, 1 levels are in good agreement with those derived from absorption data. The structure of the $4f(\nu=1)$ level of the $^{14}\text{N}^{16}\text{O}$ isotope can be fully investigated for the first time since the OODR-MPI spectrum is free from any overlap, in contrast to the corresponding absorption spectral region. No detectable spectral perturbation was observed for levels up to $N=10$, although the non-Rydberg $G^2\Sigma^+$ ($\nu=8$) level lies at the same energy as the $4f(\nu=1)$ level. The $4f(\nu=1)$ rotational levels are described by an intermediate case (b)/case (d) coupling scheme and present a similar pattern to that of the $4f(\nu=0)$ rotational levels previously studied from absorption data. Rotational constants $B_1=1.968$ cm^{-1} and $\alpha_1=0.020$ cm^{-1} have been derived from the analysis and the B_0 value already known from absorption work. The constant k , which is related to the quadrupole moment of the vibrating molecular core, has also been derived for the $4f(\nu=1)$ level. The authors' observations suggest the presence of a 'significant' amount of $l=2$ character in the lowest member of the ns series ($3\sigma\sigma$)

$A^2\Sigma^+$ state, and confirm the pure $l=3$ character of the $4f$ Rydberg level. (21 refs.)

60769 Rydberg states of $^7\text{Li}_2$ by pulsed optical-optical double resonance spectroscopy: molecular constants of $^7\text{Li}_2^+$. R.A.Bernheim, L.P.Gold, T.Tipton (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3635-46 (15 March 1983).

Three Rydberg series of electronic states of $^7\text{Li}_2$ have been characterized by pulsed optical-optical double resonance spectroscopy. The observed Rydberg states, which include the previously reported $E^2\Sigma_g^+$ and $G^2\Pi_u$ states, have been identified as $3-10\sigma^+ \Sigma_g^+$, $3-10\sigma^+ \Sigma_g^+$, and $3-15\sigma^+ \Pi_g$. The molecular constants for several of the upper members of each of the above series have been used to deduce the ionization potential of $^7\text{Li}_2$ and molecular constants for the $X^2\Sigma_g^+$ state of $^7\text{Li}_2^+$. The former was determined to be $T_0(\infty)=41496 \pm 4$ cm^{-1} . The latter were found to be in good agreement with recent ab initio calculations. (36 refs.)

60770 State-selective spectroscopy in a molecular nitrogen discharge by use of optogalvanic double-resonance spectroscopy. K.Miyazaki, H.Schein-graber, C.R.Vidal (Max-Planck-Inst. fur Extraterrestrische Phys., Garching, München, Germany). *Phys. Rev. Lett. (USA)*, vol.50, no.14, p.1046-9 (4 April 1983).

Transitions between excited states of molecular nitrogen, which are generated in a hollow-cathode discharge, have been studied by use of optogalvanic double-resonance spectroscopy as a state-selective method. By pumping of the known (0,0) band of the $c_4^+ \Pi_u \leftarrow a_1^+ \Sigma_g^+$ system in N_2 , the (16,0) and (17,0) bands of the $b_1^+ \Sigma_g^+ \leftarrow a_1^+ \Sigma_g^+$ system have been identified for the first time, and the recent assignment for the (0,0) band of the $c_5^+ \Sigma_u^+ \leftarrow a_1^+ \Sigma_g^+$ system has been verified. 33.35H MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)

60771 Sublevel decay kinetics of the triplet state of bacteriochlorophyll a and b in methyltetrahydrofuran at 1.2K. H.J.Den Blanken, A.J.Hoff (Bio-phys. Dept., Huygens Lab., State Univ. Leyden, Leyden, Netherlands). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.343-17 (8 April 1983).

The decay rates of the triplet sublevels of monomeric BChl a and b have been reexamined with pulsed microwave excitation. The values of k_2 and k_3 are significantly higher than published values. The new results are discussed in relation to the exciton model of the special pair making up the primary electron donor in photosynthetic purple bacteria. (25 refs.)

60772 Microwave studies of collision-induced transitions between rotational levels. VIII. Collisions between NH_3 and polar molecules. A.R.Fabris, T.Oka (Herzberg Inst. of Astrophys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3462-6 (15 March 1983). The technique of four-level microwave double resonance has been applied to the study of rotation-inversion transitions of NH_3 induced by collisions with various polar molecules. H_2O , D_2O , CH_3OH , CH_3X and CH_3X_2 ($\text{X}=\text{F}$, Cl , Br , I), NO , CO , and OCS were used as collision partners. The values of $\nu=\Delta I/I$ observed for many four-level systems which are connected by dipole-type transitions ($\Delta J=\pm 1$, $\Delta K=0$, parity $+$ or $-$) are given and qualitatively explained taking into account the long-range dipole-dipole interaction and the pattern of rotational energy levels of the collision partners. (26 refs.)

60773 A microwave double resonance study of collision-induced transitions between the M components of a rotational transition of OCS . H.Bomdsdorf, H.Mader (Abteilung Chem. Phys., Inst. fur Phys. Chem., Univ. Kiel, Kiel, Germany).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3467-75 (15 March 1983). Four-level MW-MW double resonance experiments on the rotational Stark levels $M=0$ and $M=\pm 1$ of the $\text{OCS } J=1-2$ transition have been performed to investigate collision-induced population transfer due to OCS self-collisions. A MW bridge has been used as a filter in order to discriminate between the pump and signal radiation and the relative change of signal line intensity η has been determined for both M components by means of a double modulation technique. A two-level Bloch-type description of the signal transition is given to estimate additional effects of the off-resonant pump radiation in the absence of collisions. (20 refs.)

33.40 MÖSSBAUER SPECTRA

60774 Mossbauer studies of FeSn molecules isolated in rare-gas solids and SCF-X α -scattered-wave molecular-orbital analyses of Sn_2 and FeSn diatomic molecules. H.M.Nagarathna, P.A.Montano (Dept. of Phys., West Virginia Univ., Morgantown, WV, USA).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.2, p.271-82 (Feb. 1983). Iron-tin molecules were isolated in rare-gas solids and studied using both ^{57}Fe and ^{119}Sn Mossbauer isotopes. Experiments at very dilute concentrations were performed to detect FeSn diatomic molecules. Larger clusters were identified by concentration dependence studies and Monte Carlo calculations. The ^{57}Fe and ^{119}Sn isomer shifts (IS) for FeSn diatomic molecules suggest a covalent bonding between Fe and Sn atoms. Similar behaviour was observed for large iron-tin clusters (Fe_xSn_y , $x,y\geq 3$). SCF-X α -SW calculations were performed for Sn_2 and FeSn diatomic molecules. Sn_2 shows a $^3\Sigma_g$ ground state and gives a quadrupole splitting consistent with the experimentally measured value at an equilibrium distance of 2.75 Å. (23 refs.)

33.45 MAGNETO-OPTICAL AND ELECTRO-OPTICAL SPECTRA; DICHROISM

60775 Time-resolved study of the laser optogalvanic effect in I_2 . D.A.Haner (Chem. Dept., California Polytech. State Univ., Pomona, CA, USA), C.R.Webster, P.H.Flamant, I.S.McDermid.

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.302-6 (8 April 1983). A time-resolved study of the optogalvanic effect in a pure iodine discharge is reported for pulsed dye laser irradiation at 585 nm. By varying both the spatial location and pulse energy of the laser probe, several contributions to

the time evolution of the optogalvanic signal are identified and their origin discussed. (21 refs.)

60776 The study of enantioselectivity in copper complexes with some 1,3-dicarbonyl ligands by circular dichroism spectroscopy. A.A.Kurganov, L.Ya.Zhuchkova, V.A.Davankov (Nesmeyanov Inst. of Organo-Element Compounds, Acad. of Sci., Moscow, USSR). *Polyhedron (GB)*, vol.2, no.1, p.37-41 (1983). The circular dichroism spectra of copper(II) complexes with hydroxymethylene camphor, hydroxymethylene menthone, and trifluoroacetyl camphor as well as of mixed-ligand complexes with acetylacetone have been studied in different solvents at different temperatures. The changes observed in the spectra are attributed to a strong coordination of the solvent molecules in axial positions of square-planar complexes. It has been shown that the contributions of two ligands to the net spectrum of circular dichroism are additive and that the absorption spectra of the complexes do not depend on the optical configuration of the ligands. The conclusion has been drawn that no noticeable inter-ligand interactions exist in the complexes and no enantioselective effects are exhibited. (14 refs.)

60777 Calculation of the electrooptical parameters and the absolute intensities of the IR bands of the water molecule and its isotopically substituted derivatives. S.P.Gavva, E.N.Bolitina, L.M.Sverdlov, M.D.Elkin. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.29-31 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.31-4 (July 1982). [received: April 1983]

The electrooptical parameters of water, $\partial\mu_{OH}/\partial q_1$, $\partial\mu_{OH}/\partial q_2$, and $\partial\mu_{OH}/\partial \gamma$, have been determined from the experimental values of the absolute intensities of the IR bands of the H₂O molecule within the framework of valence-optical theory. These parameters have been used to calculate the derivatives of the dipole moment with respect to the normal coordinates, and the absolute intensities of the molecules D₂O, T₂O, HOD, HOT, and DOT. The signs of $\partial P_{\alpha}/\partial Q_i$ were selected using the results of a quantum-mechanical calculation. The quantum-mechanical calculation of the dipole moment P of the H₂O molecule and the derivatives of the dipole moment with respect to the normal coordinates were carried out by the CNDO/2 method. The results of the calculations show satisfactory agreement with experiment. (15 refs.)

60778 Temperature-dependent electrooptical Kerr effect in spherical-top molecules. I.Ya.Ogurtsov, V.L.Ostrovskii, I.B.Bersuker. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.210-11 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.356-8 (Aug. 1982). [received: April 1983]

It is shown that in the case of molecules with T_d or O_h symmetry, the electronic state of which is degenerate, there is a significant temperature-dependent contribution to the electrooptical Kerr constant that is analogous to the contribution due to the Langevin mechanism for anisotropic molecules. The Kerr effect can serve as a means of investigating the anisotropic polarizability of spherical tops in orbitally degenerate states. Consideration of the Jahn-Teller effect, which is significant when there is electron degeneracy, leads to a complication of the temperature dependence of the Kerr constant but does not change its order of magnitude. (8 refs.)

33.45B Zeeman and Stark effects

60779 Electric dipole moment of the diatomic TlF in its higher vibrational states. K.P.R.Nair, J.Hoef (Inst. für Molekülphys., Freie Univ. Berlin, Berlin, Germany).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.348-51 (8 April 1983). The electric dipole moment of $^{205}\text{Tl}^{19}\text{F}$ has been measured in its higher vibrational states up to $v=7$ by studying the Stark effect in the $J=0 \rightarrow 1$ rotational transitions. The variation of the electric dipole moment with vibrational states is discussed. The electric dipole moment can be written as $|\mu_v| = 4.1941(15) + 0.0681(12)(v + 1/2)\text{D}$. (8 refs.)

60780 Electric dipole moments of excited vibrational levels in the $\tilde{X}1_A$ state of formaldehyde by stimulated emission spectroscopy. P.H.Vaccaro, J.L.Kinsey, R.W.Field, Hai-Lung Dai (Dept. of Chem., MIT, Cambridge, MA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3659-64 (15 March 1983). The electric dipole moments of the 4_4 ($E_{44} = 4628.4\text{ cm}^{-1}$), 2_4 , $2_{4,2}$ ($E_{2,2} = 5770\text{ cm}^{-1}$), and $2_{4,4}$ ($E_{2,2} = 6347\text{ cm}^{-1}$) levels of H₂CO are measured as 2.2723(86), 2.3222(47), and 2.2825(33) D, respectively. This first combination of stimulated emission pumping (SEP) with a static electric field demonstrates the possibility of systematically measuring dipole moments for highly excited vibrational levels of polyatomic molecules in their electronic ground states. The present dipole moment measurements and all previous ones involving overtones and combinations of the C-O stretch (ν_2) and out-of-plane bend (ν_4) are reduced to two types of expansions. The dipole moment μ is expressed both as an expansion in the normal coordinate displacements and as an expansion through squared terms in the ν_2 and ν_4 vibrational quantum numbers. (21 refs.)

33.45C Magnetic circular dichroism

60781 Some theoretical considerations for magnetic vibrational circular dichroism spectra. L.Laux, V.Pultz, C.Marcotti, J.Overend, A.Moscowitz (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.4096-102 (15 March 1983). Expressions are derived for the A terms, B terms, and associated partial anisotropy factors relevant for the magnetic vibrational circular dichroism (MVCD) spectra of molecules with nondegenerated ground states. These expressions are derived subject to the approximations of the harmonic fixed partial charge model and the condition of magnetic coupling among only the ground electronic state vibrational levels. Numerical values for partial anisotropy factors calculated from these expressions, when taken in conjunction with the recent MVCD data of Keiderling (1981), suggest the importance of magnetic coupling of the ground electronic state with higher electronic states in the case of B terms. Symmetry constraints on the nonvanishing of such coupling terms also suggest the possible utility of MVCD data for processing spectroscopic and molecular structural information. (11 refs.)

33.50 FLUORESCENCE, PHOSPHORESCENCE; RADIATIONLESS TRANSITIONS (INTERSYSTEM CROSSING, INTERNAL CONVERSION)

60782 Laser-saturated fluorescence measurements of OH concentration in flames. R.P.Lucht, D.W.Sweeney, N.M.Laurendeau (Flame Res. Lab., School of Mech. Engrg., Purdue Univ., West Lafayette, IN, USA).

Combust. & Flame (USA), vol.50, no.2, p.189-205 (March 1983). A laser-saturated fluorescence technique which can be used to measure accurate OH radical concentrations over wide ranges of flame pressure, composition, and temperature has been developed. The balanced cross-rate model is used to analyze the fluorescence data. The basic premise of the model is that the population of the upper and lower rotational levels which are coupled by the laser is approximately constant during the laser pulse. Using the balanced cross-rate model to calculate concentrations, OH number densities calculated from saturated fluorescence agree to within 20% with number densities calculated from independent absorption measurements over a wide range of flame conditions. In addition, the ratio of number densities calculated from saturated fluorescence and absorption is constant over an order of magnitude range of flame pressure, demonstrating the insensitivity of the saturated fluorescence signal to collisional quenching rates. The estimated OH detection limit of the fluorescence system is 10^{12} - 10^{13} molecules/cm³. (47 refs.)

60783 pH correlation of the absorption, fluorescence and polarization spectra of fluorescein isothiocyanate. D.P.Dimitrov (Res. Lab., Bulgarian Acad. of Sci., Sofia, Bulgaria).

C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.11, p.1467-70 (1982). In the present study the influence of H⁺ concentration on the absorption, fluorescence and polarization spectra of free and protein-bound FITC was investigated. The results will help in the interpretation of the induced structural transition in proteins using the fluorescence probe method. A stock solution of fluorescein isothiocyanate was prepared in acetone and diluted till the necessary concentration in the phosphate buffer. The absorption and fluorescence spectra was measured by Perkin Elmer 450 UV spectrophotometer with fluorescence attachment. The investigations of fluorescence polarization were carried out with spectropolarimeter constructed according to Weber's scheme. (12 refs.)

60784 Singlet excited-state 'energy hopping' in alkylbenzenes. H.Morrison, G.Pandey (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.126-8 (25 March 1983). The quenching of toluene fluorescence by cis-6-phenyl-2-hexene has been studied to determine the rate of single 'energy hopping' in dilute solutions of alkylbenzenes. The singlet lifetime data have been analyzed by the Stern-Volmer method to give the quasi-isoenergetic rate, k_{10} , as $1.2 \times 10^{10}\text{ M}^{-1}\text{ s}^{-1}$. This result is consistent with an excimer formation-dissociation mechanism for alkylaromatic singlet energy transfer in dilute solution. (12 refs.)

60785 Reactive and non-reactive quenching of O(¹D₂) by COF₂. P.H.Wine, A.R.Ravishankara (Engrg. Experiment Station, Georgia Inst. of Technol., Atlanta, GA, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.129-31 (25 March 1983). Quenching of O(¹D₂) by COF₂ has been investigated by time-resolved resonance fluorescence monitoring of the product O(³P₂) following 248 nm pulsed laser photolysis of O₃. The rate constant for total removal of O(¹D₂) by COF₂ is $(7.4 \pm 1.2) \times 10^{-11}\text{ cm}^3\text{ molecule}^{-1}\text{ s}^{-1}$, $71 \pm 7\%$ of the quenching interactions result in formation of O(³P₂). (8 refs.)

60786 Effect of anion coordination upon radiationless transitions of the uranyl ion. G.C.Joshi, G.C.Dangwal (Dept. of Phys., Garhwal Univ., Srinagar, India), D.D.Pant, H.B.Tripathi.

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.167-70 (1 April 1983). At 80K, where the deactivation processes in uranyl luminescence in solutions are temperature independent, the radiationless transition rate depends upon the presence of H₂O in the first coordination sphere of the uranyl ion, UO₂²⁺. It is found that such radiationless transitions are due to a photophysical intramolecular process. (12 refs.)

60787 Excited-state relaxation in 1-amino-8-naphthalene sulphonate. J.Drew, P.Thistlethwaite, G.Woolfe (Phys. Chem. Dept., Melbourne Univ., Parkville, Victoria, Australia).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.296-301 (8 April 1983). Fluorescence quantum yields and lifetimes have been measured for the isomeric species, 1-amino-8-naphthalene sulphonate and 2-amino-1-naphthalene sulphonate, in a range of solvents. The former shows a change in both radiative and nonradiative rate with solvent, while in the latter, the radiative rate is constant. The results suggest that, for 1-amino-naphthalene sulphonate, relaxation from the Franck-Condon state involves an increase in charge-transfer character. (15 refs.)

60788 Lifetimes in the B²Π_{1/2} state and the heat of formation of NCO. B.J.Sullivan, G.P.Smith, D.R.Crosley (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.307-10 (8 April 1983). Using laser-induced fluorescence in a low-pressure flow system, the lifetimes of the 00⁰ and 10⁰ vibrational levels of the B²Π_{1/2} state of NCO have been measured. The results, 63 and $\leq 10\text{ ns}$ respectively, indicate that the dissociation limit to N(²D) + CO lies between these levels. This corresponds to a dissociation energy $D_0^{\circ} \geq 1.68\text{ eV}$ and an enthalpy of formation $\Delta H_{298}^{\circ} \geq 48\text{ kcal/mole}$ for NCO, and $\Delta H_{298}^{\circ}(\text{HNC}) \geq -14\text{ kcal/mole}$. (15 refs.)

60789 Laser spectroscopic investigation of the X²Σ_{1/2} state of the van der Waals molecule NaAr. G.Aepfelbach, A.Nunemann, D.Zimmermann (Inst. für Strahlungs- und Kernphys., Tech. Univ. Berlin, Berlin, Germany).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.311-15 (8 April 1983). The laser-excitation spectrum of the transition X²Σ⁺ ← A²Π of NaAr has been investigated using a supersonic expansion of a mixture of sodium vapor and argon gas for production of the molecules. In comparison to previous investigations the rotational constants of the vibrational levels $v''=2$, 3 and 4 of the X²Σ⁺ state could in addition be determined. From the results the authors deduce a value of $R_e = 5.008(5) \times 10^{-10}\text{ m}$ for the equilibrium internuclear distance and of $D_e = 41.7(8)\text{ cm}^{-1}$ for the well depth of the X²Σ⁺ state. (24 refs.)

60790 Effects of aggregation on the phosphorescence of phenyl alkyl ketones in 77K rigid glass solutions. T.Wismontski-Knitel, T.Kilp (Radiation Lab., Univ. of Notre Dame, Notre Dame, IN, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.352-6 (8 April 1983). The concentration dependence of the 77K phosphorescence of propiophenone and acetophenone in methylcyclohexane and isopentane glasses implies extensive solute aggregation, arising from partial phase separation. Rationales for the observation of multiple emissions that are based on matrix rigidity dependent rates of conformational relaxation of the triplet state should be viewed with a great deal of caution when aliphatic hydrocarbon glasses are used. (17 refs.)

60791 Solvent effect on 1O_2 yield and the mechanism of polycyclic hydrocarbon triplet-state quenching by oxygen. A.P.Darmanyan (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.383-9 (8 April 1983). The yield of singlet oxygen (1O_2) in quenching of the triplets of 1,2,5,6-dibenzanthracene, 1,2-benzanthracene, anthracene, pyranthrene and duroquinone by oxygen has been studied using the laser photolysis technique. It was found that in toluene $\Phi(^1O_2) = 1.0 \pm 0.1$ and the quenching occurs via the energy transfer mechanism on account of an exchange interaction in the encounter complex. In benzonitrile the charge transfer contributes to a significant extent, leading to a considerable decrease in $\Phi(^1O_2)$. (26 refs.)

60792 Nickel porphyrin photophysics and photochemistry. A picosecond investigation of ligand binding and release in the excited state. D.Kim, C.Kirmaier, D.Holten (Dept. of Chem., Washington Univ., St. Louis, MO, USA).

Chem. Phys. (Netherlands), vol.75, no.3, p.305-22 (15 March 1983). The photophysical behaviour and some photochemical processes for nickel (II) porphyrins have been examined with picosecond transient absorption techniques. Detailed results are reported for Ni-octaethylporphyrin (NiOEP) and Ni-protoporphyrin IX dimethyl ether (NiPPDME) in toluene, pyridine and piperidine. Excitation flashes at six wavelengths between 355 and 532 nm have been employed. In toluene, rapid (≤ 15 ps) radiationless decay occurs via several pathways to the low-lying $^3B_{1g}$ excited state. In the basic solvents pyridine and piperidine, excited states with nickel $^1A_{1g}$ (d_2) character have a tendency to release ligands bound to the metal. Excited states with nickel $^3B_{1g}$ ($d(z^2)$, $d(x^2-y^2)$) character on the other hand, have an affinity for basic ligands, which rapidly bind to the metal. The competition between radiationless decay, ligand binding, and ligand release depends on the nickel porphyrin, solvent, and excitation wavelength. A set of 'rules' has been developed that gives a consistent view of all our results and those of previous investigators. These results may be helpful in understanding photoprocesses in other transition-metal porphyrins, including hemes, which have particular biological significance. (33 refs.)

60793 Fluorescence quenching of tertiary amines by halocarbons. P.C.Alford, C.G.Cureton, R.A.Lampert, D.Phillips (Davy-Faraday Lab., Royal Instn., London, England).

Chem. Phys. (Netherlands), vol.76, no.1, p.103-9 (1 April 1983). The quenching of fluorescence of a variety of tertiary amines by halocarbons has been investigated in both vapour and solution phases. In the vapour phase, quenching cross sections do not correlate well with a parameter based upon well-depth for collision complexes, but reasonable correlation between rate constant and free energy change for charge-transfer complex formation is obtained. The quenching by halocarbons is very efficient. In solution phase, evidence of static quenching is presented. (30 refs.)

60794 Measurement of sub-nanosecond single-rovibronic fluorescence with a pulsed dye laser. T.Suzuki, K.Yamada, T.Kasuya (Inst. of Phys. & Chem. Res., Saitama, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.522-6 (March 1983). A method of fluorescence-decay measurement of sub-nanosecond time-resolution is presented which employs a narrow band pulsed dye laser for molecular excitation and a computer-controlled waveform digitizer for decay-data recording. The kinematical parameters of single rovibronic molecular relaxation are thereby deduced routinely from the observed time-evolution of fluorescence decay through a curve-fitting procedure of convolution-integral treatment. A specimen observation of fluorescing dye solution demonstrates the capability of determining fluorescence decay time as short as 0.2 ns with a precision of better than ± 0.05 ns. The method was applied to a systematic single rovibronic observation of fluorescence from the predisociative state of an interhalogen molecule.

60795 Circular polarization in the fluorescence of β,γ -enones: distortion in the $^1n\pi^*$ state. P.H.Schippers, J.P.M.van der Ploeg, H.P.J.M.Dekkers (Dept. of Theoretical Organic Chem., Univ. of Leiden, Leiden, Netherlands).

J. Am. Chem. Soc. (USA), vol.105, no.1, p.84-9 (12 Jan. 1983). The circular dichroism (CD) and the circular polarization of the luminescence (CPL) in the $n\pi^*$ transition were measured for a series of five rigid β,γ -unsaturated ketones: (1S,3R)-4-methyleneadamantan-2-one (1), (1S,3R)-4-adamantylidenediamantan-2-one (1a), (1R,4R)-bicyclo[2.2.1]hept-5-en-2-one (2), (1R)-7-methylenebicyclo[2.2.1]heptan-2-one (3), and (1S)-2-methylenebicyclo[2.2.1]heptan-7-one (4). All compounds exhibit marked differences between the degree of circular polarization in absorption and in fluorescence, giving evidence of important changes in molecular geometry upon excitation. The nature of these distortions is tentatively analyzed by using the previously found quantitative chirality rule for β,γ -enones (preceding paper in this issue). In the $n\pi^*$ state of β,γ -enones, the carbonyl group no longer is planar but is pyramidal due to an out-of-plane displacement of the oxygen atom (local symmetry C_1 instead of C_{2v}). The out-of-plane angle is large, and its direction is such that the oxygen approaches the double bond, pointing to a bonding interaction in the excited state, which is briefly discussed. (47 refs.)

60796 Circular polarization of luminescence as a probe for intramolecular $n\pi^*$ energy transfer in meso-diketones. P.H.Schippers, H.P.J.M.Dekkers (Gorlaeus Labs., Univ. of Leiden, Leiden, Netherlands).

J. Am. Chem. Soc. (USA), vol.105, no.1, p.145-6 (12 Jan. 1983). When a racemic mixture is excited with circularly polarized light, the degree of circular polarization in the luminescence (CPL) provides information on the rate of racemization in the excited state. It appears, however, that the CPL technique can also be used to study intramolecular excitation energy transfer. The authors report measurements on aliphatic diketones that contain two remove carbonyl chromophores of opposite chirality and thus are, in the ground state, meso structures (RS). In the $n\pi^*$ state they may occur in two enantiomeric forms, R^*S and RS^* , provided the excitation energy remains localized at a carbonyl group. (18 refs.)

60797 Radiative decay rates from deperturbed $V=0-7$ vibrational levels of CO A $^1\Pi$ measured using synchrotron radiation. R.W.Field, O.B.d'Azy, M.Lavollee, R.L.Delgado, A.Trainer (LURE, Univ. Paris-Sud, Orsay, France).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.2838-46 (15 March 1983). Fluorescence decay times from single vibronic levels and from restricted groups of rotational levels are measured for CO A $^1\Pi$ under selective excitation by synchrotron radiation. The largest cause of variation of decay curves with v' and J' quantum numbers is singlet-triplet perturbations. These perturbations cause measured, rotationally averaged decay rates to differ from the deperturbed, pure A $^1\Pi$ decay rate by up to 20%. Failure to take perturbation effects into account could systematically affect transition moment functions derived from radiative lifetimes, but not those from absorption oscillator strengths or fluorescence branching ratios. The dependence of the CO A $^1\Pi-X^1\Sigma^+$ transition moment on internuclear distance is evaluated from deperturbed lifetimes of A $^1\Pi$ $v=0-7$ vibrational levels and found, assuming linear R_e vs \bar{r} variation within the region $1.0 \leq \bar{r}_{v,v'} \leq 1.6$ Å, to be

$R_e(\bar{r}_{v,v'}) = [7.48_{-0.34}^{+0.34}] [1 - (0.683_{-0.008}^{+0.006}) \bar{r}_{v,v'}] D$, where $R_e(\bar{r}_{v,v'})$ is the r centroid and the correlated uncertainties cited correspond to three standard deviations. However, the occurrence of strong A-X fluorescence bands with r centroids near 1.46 Å implies a decidedly nonlinear form for $R_e(\bar{r})$. Since the $v=0-7$ A $^1\Pi$ lifetimes sample $R_e(\bar{r})$ very weakly at $\bar{r} > 1.3$ Å, the transition moment function derived here is valid only for $1.0 \leq \bar{r} \leq 1.3$ Å. The $R_e(\bar{r})$ function determined here is nearly identical to that derived by Mumma et al. [ibid., vol.54, p.2627 (1971)] from the radiative lifetimes measured by Hesser [ibid., vol.48, p.2518 (1968)]. This is a coincidence, not evidence that perturbation effects are inconsequential. (28 refs.)

60798 Observation of the asymmetric O-U-O stretch in the vibronic absorption spectrum of uranyl formate monohydrate. W.P.West, C.H.Muller, III, J.T.Porter, II (GA Technol. Inc., San Diego, CA, USA), M.M.Malley.

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3338-9 (15 March 1983). The visible and near UV absorption spectra of uranyl compounds at cryogenic temperatures are characterized by regular progressions of narrow lines. The vibronic structure is built principally on the symmetric stretching mode of the uranyl ion. The authors report the first observation of unusual vibronic absorption in isotopically labeled uranyl formate monohydrate, $UO_2(HCOO)_2 \cdot H_2O$ at 4.2 K. They have established that the asymmetric O-U-O mode is vibronically active in this compound and further that its frequency is lower than that of the symmetric mode, i.e. the order is reversed from that previously observed and expected assuming a simple valence bond model. By adding a bond interaction term to the usual valence bond model the authors are able to fit the stretch frequencies and find excellent agreement between the observed and predicted uranium and oxygen isotope shifts. (4 refs.)

60799 The effect of solvent environment on molecular electronic transition moment directions: symmetry lowering in pyrene. F.W.Langkilde, E.W.Thulstrup, J.Michi (Dept. of Chem., Aarhus Univ., Aarhus, Denmark).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3372-81 (15 March 1983). Measurements of polarized fluorescence and phosphorescence of pyrene, 2-fluoropyrene, and 2-methylpyrene in 3-methylpentane glass at 77 K reveal significant differences among the three molecules. These are interpreted in terms of solvent-induced mixing of the L_a and L_b states. It is proposed that such symmetry-lowering effects of the solvent environment may well be important contributors to the often observed discrepancies between the theoretical limiting values of polarization ratios and the values actually observed. (41 refs.)

60800 Spectroscopy of large molecular complexes in supersonic jets. U.Even, J.Jortner (Dept. of Chem., Tel Aviv Univ., Tel Aviv, Israel).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3445-54 (15 March 1983). In the paper the authors report the results of an experimental study of laser-induced fluorescence spectroscopy of MX_n van der Waals complexes, consisting of medium-sized molecules (X =methane, carbon tetrachloride, ammonia, water, methanol, acetonitrile, benzene, and toluene) bound to a large aromatic molecule (M =tetracene and fluorene). These large complexes were synthesized in pulsed supersonic jets of He seeded with M and X . The spectral features assigned to $S_0 \rightarrow S_1$ electronic-vibrational excitations of these large MX_n complexes, which are characterized by narrow linewidths (FWHM) of $2-4$ cm^{-1} , were attributed to three distinct categories: (i) A vibrationless excitation of MX_n , (ii) vibrational excitations of M in MX_n , and (iii) excitations of the vibrations involving relative motion of M and X in the MX_n complex. (20 refs.)

60801 Laser vaporization of jets: spectra and ground state molecular parameters of Sn_2 . V.E.Bondybe, M.Heaven, T.A.Miller (Bell Labs., Murray Hill, NJ, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3593-8 (15 March 1983). Sn_2 molecules are produced by YAG laser vaporization of tin metal in a stream of cold helium gas and studied by time resolved induced fluorescence. Several vibronic bands of an electronic transition with origin near 18200 cm^{-1} are analyzed and the ground state vibrational frequency and equilibrium molecular constants are determined. The electronic structure of Sn_2 is discussed and an assignment of the observed transition proposed. (28 refs.)

60802 First observation of bound-continuum transitions in the laser-induced $X^1\Sigma^+ \rightarrow X^1\Sigma_g^+$ fluorescence of Na_2 . K.K.Verma, J.T.Bahns, A.R.Rajaei-Rizi, W.C.Stwalley (Dept. of Chem. & Phys., Univ. of Iowa, Iowa City, IA, USA), W.T.Zemke.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3599-613 (15 March 1983). The authors report an interesting spectrum of Na_2 excited by a Kr^+ (5682 Å) laser which shows a long series of R-P doublets in the region 5600-8000 Å and a continuum with three very broad maxima beyond 8000 Å. The spectral analysis reveals that the laser populates the $v'=34$, $J'=50$ level in the $A^1\Sigma^+$ state from where Na_2 molecules fluoresce not only to the bound vibrational levels of the entire ground state potential well ($3 \leq v'' \leq 56$) but also to the continuum levels above the well. The authors have made an independent theoretical quantitative prediction of the continuous emission and the agreement between experiment and theory is found to be excellent. Almost the entire (99.6%) ground state RKR potential is constructed using the bound state experimental data which leads to a more accurate value of the dissociation energy ($D_0'' = 6024 \pm 6$ cm^{-1}). The feasibility of a continuously tunable near infrared Na_2 laser based upon this radiative dissociation process is discussed. Finally, they present a comprehensive bibliography for the Na_2 molecule similar to that given by Hessel and Vidal for Li_2 [ibid., vol.70, p.4439 (1979)]. (329 refs.)

60803 Observation of levels near dissociation in the $X^1\Sigma^+$ state of 7Li_2 . K.K.Verma, M.E.Koch, W.C.Stwalley (Depts. of Chem. & Phys., Univ. of Iowa, Iowa City, IA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3614-22 (15 March 1983). The fluorescence spectrum of 7Li_2 excited by a Kr^+ (5682 Å) laser has been observed and analyzed. The laser simultaneously excites the $A^1\Sigma^+$ and the $B^1\Pi_u$ states of the 7Li_2 molecule. The analysis reveals two very interesting things: (a) the A-X spectrum consists of the transitions involving v' levels of the entire ground state potential well ($5 \leq v'' \leq 36$) and thus the authors have made the very first observation of the levels near the dissociation limit in the ground state of 7Li_2 , which suggests that $D_0'' = 8521.5 \pm 4$ cm^{-1} ; and (b) the B-X spectrum is actually enhanced by the fluorescence from the A state which is an interesting single frequency analog of 'modulated population spectroscopy' or 'optical-optical double resonance' which the authors call 'coupled laser induced fluorescence series' (CLIFS). (17 refs.)

60804 Two-photon excitation of the $D^1\Delta-X^1\Sigma^+$ transition in carbon monoxide. C.Kittrell, S.Cameron, L.Butler, R.W.Field (Dept. of Chem., MIT, Cambridge, MA, USA), R.F.Barrow.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3623-5 (15 March 1983). A frequency doubled pulsed dye laser is used to promote two-photon excitation of the $D^1\Delta-X^1\Sigma^+$ transition in carbon monoxide. Collisional transfer to $A^1\Pi$ leads to ultraviolet fluorescence which is detected with a solar blind photomultiplier. Rotationally resolved structure belonging to bands of three isotopically substituted molecules has been measured relative to the visible

spectrum of iodine. Preliminary values of molecular constants are given. (13 refs.)

60805 High-resolution gas phase emission and laser induced fluorescence excitation spectra of $1,3,5\text{-C}_6\text{F}_3\text{H}_3^+$ and $1,3,5\text{-C}_6\text{F}_3\text{D}_3^+$: critical bands in the Jahn-Teller effect analysis. C.Cossart-Magos, D.Cossart, S.Leach (Lab. de Photophys. Moléculaire du CNRS, Univ. Paris-Sud, Orsay, France), J.P.Maier, L.Misev.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3673-87 (15 March 1983). Cooled gas phase laser induced fluorescence excitation (LIFEX) spectra of $1,3,5\text{-C}_6\text{F}_3\text{H}_3^+$ (h_3^+) and $1,3,5\text{-C}_6\text{F}_3\text{D}_3^+$ (d_3^+) ions were obtained between 4600 and 4110 Å at a resolution of 1 cm^{-1} . Band intensities were corrected for laser power variations. Gas phase discharge emission spectra of the same ions were photographed at a resolution of 0.25 cm^{-1} from 4450 to 4800 Å and at 0.1 cm^{-1} between 4500 and 4700 Å. In emission, only the spectra region $\lambda < 4580\text{ Å}$, corresponding to the O_0^+ band and bands to lower wavelengths, is reported here. Particular regions of the LIFEX spectra were also recorded at a resolution of 0.25 cm^{-1} . Vibronic analysis of the $B^2A_2^- \rightarrow X^2E^+$ transition is made on the basis of five (seven) e' , three a_1' , and one a_2' excited state fundamental frequencies which were assigned in the h_3^+ (d_3^+) ions. A few low-lying ground state levels, among which the first $j=3/2$ (A_1, A_2) levels of mode 6 (e'), the most active Jahn-Teller (JT) mode, are particularly critical. Some discrepancies in band relative intensities and absolute wave numbers are found between the h_3^+ LIFEX spectrum obtained here and that previously published by Bondybey et al. (1979). Nevertheless, interpretation of the authors h_3^+ and d_3^+ spectra is more consistent with the high values of JT parameters derived by Bondybey, et al. (1980), rather than the low values obtained in earlier work by Cossart-Magos and Leach (1980). Some differences between observed and calculated JT features are rationalized in terms of model inadequacies. (28 refs.)

60806 Luminescence of the excited mercury diethylamine complex. Attachment by ligand exchange. A.B.Calleary, C.P.Devonport (Phys. Chem. Dept., Univ. of Cambridge, Cambridge, England).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3738-46 (15 March 1983). The possibility of molecular attachment to excited atoms in gases by ligand exchange has been examined. It was first confirmed that mixtures of mercury vapor and diethylamine Et_2NH give negligible luminescence when subject to irradiation with the 2537 Å mercury resonance line. The emission was then examined from mercury vapor with added amine up to 100 Torr, in the presence of an excess NH_3 . With NH_3 alone, a strong emission was observed due to HgNH_3^+ , a complex of $\text{Hg}(\text{P}_0)$ and NH_3 , with $\lambda_{\text{max}} \sim 3500\text{ Å}$. The addition of Et_2NH gave rise to a second band to the long wavelength, extending throughout the visible region, with $\lambda_{\text{max}} \sim 5140\text{ Å}$; the ratio of the intensity of the long wavelength member to the residual emission in the 3500 Å region was found to be proportional to the amine pressure. For various $[\text{Et}_2\text{NH}]$ and fixed $[\text{NH}_3]$, the set of normalized spectral profiles are isosbestic, corresponding to the superposition of just two basic functions. From the cw experiments, it was added that the addition of quite small pressures of Et_2NH , $\sim 1\text{ Torr}$, to NH_3 at 1 atm pressure effectively extinguishes the HgNH_3^+ luminescence by a fast ligand exchange reaction $\text{HgNH}_3^+ + \text{Et}_2\text{NH} \rightarrow \text{Hg}(\text{Et}_2\text{NH})^+ + \text{NH}_3$. The two basic functions which comprise the spectra are due to $\text{Hg}(\text{Et}_2\text{NH})^+$ and the dimer $\text{Hg}(\text{Et}_2\text{NH})_2^+$, which is the carrier of the long wavelength component. This scheme was confirmed using the resonance flash technique to time resolve the exchange of ligands; the rate coefficient is $\sim 2 \times 10^{-10}\text{ cm}^3\text{ molecule}^{-1}\text{ s}^{-1}$ for the above reaction. The radiative lifetime of the $\text{Hg}(\text{Et}_2\text{NH})^+$ monomer is $1.15\text{ }\mu\text{s}$. The large red shift and broadening associated with attachment of the second ligand arises because the emission is from an upper state which belongs to the $\text{Hg}(\text{P}_1)$ asymptote, and which is more strongly bound than the state which correlates with $\text{Hg}(\text{P}_0)$. (16 refs.)

60807 IR laser induced loss of fluorescence in $\text{UO}_2(\text{hfacac})_2\text{TMP}$. I. Real time detection of multiple photon excitation of the ground electronic state. R.B.Hall (Corporate Res. Sci. Lab., Exxon Res. & Engng. Co., Linden, NJ, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3792-805 (15 March 1983). The infrared multiple photon excitation and unimolecular reaction of $\text{UO}_2(\text{hfacac})_2\text{TMP}$ is monitored in real time by the loss of dye laser induced fluorescence (LIF) intensity. The loss of fluorescence results from a change in the chemical structure and not from a change in the vibrational state population of the ground or excited electronic state. Absorption into the emitting states also becomes forbidden following IR excitation. The observed rates of fluorescence depletion are greater than 10^6 s^{-1} with excitation the rate limiting step over the range of laser intensities studied. At low extents of depletion the observed rate follows the single photon absorption rate. At higher yields, the observed rate is within a factor of 2 of the rate derived from the measured dependence of the yield on laser power using the analysis given by Quack (1980). Such an analysis can provide a reasonable estimate of the reaction rate when no rate measurements can be made. The ensemble dynamics contribute significantly to the observed kinetics. The excitation and reaction behavior is characteristic of molecules in the quasicontinuum excitation regime from the absorption of the first photon. No fluence or power threshold for reaction is observed. At a fixed fluence, the yield remains constant over a change in the peak power of more than an order of magnitude and thus appears to be independent of the rate at which the photons are absorbed. In addition, the absorption profile is homogeneous with respect to reaction; the yield remains proportional to the product of fluence times the small signal absorption cross section for any laser transition within the $\nu=0$ to $\nu=1$ absorption profile of any of the accessible vibrational modes. Collision cross sections for fluorescence quenching by $\text{UO}_2(\text{hfacac})_2\text{TMP}$ and by the products of the multiple photon excitation $\text{UO}_2(\text{hfacac})$ and TMP are also obtained. (31 refs.)

60808 Vibrational relaxation of HCN(002). P.W.Hastings, M.K.Osborn, C.M.Sadowski, I.W.M.Smith (Dept. of Phys. Chem., Univ. Chem. Labs., Cambridge, England).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3893-8 (15 March 1983). Tuned output from an optical parametric oscillator has been used to excite HCN to its (002) level for measurements of vibrational energy transfer. By observing time-resolved (002,001) fluorescence in the presence of different collision partners, the following rate constants ($k_{002}/\text{cm}^3\text{ molecule}^{-1}\text{ s}^{-1}$) was obtained for relaxation of HCN(002) at $298 \pm 4\text{ K}$: $k(\text{HCN}) = (6.8 \pm 0.4) \times 10^{-12}$, $k(\text{He}) = (5.6 \pm 0.25) \times 10^{-13}$, $k(\text{Ne}) = (3.8 \pm 0.16) \times 10^{-15}$, $k(\text{Ar}) = (3.0 \pm 0.4) \times 10^{-15}$, $k(\text{O}_2) = (1.39 \pm 0.08) \times 10^{-14}$, $k(\text{N}_2) = (2.6 \pm 0.15) \times 10^{-14}$, $k(\text{CO}) = (6.8 \pm 0.4) \times 10^{-14}$. These results are compared with the rate constants (k_{001}) obtained for relaxation of HCN(001) and the mechanisms for relaxation are discussed. With noble gases as collision partners, the ratios (k_{002}/k_{001}) are less than one. Comparison of these ratios with predictions of the 'breathing sphere' theory indicates that relaxation HCN(00₂) \rightarrow 1,2 occurs via transfer to HCN ($12^0_{12} \nu_3 - 1$), the lower rate for $\nu_3 = 2$ being due to the increased energy gap between initial and final states. (28 refs.)

60809 Intramolecular vibrational relaxation from C-H stretch fundamentals. G.M.Stewart, J.D.McDonald (School of Chem. Sci., Univ. of Illinois, Urbana, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3907-15 (15 March 1983). Infrared fluorescence measurements have been used to determine the presence or absence of intramolecular vibrational relaxation (or more precisely state mixing) from an excited C-H stretch in 23 representative molecules varying in size from methane to nonbornene. Included are aliphatic hydrocarbons, aromatic molecules, ethers, and ketones, including a cyclic molecule. The rate of resonance fluorescence, calculated relative to a nonrelaxing molecule, was used as the criterion of relaxation. Small rates imply state mixing and hence in the large molecule limit, relaxation. The primary correlation with the presence of mixing is with state density; about ten states per wave number (cm^{-1}) are needed to insure mixing. The spread in threshold densities reflects variations in anharmonicity. For some molecules true relaxed (non C-H stretch) fluorescence is observed. These experiments were done in a molecular beam, using a pulsed optical parametric oscillator for excitation and a circular variable filter for spectral resolution. (52 refs.)

60810 The collisional flow of vibrational energy into surrounding vibrational fields within S_1 benzene. K.Y.Tang (SRI Internat., Menlo Park, CA, USA), C.S.Parmenter.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3922-34 (15 March 1983). Vapor phase fluorescence spectra are used to determine the absolute rate constants for the collisional transfer of vibrational energy from initial single vibronic levels of S_1 benzene into the surrounding S_1 vibronic field. 11 initial levels are probed with vibrational energies ranging to 2368 cm^{-1} where the level density is about 10 per cm^{-1} . CO, isopentane, and S_0 benzene are the collision partners. Benzene rate constants are three to four times gas kinetic for all levels, and electronic energy switching between the initial S_1 molecule and the S_0 collision partner probably makes important contributions. Isopentane efficiencies range from one to two times gas kinetic. Most of the transfer from low S_1 levels occurs within excitation of vibrational energy within isopentane. These V-V contributions decline to only about 10% for the high transfer. CO-induced transfer by V-T,R processes for all levels. The CO efficiency rises from about 0.1 for low regions to about unity for levels above 1500 cm^{-1} . The CO efficiencies retain significant sensitivity to initial level identity even in the higher regions. Propensity rules derived from collisional mode-to-mode transfer among lower levels of S_1 benzene are used to calculate the relative CO efficiencies. The calculated efficiencies agree well enough with the data to suggest that it may be meaningful to model vibrational equilibration with the use of propensity rules. The rules suggest that only a small number of levels among the thousands surrounding a high initial level contribute significantly to the total relaxation cross section and that this number is rather independent of the level density. While CO and isopentane have comparable efficiencies for relaxation of a high S_1 level, CO is much less efficient for inducing full thermal equilibration. CO, which uses V-T,R processes only, becomes a relatively poor transfer partner once low levels are reached during the equilibration, whereas V-V transfer sustains isopentane's large efficiency for all levels. (22 refs.)

60811 Laser induced fluorescence excitation spectrum of jet-cooled benzoic acid dimers. D.E.Poelzl, J.K.McVey (Dept. of Chem., Princeton Univ., NJ, USA).

J. Chem. Phys. (USA), vol.78, no.7, p.4349-55 (1 April 1983). Inter-molecular hydrogen bonding in gas phase dimers of benzoic acid is investigated following preparation in a pulsed free-jet expansion. Laser induced fluorescence excitation spectra are analyzed to provide information regarding the vibrational assignments of the 1^1L_b excited state. In agreement with studies in low temperature mixed crystals, the electronic excitation is essentially localized on one monomer unit in the dimer. A 58 cm^{-1} band is associated with the ν_3 hydrogen bonding stretch+bend mode and is prominent in combination bands involving internal motion in the carboxyl groups. The free jet technique has been shown to be particularly advantageous in studies of inter-molecular hydrogen bonding. (13 refs.)

60812 Fluctuations of cross sections in chemical processes: infrared photoquenching of fluorescent states in thiophosgene. J.R.Grover, D.M.Brenner (Dept. of Chem., Brookhaven Nat. Lab., Upton, NY, USA).

J. Chem. Phys. (USA), vol.78, no.7, p.4385-99 (1 April 1983). Pronounced fluctuations have been observed in the cross section for the quenching of the fluorescence of the different members of the vibrational manifold belonging to the 4^1A_2 state of thiophosgene. This phenomenon is reminiscent of fluctuations that occur for nuclear reactions in regions of high level density, and that can be interpreted in terms of reduced transition amplitudes that are approximately normally distributed. The analysis of the fluctuations gives an effective number of independent reaction channels; in general, the greater the number of channels, the narrower is the range of the fluctuations. A knowledge of the number of independently contributing channels can be useful in the interpretation of experimental results, and sometimes lends important insight into reaction processes. The quenching cross sections for thiophosgene were therefore examined to see whether an analysis of their fluctuations would be useful. It was found necessary to develop a form of analysis that circumvents a serious obstacle in the chemical data, namely, the existence of significant correlations among the cross sections. The resulting formalism is quite simple to apply however, and, after suitable generalization, should be widely applicable to chemical experiments in which resolved cross sections that exhibit fluctuations are measured. Application of this formalism to the thiophosgene quenching cross sections shows that two hypotheses of the quenching mechanism must be rejected, but provides no reason to reject a third, that quenching is via absorption by states in a 'bottleneck' region that is reached by rapid photon transitions from the fluorescent target states, which transitions cannot be statistically distributed. The analysis also reveals the existence of an important, experimentally determined constraint that must still be accounted for by any successful hypothesis, viz. the number of channels increases approximately as the square root of the peak power of the quenching infrared radiation. (15 refs.)

60813 Rotational effects in the intermediate-case radiationless decay of pyrimidine. D.M.Bartels, K.G.Spears (Dept. of Chem., Northwestern Univ., Evanston, IL, USA).

J. Phys. Chem. (USA), vol.86, no.26, p.5180-91 (23 Dec. 1982). The rotational contour dependence of pyrimidine fluorescence decay has been investigated under collision-free conditions in a supersonic nozzle expansion. Lifetimes for the long component of the intermediate-case biexponential decay were measured with a pulsed dye laser of 0.6-cm^{-1} resolution and a boxcar integrator detection method. Measurements were obtained at 0.25-cm^{-1} intervals across the 0-0 and $6b_2$ vibronic band contours at a number of different rotational temperatures. The data have both an excitation frequency and a temperature dependence. (45 refs.)

60814 Effects of excited-state prototropic equilibria on the fluorescence energies of benzimidazole and thiazobenzimidazole homologues. P.C.Tway, L.J.Cline Love (Dept. of Chem., Seton Hall Univ., South Orange, NJ, USA).

J. Phys. Chem. (USA), vol.86, no.26, p.5227-30 (23 Dec. 1982).
Excited-state prototropic equilibria are proposed to explain the appearance of new charge transfer bands in the fluorescence spectra of certain benzimidazole and thiazobenzimidazole homologues. The effects of pH on fluorescence energies and intensities, proton NMR data, low-temperature luminescence studies, and pK_a values are used to support the postulated mechanisms. The 5-amino derivatives are believed to undergo excited-state deprotonation, while the 5-hydroxy derivative forms an excited-state zwitterion. (12 refs.)

60815 Rotational relaxation in ground-state *p*-difluorobenzene: State selection by stimulated emission pumping. W.D.Lawrence, A.E.W.Knight (School of Sci., Griffith Univ., Nathan, Brisbane, Queensland, Australia).

J. Phys. Chem. (USA), vol.87, no.3, p.389-91 (3 Feb. 1983).
An estimate is obtained for the cross section for rotational relaxation from a small subset of $|J,K\rangle$ states in the S_0 vibrational level of S_0 *p*-difluorobenzene. The method of stimulated emission pumping (SEP) is used to prepare the initial $|J,K\rangle$ population. Collisional relaxation induced by the bath of *p*-difluorobenzene molecules in Boltzmann equilibrium is monitored from the intensity of wavelength-resolved single vibronic level fluorescence generated via selective excitation from the SEP-prepared levels. The average efficiency for rotational relaxation σ/σ_{HS} , relative to the hard-sphere cross section σ_{HS} , is found to be 5 ± 2 for ground-state *p*-difluorobenzene. This study demonstrates that rotational relaxation in a nonpolar polyatomic molecule in its S_0 state is as efficient as that found for similar polyatomics in their S_1 electronic states. (9 refs.)

60816 Vibrational relaxation within mixed electronic states. A.E.W.Knight (School of Sci., Griffith Univ., Nathan, Brisbane, Queensland, Australia), C.S.Parmeter.

J. Phys. Chem. (USA), vol.87, no.3, p.417-24 (3 Feb. 1983).
The efficiency of collisional vibrational relaxation within a fluorescing state of a polyatomic molecule is discussed for cases where the fluorescing state is of mixed electronic character involving both a radiative and nonradiative state. It is shown that the efficiency of vibrational relaxation should be changed from that within the pure radiative state by the factor A_1^2 , where A_1 is the fraction of radiative state character in the mixed electronic state. Severe reductions in vibrational relaxation efficiencies are predicted, and they are likely to occur in polyatomic whose fluorescence decay is consistent with the strong coupling, intermediate case of radiationless transition theory. Pyrimidine and pyrazine are proposed as examples. Analysis of pyrimidine data in particular shows that S_1 vibrational relaxation efficiencies are reduced by at least two orders of magnitude from those commonly found for relaxation within pure S_1 states. Such a reduction is consistent with the theory when the (known) mixed singlet-triplet character of the pyrimidine fluorescing state is considered. (20 refs.)

60817 Effect of polar solvents on amine quenching for *p*-fluorotoluene fluorescence. K.E.Al-Ani, M.Al-Sabti (Dept. of Chem., Coll. of Education, Univ. of Baghdad, Baghdad, Iraq).

J. Phys. Chem. (USA), vol.87, no.3, p.446-9 (3 Feb. 1983).
An increase in solvent polarity was found to cause a blue shift in the absorption spectrum of *p*-fluorotoluene. The Stern-Volmer constants for quenching of *p*-fluorotoluene fluorescence by primary, secondary, and tertiary aliphatic amines have been measured in 2-propanol, ethanol, and acetonitrile solvents. A strong correlation between the vertical ionization potential of the quenchers and $\log k_Q$ was observed. As the vertical ionization potential increases, the quenching rate constant decreases. In acetonitrile, secondary amines were shown to have a higher quenching ability than primary and tertiary amines. This may be due to the interaction of solvent with the formed encounter complex which enhances the formation of radical anions and cations, a full discussion of which is made. (17 refs.)

60818 Intracoll triplet-triplet annihilation in poly(2-vinylnaphthalene) in benzene solution. J.F.Pratt, S.E.Webber (Dept. of Chem., Univ. of Texas, Austin, TX, USA).

J. Phys. Chem. (USA), vol.87, no.3, p.449-54 (3 Feb. 1983).
The triplet state of poly(2-vinylnaphthalene) (P2VN) in benzene solution has been sensitized by the benzophenone triplet state and a naphthalenic excimer delayed fluorescence (DF) has been observed. Kinetic models have been tested against the experimental data, including the effect of the molecular weight on the time dependence of the DF. It has been concluded that a homogeneous, intracoll mechanism best fits the trend of the data. This implies that triplet migration along the P2VN chain is occurring in the solution phase. (15 refs.)

60819 Exciplex photophysics. VII. Steric effects in exciplex photophysics. S.T.Cheung, W.R.Ware (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).

J. Phys. Chem. (USA), vol.87, no.3, p.466-73 (3 Feb. 1983).
For pt.VI see *J. Am. Chem. Soc.*, vol.101, p.121 (1979). The influence of steric interference with sandwich-type exciplex formation has been investigated by using mono- and di-tert-butyl substitution of *N,N'*-dimethylaniline (DMA). Pyrene was the electron acceptor and studies were carried out with both steady-state and fluorescence lifetime technique in hexane and tetrahydrofuran (THF). All the rate constants of the classical exciplex mechanism were determined along with temperature coefficients. It was found that the most significant effect of tert-butyl substitution was a substantial decrease in the process $(AQ)^+ \rightarrow A^+ + Q$. Solvent effects, exciplex thermodynamics and activation parameters are discussed for the unsubstituted and tert-butyl-substituted systems. (41 refs.)

60820 Temperature dependence of the nonradiative relaxation process of the lowest excited singlet states of meso-substituted bromoanthracenes. M.Tanaka, I.Tanaka (Dept. of Chem., Tokyo Inst. of Technol., Tokyo, Japan), S.Tai, K.Hamanoue, M.Sumitani, K.Yoshihara.

J. Phys. Chem. (USA), vol.87, no.5, p.813-16 (3 March 1983).
Direct measurements of the temperature dependence of the fluorescence lifetimes of 9-bromoanthracene (BA) and 9,10-dibromoanthracene (DBA) have allowed the determination of the rate constant for intersystem crossing (isc) in the form $k_{isc} = A_{isc} \exp(-\Delta E/kT)$. This isc is attributed to that from the lowest excited singlet state S_1 to an adjacent higher excited triplet state T_1 . The values of ΔE , i.e. 600-710 cm^{-1} for BA and 1100 cm^{-1} for DBA, are about 300 cm^{-1} larger than those deduced from the $T_1 \rightarrow T_2$ fluorescence (TTF) measurement by Gillispie and Lim (Chem. Phys. Lett., vol.63, p.355, 1979). The values of the S_1 decay constants consistent with those of the buildup times for triplet-triplet absorptions lead to the suggestion that the T_1 lifetimes are tens of picoseconds, and this estimate gives good agreement between calculated and experimental Φ_{TTF} of DBA. (24 refs.)

60821 Fluorescence branching ratios from the $A^{2+}(\nu'=0)$ state of NO. T.J.McGee, G.E.Miller (NASA, Goddard Space Flight Center, Greenbelt, MD, USA), J.Burris, Jr., T.J.McIlraith.

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.4, p.333-8 (April 1983).

The emission spectrum of NO from several rotational levels in the first excited state has been recorded. Branching ratios have been measured and Franck-Condon factors calculated from the experimental data. Lifetimes of the lines used have been measured and Einstein A-values calculated. (9 refs.)

60822 Electronic quenching of pyrene $^1B_{1u}$ by olefins in the vapour phase. A.Davis, M.J.Pilling (Phys. Chem. Lab., Univ. of Oxford, Oxford, England).

J. Chem. Soc. Faraday Trans. 1 (GB), vol.79, no.1, p.235-44 (Jan. 1983).
The rate of quenching of electronically excited singlet pyrene by olefins has been investigated in the vapour phase over the temperature range 420-570K. Rate constants and activation energies have been determined and correlations with ionization potentials of the quenchers suggest an exciplex intermediate. A model previously proposed for concentration quenching of pyrene has been applied to investigate the temperature and pressure dependence of the rate constant and of the Arrhenius pre-exponential factor. (24 refs.)

60823 Annihilation-delayed fluorescence of eosin and rhodamine 6G and polyvinyl alcohol films. N.Kh.Ibraev, G.A.Ketsle, L.V.Levshin, Yu.A.Soinikov, V.I.Yuzhakov.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.521-5 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.750-5 (May 1982). [received: Feb. 1983]

Presents the results of a study of energy transfer in polymer films of polyvinyl alcohol (PVA), not containing aromatic nuclei. Eosin and rhodamine 6G molecules were used as energy acceptors. Since double bonds are absent in PVA macromolecules, it should be expected that the polymer will absorb radiation in the UV region ($\lambda \leq 190 \text{ nm}$) of the spectrum. At the same time, it is unlikely that with photoexcitation of PVA in the absorption band it will reveal luminescence. However, the investigations showed that with pulsed irradiation of a polymer film through a UFS-2 light filter ($\lambda_{\text{max}} = 335 \text{ nm}$) in the region $\lambda_{\text{max}} = 460 \text{ nm}$, there arises a wide structureless span of long-lived luminescence, which could be associated with its phosphorescence. This conclusion is based on the results of investigations of energy transfer between polymers and dye molecules. When the temperature of the PVA film is decreased to 77K, the intensity of its phosphorescence increases on the average by a factor of 2, while the rate constant for quenching luminescence decreases from 4.6×10^4 to $1.8 \times 10^4 \text{ sec}^{-1}$. It is interesting that the intensity of the luminescence of the film also depends on its thickness. (11 refs.)

60824 Participation of molecular singlet oxygen in process of accelerated fading of dye mixtures. I.M.Byetev, O.L.Golomb, G.P.Gurinovich, V.V.Karpov.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.540-5 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.770-6 (May 1982). [received: Feb. 1983]

It has been established that accelerated fading is more severe when oxygen is present, and research on the kinetics of the processes in solutions with quenching agents indicates that single-excited molecular oxygen $O_2(^1\Delta_g)$ takes part in these processes. Singlet oxygen can be detected in solutions by sensitized luminescence in the 1.27 μm region, corresponding to the $\Delta_g \rightarrow ^3\Sigma_g^-$ transition in the O_2 molecule. The authors report an investigation of the O_2 luminescence sensitization capability of dyes that take part in accelerated fading, this work being further directed toward elucidation of the mechanism of this phenomenon. (17 refs.)

60825 Excitation-frequency dependence of the efficiency of directed nonradiative energy transfer in two-component solid solutions of organic compounds. N.A.Nemkovich, I.M.Gulis, V.I.Tomin.

Opt. & Spectrosc. (USA), vol.53, no.2, p.140-3 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.239-44 (Aug. 1982). [received: April 1983]

The influence of the excitation frequency on the kinetics of the luminescence spectra and the spectra of the afterglow of solid concentrated polar solutions of phthalimide derivatives has been studied experimentally and theoretically. It has been found that the low-frequency excitation of the systems studied leads to the disappearance of the displacement of the luminescence spectrum with time and the dependence of the duration of the afterglow on the frequency of recording, related to the directed nonradiative transfer of energy through monomeric molecules with nonuniformly broadened electronic levels. It has been shown that the observed regular features are determined by the specific characteristics of the migration of energy in solutions with nonuniformly broadened electronic spectra and are due to the decrease in the efficiency of the directed transfer of energy through the monomeric molecules with decrease in the frequency of the excitation. (14 refs.)

60826 Role of energy migration between monomeric molecules of rhodamine dyes in the concentration quenching of the luminescence of the solutions. S.V.Zhuravlev, L.V.Levshin, A.M.Saetskii, V.I.Yuzhakov.

Opt. & Spectrosc. (USA), vol.53, no.2, p.143-7 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.245-51 (Aug. 1982). [received: April 1983]

The concentration dependence of the relative yields, durations, and anisotropy of the luminescence of rhodamine dyes in different solvents with different degrees of association has been studied. With allowance for the influence of the diffusion of the molecules on the concentration quenching of the luminescence, it has been shown that for the systems studied, the migration of the excitation energy between monomeric molecules does not lead to quenching of the luminescence. (22 refs.)

60827 Spectral-luminescent properties of phthalimides in aqueous-miscellar solutions of sodium dodecyl sulfate. E.N.Viktorova, T.V.Veselova, M.I.Snegov, A.S.Cherkasov.

Opt. & Spectrosc. (USA), vol.53, no.2, p.148-51 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.252-7 (Aug. 1982). [received: April 1983]

The absorption-luminescence properties of a series of phthalimides in water and heavy water with the addition of a detergent (sodium dodecyl sulfate) have been studied, and the differences in properties for phthalimides with different structures have been explained. Questions related to the solubilization of the phthalimides in the detergent micelles and the influence of the basic solvent on the luminescence properties of the solubilized molecules have been discussed. (8 refs.)

60828 Picosecond studies of energy transfer of donor and acceptor dye molecules in solution. II. A concentration dependence. P.Y.Lu, Z.X.Yu, R.R.Alfano, J.I.Gersten (Phys. Dept., City Coll. of New York, New York, NY, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2100-9 (April 1983).
For pt.I see *ibid.*, vol.26, p.3610 (1982). The energy transfer between donor and acceptor molecules has been studied by steady-state and picosecond time-resolved spectroscopies in solutions with a given concentration of donor

molecules and different concentrations of acceptor molecules. The rise and decay times of the fluorescence from donor and acceptor molecules were measured. The decrease of the decay times of the donors and the rise time of the acceptors with an increase of the concentration of acceptors observed in the mixed solution indicates a faster energy-transfer rate between the donors and acceptors. Theoretically calculated fluorescence profiles and efficiencies of energy transfer are in agreement with the experimental results. (2 refs.)

60829 Cyclization dynamics of polymers. VII. Applications of the pyrene excimer technique to the internal dynamics of poly(dimethylsiloxane) chains. P.Svirskaya, J.Danheka, A.E.C.Redpath, M.A.Winnik (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada). *Polymer (GB)*, vol.24, no.3, p.319-22 (March 1983). Poly(dimethylsiloxane) (PDMS) polymers end-capped on both ends with pyrene chromophores have been synthesized. Rate constants for end-to-end cyclization (k_1) have been determined for dilute solutions of these polymers in toluene solution using a combination of fluorescence decay and steady-state fluorescence measurements. While precise values of the critical exponent for the chain length (N) dependence of (k_1) are not yet available, these results are consistent with the $N^{-3/2}$ dependence predicted by Wilemski-Fixman theory. PDMS chains cyclize somewhat more than two times faster than polystyrene chains of the same length in solvents of similar solvating power and viscosity. These results provide strong support for similar predictions made several years ago by Perico and Cuniberti (1977) who used intrinsic viscosity data to parametrize the Rouse-Zimm model for analysis of polymer cyclization dynamics. (15 refs.)

60830 Laser induced fluorescence studies of XeF(B-X). H.Helm, D.L.Huestis, D.C.Lorents (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).

Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.TuC2/1-3. Describes a method for producing and observing the time dependent decay of specific vibrational levels of the XeF(B1/2) state in order to measure the level dependent radiative lifetimes, B-C mixing rates, vibrational relaxation rates and quenching rates. (2 refs.)

60831 Quenching and formation processes of XeF and Xe₂F excimers. R.Sauerbrey, F.K.Tittel, W.Walter, W.L.Wilson, Jr. (Electrical Engng. Dept., Rice Univ., Houston, TX, USA).

Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.TuC5/1-4. Presents details of two- and three-body quenching and formation constant measurements made for electron-beam excited XeF(B,C) and Xe₂F. XeF(C) is identified as the precursor of Xe₂F. (8 refs.)

33.65 PHOTOELECTRON SPECTRA

60832 Vibrationally resolved photoelectron angular distributions for H₂. E.D.Poliakoff, J.L.Dehermer, P.M.Dehermer (Argonne Nat. Lab., Argonne, IL, USA), A.C.Parr.

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.52-6 (25 March 1983). The photoelectron asymmetry parameter, β , is reported for individual vibrational levels of H₂⁺ ($X^2\Sigma^+$) formed by photoionization of H₂($X^1\Sigma^+$) at wavelengths of 736, 584, 461 and 304 Å. At 584 Å, β exhibits a monotonic increase with vibrational quantum number (decreasing photoelectron kinetic energy) confirming the trend predicted by Itikawa (1979). (47 refs.)

60833 Kinetic energy release distributions in the fragmentation of energy-selected iodopropane ions. W.A.Brand, T.Baer (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA), C.E.Klots. *Chem. Phys. (Netherlands)*, vol.76, no.1, p.111-20 (1 April 1983). The technique of threshold photoelectron-photoion coincidence (PEPICO) has been employed to determine the average kinetic energy release and the kinetic energy release distribution (KERD) for the iodine loss from 1- and 2-

iodopropane ions as a function of the ion internal energy. The KERDs at all precursor-ion energies investigated (0-3 eV excess energy) have the shape of statistically expected distributions, 1-iodopropane ions which dissociate with an apparent 0.16 eV reverse activation barrier, are shown to isomerize at low energies prior to dissociation, to produce subsequently the 2-propyl C₃H₇⁺ structure. At high energies they may form a different C₃H₇⁺ isomer. The experimentally observed average kinetic energy releases are approximately a factor of 2 greater than expected statistically suggesting that not all vibrational modes participate in the energy disposal. The secondary dissociation of the C₃H₇⁺ isomers to C₃H₃ which is inhibited by a reverse activation barrier of ≈ 0.4 eV indicates that the 1- and 2-iodopropane ions dissociate 75% and 60%, respectively, to form the excited I(²P_{1/2}) atoms. (30 refs.)

60834 UV photoelectron spectra of some transition metal(II) acetylacetonates. S.Kitagawa (Dept. of Chem., Kinki Univ., Higashi-Osaka, Japan), I.Morishima, K.Yoshikawa.

Polyhedron (GB), vol.2, no.1, p.43-6 (1983). The He(I) photoelectron spectra of acetylacetonate (HAA) and its metal complexes, M(II)(AA)₂ (M(II)=Mn, Co, Ni, Cu and Zn), have been measured. These spectra show characteristic metal-dependence, from which the assignment is made. The order of the orbital energy level, $d\pi_2 > n_2 > n_1$, holds for all the complexes reported here. The splitting of these orbitals is found to depend on the central metal ion specifically. (12 refs.)

60835 Use of effective core potentials in perturbation corrections to the Koopmans theorem: vertical ionization potentials of Cl₂, ClN₃, and CINCO. S.R.Langhoff, R.L.Jaffe (NASA Ames Res. Center, Moffett Field, CA, USA), D.P.Chong.

Int. J. Quantum Chem. (USA), vol.23, no.3, p.875-86 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The valence-shell vertical ionization potentials of Cl₂ were calculated by perturbation corrections to the Koopmans theorem using a traditional effective core potential based on a Phillips-Kleinman derivation and an improved effective core potential obtained by Christiansen, Lee, and Pitzer (1979). Comparison of the results with an all-electron calculation demonstrated the reliability of the Christiansen-Lee-Pitzer effective core potential, which was then used to compute the vertical ionization potentials of ClN₃ and CINCO. The results shed new light in the interpretation of the photoelectron spectra of these molecules. (24 refs.)

60836 Benzaldehyde photochemistry studied with laser ionization mass and photoelectron spectroscopy. S.R.Long, J.T.Meek, P.J.Harrington, J.P.Reilly (Dept. of Chem., Indiana Univ., Bloomington, IN, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3341-3 (15 March 1983). Multiphoton ionization has been successfully employed for several years as a molecular spectroscopic tool. In two-step ionization, a molecule is first promoted to an excited electronic state from which it is subsequently ionized. If it dissociates or rearranges following the first step but before the second, the observed mass and photoelectron spectra can be affected. In the course of ionizing benzaldehyde unanticipated spectra are generated, and their description and interpretation provide the subject of this correspondence. (18 refs.)

60837 X-ray photoelectron spectroscopy of cadmium arachidate monolayers on various metal surfaces. F.C.Burns, J.D.Swalen (IBM Res. Lab., San Jose, CA, USA).

J. Phys. Chem. (USA), vol.86, no.26, p.5123-7 (23 Dec. 1982). X-ray photoelectron spectra were measured for a single cadmium arachidate (cadmium eicosonate) monolayer bonded via the carboxylate group to various metal and metal oxide surfaces. Two well-defined peaks were observed in the C 1s spectra of these systems: an intense peak due to ionizations from the CH₂ and CH₃ carbons and a less intense peak due to ionizations from CO₂ carbon. Differences between the binding energies of these two carbon peaks were found to vary with the surface to which arachidate was bonded and these differences are interpreted as arising from differences in the charge transfer between the various surfaces and the arachidate. (15 refs.)

60838 The valence-shell electronic structure and UV photoelectron spectra of the tetrahaloethylenes. A.W.Potts, I.Novak, M.L.Lyus (Dept. of Phys., King's Coll., London, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.1, p.57-62 (April 1983).

Calculations have been presented recently on the valence-shell electronic structures of C₂Cl₄ and C₂I₄, and by reference to the photoelectron spectra of these molecules valence-shell electronic configurations have been proposed. Using these results and the He(I)/II spectra of C₂Br₄ recorded by Lyus previously (1980), it is possible to test the consistency of the C₂Cl₄ and C₂I₄ assignments by drawing a correlation of photoelectron features for the group C₂Cl₄, C₂Br₄ and C₂I₄ and in this way also to establish assignments for tetrabromoethylene. (10 refs.)

60839 Core electron ionization energies and electronic structure of Ti(NO₃)₄ and Cu(NO₃)₂. P.C.Ford, A.A.MacDowell, I.H.Hillier, C.D.Garner (Dept. of Chem., Univ. of Manchester, Manchester, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.1, p.75-80 (April 1983).

Gas phase X-ray photoelectron spectra of Ti(NO₃)₄ and Cu(NO₃)₂ are reported and discussed in terms of the molecular charge distributions. No measurable splitting is observed between the 1s ionization energies of the chemically distinct oxygen atoms in either molecule. Ab initio calculations for Cu(NO₃)₂ suggest that this is due in large measure to differential orbital relaxation occurring upon core electron ionization. (20 refs.)

60840 Electronic structure and low-energy photoelectron spectra of 4,4'-disubstituted 2,2'-bipyridines. B.Dobson, I.H.Hillier, J.A.Connor, D.Moncrieff, M.J.Scanlan, C.D.Garner (Chem. Dept., Univ. of Manchester, Manchester, England).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.2, p.295-301 (Feb. 1983). The He I photoelectron spectra of 4,4'-(di-X)-2,2'-bipyridines [X=H, Cl, CH₃, N(CH₃)₂] are reported. The low-energy regions of the spectra arising from orbitals which correlate with the $a_2(\pi)$, $a_1(n_N)$ and $b_1(\pi)$ orbitals of pyridine are assigned using the results of ab initio calculations on pyridine and 2,2'-bipyridine, together with spectra of the 4-substituted pyridines. (9 refs.)

33.70 INTENSITIES AND SHAPES OF MOLECULAR SPECTRAL LINES AND BANDS

- 60841 Band absorption by the spectral lines with a super-Lorentz line shape. M.Hirono, T.Suda (Faculty of Engng., Niigata Univ., Niigata, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.4, p.1157-63 (April 1983). The equivalent width of a single line with a super-Lorentz line shape has been expressed in terms of a function $L(x, \eta)$ which reduces to the Ladenburg-Reiche function for the special case of $\eta=2$. Some values of the function $L(x, \eta)$ have been tabulated. Band absorption by the spectral lines with a super-Lorentz line shape has also been calculated from the random model with a constant distribution of line intensities. (10 refs.)
- 60842 Radiative lifetimes and transition moments in MgO . R.N.Differderfer, D.R.Yarkony, P.J.Dagdigan (Dept. of Chem., Johns Hopkins Univ., Baltimore, MD, USA). *J. Quant. Spectrosc. & Radiat. Transfer (GB)*, vol.29, no.4, p.329-31 (April 1983). An experimental and theoretical study of several transitions in the MgO molecule is reported. The radiative lifetime of the MgO $B^1\Sigma^+ v=0$ level is measured to be 32.7 ± 1.7 nsec, while that of the electronic state(s) excited by 372 nm radiation ($d^2\Delta$ and/or $f^2\Pi$) is 11.8 ± 0.5 nsec. The $B-X$ and $A-X$ transition moments are calculated using state averaged multiconfiguration self-consistent field and configuration interaction methods. With an estimate of the $B-A$ transition moment derived from an earlier calculation, the radiative lifetime of the $B^1\Sigma^+ v=0$ level is computed to be 24 nsec. A value of 0.23 msc is calculated for the lifetime of $A^1\Pi v=0$. (23 refs.)
- 60843 Measurement of the pressure broadening and shift of the $asR(0,0)$ line of the $^{15}NH_3$ ammonia v_2 band. M.O.Bulanin, Yu.M.Ladvischenko, E.B.Khodov. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.119-20 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.198-201 (Aug. 1982). [received: April 1983] One of the methods for studying the effect of pressure on the parameters of vibration-rotation line contours of molecular gases is the measurement of the absorption by the gas of laser radiation of a frequency ν_l that is close to the frequency ν_0 of the maximum of the line of interest. If the pressures are such that one can ignore Doppler broadening and does not have to consider contributions to the absorption from neighbouring lines, the parameters of the contour can be determined by approximating the dependence of the absorption coefficient $\chi(\text{cm}^{-1})$ on the gas pressure P by some model function. Utilizing the unique example of a simultaneous quasi-coincidence of the frequencies for two gas laser lines they have isolated the vibration-rotation line as $R(0,0)$ of the fundamental band of the $^{15}NH_3$ molecule's v_2 vibration. (12 refs.)
- 60844 Effect of foreign gases on IR absorption bands of polyatomic molecules. N.A.Borisevich, G.A.Zalesskaya, V.A.Lastochkina, T.Shukurov (Inst. of Phys., Acad. of Sci., Minsk, USSR). *Spectrosc. Lett. (USA)*, vol.15, no.12, p.991-1008 (1982). The effect of foreign gases (He, Ar, N_2 and CO_2) on IR vapour absorption bands corresponding to vibrations of different symmetry is studied for some symmetric- and asymmetric-top molecules (chloroform, bromoform, trichloroethylene, chlorobenzene, naphthalene). It is shown that rotational P-, Q- and R-branches collapse and a single structureless bandshape appears when foreign gases are added at no more than 75 atm pressure of CO_2 or 175 atm of N_2 . A conclusion is made that the contour variations in high pressure gas mixtures are satisfactorily interpreted by the J-diffusion model. (24 refs.)

33.80 PHOTON INTERACTIONS WITH MOLECULES

- 60845 SCF discrete-variational $X\alpha$ calculations of the NH_4Cl Auger spectrum. G.M.Mikhailov, G.L.Gutsev, Ju.G.Borod'ko (Inst. of Chem. Phys., Acad. of Sci., Chernogolovka, USSR). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.70-5 (25 March 1983). Formalism for calculations of the singlet and triplet Auger energies within the $X\alpha$ model is presented. Using this method the KVV Auger spectrum of NH_4Cl is calculated and the theoretical intensities are determined within a one-center approximation. The calculated spectrum reproduces quite well all the main features observed for solid NH_4Cl . A new interpretation of the spectrum is suggested. (24 refs.)

- 60846 On the statistics of an ensemble of oscillators under excitation. IV. Evaluation of the time for kinetic excitation into the quasicontinuum based on Kramers' theory. V.N.Sazonov, I.E.Khromov (Dept. of Theoretical Phys., P.N. Lebedev Phys. Inst., Moscow, USSR). *Chem. Phys. (Netherlands)*, vol.76, no.1, p.25-9 (1 April 1983). For pt.III see ibid., vol.69, no.3, p.459 (1982). The authors consider the model with kinetic excitation into the quasicontinuum (KEQ) for resonant polyatomic molecules which absorb laser radiation and are surrounded by buffer molecules. KEQ takes place when the resonant molecules in the lower part of the energy spectrum interact weakly with the laser radiation, but the molecules in the quasicontinuum are rapidly excited to still higher energy and dissociate. Under these conditions the collisions of the resonant and buffer molecules lead to excitation of resonant molecules into the quasicontinuum because the population of the quasicontinuum is much less than its thermodynamical equilibrium value. The smaller the V-T relaxation time τ_{VT} , the larger the rate of KEQ and the dissociation rate (if only τ_{VT} is not too small). Thus, if they change the experimental conditions and decrease τ_{VT} (for instance, by passing from the heavy buffer gas Xe to the light buffer gas He), for some resonant molecules they may observe that the probability of dissociation increases. (20 refs.)
- 60847 The line shape of a zero-field level-crossing effect in methyl fluoride. S.T.Sandholm, R.H.Schwendeman (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3476-82 (15 March 1983). The line shape of the zero-field level-crossing effect that occurs when $^{13}CH_3F$ is irradiated by the 9P(32) CO_2 laser has been recorded by an infrared laser

Stark spectrometer operating under computer control. The level-crossing effect, which occurs as a narrow decrease in the absorption due to superposition of the m components of the Doppler-broadened $R(4,3)$ transition in the n_2 band, has been recorded at several pressures. Comparison of the experimental line shapes with theoretically calculated curves leads to a value of 13.9 ± 0.9 MHz/Torr for the pressure broadening parameter for this transition. An algebraic solution is given for the linear system that occurs in the density matrix treatment of the steady state line shape of a level crossing or level anticrossing effect. The modifications of the solution required to treat three-level double resonance or two-photon effects are also given. (32 refs.)

60848 Comparison of quantal, classical, and semiclassical behavior at an isolated avoided crossing. D.W.Noid (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), M.L.Koszykowski, R.A.Marcus.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.4018-24 (15 March 1983). The quantal and classical/semiclassical behavior at an isolated avoided crossing are compared. While the quantum mechanical eigenvalue perturbation parameter plots exhibit the avoided crossing, the corresponding primitive semiclassical eigenvalue plots pass through the intersection. Otherwise, the eigenvalues agree well with the quantum mechanical values. The semiclassical splitting at the intersection is calculated from an appropriate Fourier transform. In this quasiperiodic regime, a quantum state near an avoided crossing is seen to exhibit typically more delocalization than the classical state. However, trajectories near the 'separatrix' display a quasiperiodic 'transition' between two zeroth order classical states. (20 refs.)

60849 Stimulated emission from the $A^1\Sigma_u^+$ band of sodium dimer. H.Itoh (Dept. of Phys., Kagawa Univ., Takamatsu, Japan), Y.Fukuda, H.Uchiki, K.Yamada, M.Matsuoka.

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1148-56 (April 1983). Intense stimulated emission from sodium vapor is observed at around 800 nm when it is pumped by a pulsed dye laser around 600 nm. The spectral lines are localized around 800 nm. To investigate the origin of this emission, the authors try to assign the stimulated lines excited by a dye laser at 632.8 nm (the wavelength of the He-Ne laser) and by a ruby laser at 694.3 nm. Moreover, the $A^1\Sigma_u^+$ transitions at 595.728 and 594.664 nm of a Na_2 which are newly assigned by using polarization labelling spectroscopy are excited by the output from a CW-dye-laser amplified with N_2 laser-pumped dye amplifier, and some of the stimulated lines are assigned. It is then concluded that the origin of these stimulated emission lines is the $A^1\Sigma_u^+$ transition. Also it can be explained that these stimulated lines come from around the band edge of the $A^1\Sigma_u^+$ transition.

60850 Interaction between high-intensity arbitrarily polarized radiation and molecules under collisional relaxation conditions. K.A.Nasyrov, A.M.Shalagin (Inst. of Automation & Electrometry, Acad. of Sci., Novosibirsk, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1298-303 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.1997-2007 (Oct. 1982). [received: April 1983]

Rate equations for the density matrix are used to describe classically the orientational states of the angular momenta of levels and are solved for arbitrary intensities and polarizations. Allowances are made for collisions which alter the velocity, orientation, and magnitude of the angular momentum, and also the quantum number of a molecular vibrational state. Expressions are derived for the polarization of the medium in the case of homogeneously and inhomogeneously broadened lines. An analysis is made of the polarization dynamics of high-intensity radiation (deformation and rotation of the polarization ellipse) during its propagation in amplifying (absorbing) media. (6 refs.)

60851 Subpicosecond time resolved multiphoton ionization: excited state dynamics of cis-stilbene under collision free conditions. B.I.Greene, R.C.Farrow (Bell Lab., Murray Hill, NJ, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3336-8 (15 March 1983). The authors report the result of a novel subpicosecond measurement performed on cis-stilbene in the vapor phase. They have extended a well-known pulsed laser technique into the 10^{-13} s time regime, and choose to focus renewed scientific attention on the dynamics of stilbene photoisomerization. They believe this measurement will establish the technique of gas phase multiphoton ionization as a viable and potentially powerful subpicosecond probe of intramolecular dynamics. An intense visible subpicosecond laser pulse is utilized to probe, via multiphoton ionization, a population of excited state cis-stilbene molecules. (15 refs.)

60852 Interactions between neutral dissociation and ionization continua in N_2O . P.M.Guyon, T.Baer, I.Nenner (LURE, Lab. CNRS, Univ. Paris-Sud, Orsay, France).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3665-72 (15 March 1983). Autoionized Rydberg states converging to the $A^2\Sigma^+$ and $B^2\Pi$ states of N_2O^+ are shown to be predissociated into neutral fragments. The decay to excited neutral fragments is observed by their fluorescence in the visible and ultraviolet regions of the spectrum. These decay channels are in competition with autoionization, which was shown in a previous study to yield unexpectedly large numbers of low energy electrons. On the basis of the striking similarity between the fluorescence excitation and the threshold photoelectron spectra, models are presented which connect dissociative channels to the production of threshold electrons. Ionization of dissociating neutral states and Rydberg states converging to the ground electronic state of $N_2O^+(X^2\Pi)$ are suggested as being responsible for the production of low energy electrons. The distribution of photoelectron energies resulting from such autoionization channels are calculated. (35 refs.)

60853 Auger spectra of tetrahedral halides and hydrides. R.R.Rye, J.E.Houston (Sandia Nat. Labs., Albuquerque, NM, USA).

J. Chem. Phys. (USA), vol.78, no.7, p.4321-30 (1 April 1983). Auger electron spectra are presented for the gas-phase molecular species CF_4 , SiF_4 , CCl_4 , and $SiCl_4$ and discussed in terms of the effect of the interaction of the two final-state holes on the spectral line shapes. The highly polar character of the bonding for this series leads to systematic behavior with respect to this hole-hole interaction, showing rare gas-like localized halide

spectra for SiF_4 and a delocalized component of increasing intensity as the authors proceed through the series to $SiCl_4$, CF_4 , and CCl_4 . The central atom spectra show a composite line shape resulting from the sum of two versions of the same one-electron final states but with different values of U (the hole-hole interaction energy). The Auger process occurs as a result of the electron density available at the central atom site but, since the one-electron orbitals are highly polarized towards the halide, the two holes principally appear around the halide sites. With both holes on the same halide site a rather large U results, but with the two holes on separate halide sites one obtains a reduced value of U . The relative intensity of the smaller U component appears to increase as we proceed through the series SiF_4 , $SiCl_4$, CF_4 , and CCl_4 . This tendency in both the halide spectra and in the central atom spectra depends on the strength of the intersite interaction. The molecular parameter which seems most reasonable to predict this division between localized and delocalized behavior is the ratio of the halide-halide distance to the halide radius. In addition, the authors demonstrate that for a rather extended series of molecular species the trends in the value of U can be predicted surprisingly well on the basis of an experimental value of U for Ne and the known atomic and molecular dimensions. The implications of this simple predictive capability to other molecular systems is discussed. (40 refs.)

60854 Stepwise photoionization of anthracene in the gas phase by ultraviolet laser pulses. G.A.Abakumov, B.I.Polyakov, A.P.Simonov, L.S.Chuiko, V.T.Yaroslavtsev.

Opt. & Spectrosc. (USA), vol.53, no.2, p.151-3 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.258-62 (Aug. 1982). [received: April 1983]

A quantitative study of two-photon stepwise ionization of anthracene in the gas phase is reported. The cross sections for the ionization of the excited singlet and triplet anthracene molecules were measured at various wavelengths of the exciting and ionizing beams. The results show that these cross sections depend on the amount of vibrational energy in the excited molecules for a given value of the total energy imparted to the molecules in the course of the two-step ionization. (6 refs.)

60855 Rotational intensities in photodetachment and photoionization. P.A.Schulz, R.D.Meard, W.C.Lineberger (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2229-32 (April 1983).

The authors extend the work on the frame-transformation method to give an analytic form for the relative intensities of rotational transitions in photodetachment and photoionization. The specific case of photoabsorption by a Σ species, resulting in a $^1\Pi$ species and an s electron, is treated analytically. The results are in good agreement with both threshold photodetachment cross sections and photoelectron spectra. (16 refs.)

33.80G Diffuse spectra; predissociation, photodissociation

60856 Precision measurements of hyperfine predissociation in I_2 vapor using a two-photon resonant scattering technique. R.E.Tench, S.Ezekiel (Res. Lab. of Electronics, MIT, Cambridge, MA, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.253-8 (1 April 1983).

A two-photon resonant scattering technique is used to measure natural line-widths of individual hyperfine components of the $v'=43$, $J'=12$ and 16 rovibrational levels in the I_2 B state ($^3\Pi_{0g^+}$). Differences in the linewidths due to hyperfine predissociation are precisely determined. The predissociation constants and the radiative linewidth for $v'=43$ are found to be $|d_v|^2 = 3.36 \pm 0.09$ kHz, $|c_v|^2 = 4.67 \pm 0.51$ Hz and $\Gamma_r = 51 \pm 4$ kHz, respectively. (17 refs.)

60857 Multiphoton dissociation of a rotating molecule. C.Bottcher (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), C.Feillade.

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.279-83 (8 April 1983). A formalism is outlined for multiphoton pumping and dissociation within a molecular rotational-vibrational ladder. The density matrix is expanded in spherical tensors, leading to a set of Bloch equations which take full account of the rotational degeneracy of the levels. Time-dependent solutions of these 'ladder' equations are analyzed in terms of normal modes, providing fresh insight into the mechanism of dissociation. (12 refs.)

60858 Rate equations analysis of vibrational quenching in IR multiphoton dissociation of pure SF_6 . Hai-Lung Dai (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.324-7 (8 April 1983).

A rate equations model was used to calculate the pressure dependence of SF_6 multiphoton dissociation yields caused by vibrational self-quenching. Between 1000 and 3000 cm^{-1} of energy is removed from SF_6 excited to ≥ 60 kcal/mole by collision with a cold SF_6 molecule at gas kinetic rate. Calculations have shown that the fluence dependence of dissociation varies strongly with pressure, and the decrease of dissociation at higher pressures can be approximated exponentially only for narrow pressure ranges. (18 refs.)

- 60859 Photodissociation of CO_2^- : evidence for a long-lived excited state.** D.E.Huntton, M.Hofmann, T.G.Lindeman, A.W.Castleman, Jr. (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.328-32 (8 April 1983). Energy analysis of the photofragment O^- ions produced in the photodissociation reaction $\text{CO}_2^- + h\nu \rightarrow \text{O}^- + \text{CO}_2$ identifies two distinct O^- production mechanisms: a two-photon absorption via an intermediate bound electronic state, and a collision-assisted single-photon process via a long-lived excited state. This species has a radiative lifetime exceeding one microsecond, and a collisional dissociation cross section measurably higher than that of the ground state. (19 refs.)
- 60860 The state distribution of OH radicals photodissociated from H_2O_2 at 193 and 248 nm.** G.Ondrey, N.van Veen, R.Bersohn (Dept. of Chem., Columbia Univ., New York, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3732-7 (15 March 1983). Photodissociation of H_2O_2 at 248 and 193 nm yields largely vibrationless OH radicals in their ground electronic state. At 248 nm, on the average about 64 and 3 kcal/mol of energy are released as translational and rotational energy, respectively. At 193 nm the corresponding quantities are 92 and 8 kcal/mol. The distribution of the OH radicals over K'' peaks near $K''=5$ when dissociated at 248 nm and near $K''=6$ at 193 nm but the latter distribution is somewhat broader. Doppler width anisotropy data imply that at 248 nm a single upper state is reached but that at 193 nm several upper surfaces may be responsible for the absorption. It is concluded that the upper state potential functions(s) may be represented by the sum of a large repulsive term depending only upon the distance between centers of mass of the OH radicals and a small angularly dependent term which generates the rotational excitation. (25 refs.)
- 60861 Infrared photodissociation of sulfur dioxide ions in a fast ion beam.** H.Stein, M.Erben-Russ, K.L.Kompa (Max-Planck-Inst. für Quantenoptik, Garching, Germany). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3774-8 (15 March 1983). A laser-ion beam apparatus for studying laser-induced photodissociation and fragmentation of fast molecular ions in both coaxial and crossed beams configurations has been constructed. IR photodissociation of highly internally excited SO_2^+ ions is reported using a low power cw CO_2 laser. The fragmentation of SO_2^+ into $\text{SO}^+ + \text{O}$ and $\text{S}^+ + \text{O}_2$ has been observed and the relative dissociation yields as function of laser frequency and power dependence of the two dissociation channels have been measured. No IR photodissociation could be observed for SO^+ and SO_3^+ at 934.9 cm^{-1} . (24 refs.)
- 60862 Multiphoton dissociation of OCCl_2 at 193 nm: formation of electronically excited Cl_2 .** M.W.Wilson, M.Rothschild, C.K.Rhodes (Dept. of Phys., Univ. of Illinois, Chicago, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3779-84 (15 March 1983). Two-quantum excitation of OCCl_2 with 193 nm radiation, although corresponding to an energy above the ionization limit, is observed to produce a yield upon dissociation into excited neutral fragments; namely, CO in the $\nu=7$ of its $X^1\Sigma^+$ state and Cl_2 in the first electronically excited Cl_2^* and Cl_2^+ states of ionic character. Strong emissions originating from Cl_2^* were observed at 199 and 258 nm together with a weaker band at 244 nm. The radiative lifetime τ_r of the $\text{Cl}_2^*(\text{Cl}_2^*)$ state was determined to be $\tau_r=23\pm 2$ ns. Quenching rate constants of the $\text{Cl}_2^*(\text{Cl}_2^*)$ level by rare gases were also measured. Strong enhancement of the 258 nm radiation was observed in the presence of He and Ne, while intense emissions from KrCl^* and XeCl^* indicate the role of atomic displacement reactions of the type $\text{Cl}_2^* + (\text{Kr/Xe}) \rightarrow (\text{Kr/Xe})\text{Cl}^* + \text{Cl}$. (30 refs.)
- 60863 The unimolecular reaction of $(\text{CH}_3)_2\text{CNO}$ following $n-\pi^*$ excitation with a tunable dye laser.** H.Reisler, F.B.T.Pessine, Y.Haas, C.Wittig (Univ. of Southern California, Los Angeles, CA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3785-91 (15 March 1983). The predissociation of $(\text{CH}_3)_2\text{CNO}$ following the 570-710 nm laser excitation of the $n-\pi^*$ transition is reported. The small fluorescence quantum yield and its short lifetime (<20 ns) indicate efficient radiationless processes prior to dissociation. NO is the major dissociation product and its concentration was monitored in real time by using the two-photon laser excited fluorescence technique. The NO yield as a function of wavelength followed very closely the absorption contours of $(\text{CH}_3)_2\text{CNO}$. The NO production rate was $>10^6 \text{ s}^{-1}$ at all wavelengths studied and this rate is too fast to be consistent with a mechanism involving a radiationless transition to the ground electronic state followed by energy randomization and dissociation. Alternative predissociation mechanisms are considered. (37 refs.)
- 60864 Competing dissociation channels in the infrared multiphoton decomposition of ethyl vinyl ether.** F.Huisken, D.Krajnovich, Z.Zhang, Y.R.Shen, Y.T.Lee (Materials & Molecular Res. Div., Lawrence Berkeley Lab., Berkeley, CA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3806-15 (15 March 1983). Infrared multiphoton decomposition of ethyl vinyl ether (EVE) has been investigated by the crossed laser-molecular beam technique. Competition is observed between the two lowest-energy dissociation channels: (1) $\text{EVE} \rightarrow \text{CH}_3\text{CHO} + \text{C}_2\text{H}_4$, and (2) $\text{EVE} \rightarrow \text{CH}_2\text{CHO} + \text{C}_2\text{H}_5$. Center-of-mass product translational energy distributions were obtained for both dissociation channels. The products of reactions (1) and (2) are formed with mean translational energies of 31 and 5 kcal/mol, respectively. The branching ratio shifts dramatically in favor of the higher energy radical producing channel as the laser intensity and energy fluence are increased, in agreement with the qualitative predictions of statistical unimolecular rate theory. (24 refs.)
- 60865 Rotational predissociation of the Ar.HCl van der Waals complex: close-coupled scattering calculations.** C.J.Ashton, M.S.Child (Theoretical Chem. Dept., Oxford Univ., Oxford, England), J.M.Hutson. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4025-39 (15 March 1983). The authors report an extensive computational study of rotationally predissociating metastable states of the Ar.HCl van der Waals complex, using a highly realistic empirical intermolecular potential recently proposed by Hutson and Howard (1982). The states are characterized by fully converged, close-coupled, scattering calculations. Resonance energies, widths, and partial widths are extracted by fitting the energy dependence of S matrices. Total angular momenta of 0 and 1 are studied, and the calculations span an energy range from 0 to 1400 cm^{-1} . The resonance widths vary from $<10^{-4}$ to $>5 \text{ cm}^{-1}$, and it is shown that the isolated narrow resonance approximation calculations enables assignment of approximate quantum numbers to the metastable states. Physical explanations are suggested for the strong trends in resonance parameters as a function of the intermolecular stretching, diatom rotation, and molecule-fixed angular momentum projection quantum numbers. A changeover from a near-molecular-fixed to a near-space-fixed coupling scheme, as angular momentum is increased, is clearly demonstrated. The results are of considerable relevance to the design of experiments and the development of approximate computational methods in this area. (50 refs.)
- 60866 Predissociation of HD-Ar van der Waals molecules by internal rotation.** J.M.Hutson, R.J.Le Roy (Guelph-Waterloo Centre for Graduate Work in Chem., Univ. of Waterloo, Waterloo, Ontario, Canada). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4040-3 (15 March 1983). Accurate close-coupling calculations of level energies and widths of predissociating levels of HD-Ar have been carried out using the Le Roy-Carley BC_3 potential (1980) for H_2 -Ar. The calculated widths agree well with the experimental data of McKellar (1982). The principal product from predissociation of $\text{HD}(\nu=1, j=2) \rightarrow \text{R}$ is HD in its $\nu=1, j=1$ state. This channel is symmetry forbidden for $\text{H}_2(1,2)$ -Ar, and its presence accounts for the much larger spectroscopic linewidths found for HD-Ar. (14 refs.)
- 60867 Photodissociation of NH_3 at 106-200 nm.** M.Suto, L.C.Lee (Dept. of Electrical & Computer Engng., San Diego State Univ., San Diego, CA, USA). *J. Chem. Phys. (USA)*, vol.78, no.7, p.4515-22 (1 April 1983). Cross sections and quantum yields of emissions from the photofragments of NH_3 were measured in the 106-200 nm region using synchrotron radiation as a light source. The emission systems of NH_2 ($A^2A_1 \rightarrow X^2B_1$), $\text{NH}(c^1\Pi \rightarrow a^1\Sigma^+)$, and $\text{NH}(b^1\Sigma^+ \rightarrow X^2\Sigma^+)$ were observed from the NH_3 photodissociation. The dependences of emission intensities on the NH_3 and/or He (buffer gas) pressures were studied. The $\text{NH}(c \rightarrow a)$ and $\text{NH}(b \rightarrow X)$ emissions were observed when the $\text{NH}_2(A^2A_1)$ species was quenched by 10 Torr of He. The $\text{NH}(b \rightarrow X)$ and $\text{NH}(c \rightarrow a)$ emissions start to appear at 182.3 ± 1.5 and 127.9 ± 0.9 nm, respectively. From these emission thresholds the threshold energy for photodissociation of NH_3 into $\text{NH}(X^2\Sigma^+) + \text{H}_2(X^1\Sigma^+)$ is determined to be 4.17 ± 0.06 eV, and the upper limit for the heat of formation of NH is 3.81 ± 0.06 eV. For excitation wavelengths longer than 128 nm the $\text{NH}(b^1\Sigma^+)$ species is produced by a primary photodissociation process, and at shorter excitation wavelengths the $\text{NH}(b^1\Sigma^+)$ may be partly produced by a cascading process following the $\text{NH}(c \rightarrow b)$ transition. Contrary to previous theoretical interpretations, all the vibronic levels of the NH_3 (B and C) states produce the $\text{NH}_2(A \rightarrow X)$ emission. The quantum yield for the C state is lower than that of the B state. The vibronic levels of the C state are renumbered in accordance with their quantum yields. (38 refs.)
- 60868 Influence of temperature on the photodecomposition of various molecules with the formation of electronically excited fragments.** I.P.Vinogradov, V.V.Firsov. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.26-8 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.46-50 (July 1982). [received: April 1983]. The photolysis of NH_3 I and N_2H_4 II molecules at room temperature and at elevated temperatures has been studied. The absolute cross sections of the decomposition of I and II into electronically excited fragments in the range from the threshold to 90 nm have been determined at these temperatures. It has been established that there is a marked increase in the cross section of formation of $\text{NH}(A^2\Pi)$ and $\text{NH}_2(A^2A_1)$ in the photolysis of II with increase in temperature. Possible mechanisms of this phenomenon have been discussed. (9 refs.)
- 60869 Saturation laser photodissociation of a gas of diatomic molecules.** M.A.Vaksman. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.154-7 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.263-9 (Aug. 1982). [received: April 1983]. Saturation photodissociation is analyzed theoretically. The heat of reaction and the scale time for the relaxation to a steady-state distribution are calculated. An equation relating the local densities of atoms and molecules during the dissociation is found. A method is proposed for finding the steady-state spatial distribution of atoms in the absence of diffusion, for slow diffusion, and also for very rapid diffusion. A solution is derived for an arbitrary diffusion coefficient in a particular case. The stability of the steady-state distribution is analyzed. (12 refs.)
- 60870 Site-specific fragmentation of small molecules following soft-X-ray excitation.** W.Eberhardt (Dept. of Phys., Brookhaven Nat. Lab., Upton, NY, USA), T.K.Sham, R.Carr, S.Krummacher, M.Strongin, S.L.Weng, D.Wesner. *Phys. Rev. Lett. (USA)*, vol.50, no.14, p.1038-41 (4 April 1983). Soft-X-ray excitation involving C 1s electrons in CO and acetone, $(\text{CH}_3)_2\text{CO}$, is found to result in ionic fragmentation of the original molecule. The fragmentation pattern changes whether the C 1s electron gets ionized or excited into a Rydberg-line orbital or into an antibonding π^* molecular orbital. Moreover, the fragmentation occurs specifically around the site of the carbon atom where the optical excitation takes place. Based on these observations one might consider the use of tunable soft X-rays to stimulate chemical reactions or to selectively break large organic molecules. (15 refs.)
- 60871 Laser spectroscopy on ion beams: application to the polyatomic ion N_2O^+ .** M.Dufay (Lab. de Spectrometrie Ionique et Moleculaire, Univ. Lyon-I, Lyon, France). *Rev. Cethedec (France)*, vol.19, no.NS82-2, p.97-111 (1982). In French. Presents a photodissociation study of a highly accelerated molecular ion beam by interaction with collinear laser radiation. The development of a high resolution spectroscopy method using nonoptical detection is described. The hyperfine structure of N_2O^+ is studied in its $A^2\Sigma^+$ state. (11 refs.)
- 60872 Analysis of multistage dissociation of polyatomic molecules.** V.M.Akulov, N.V.Karlov, A.M.Prokhorov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1274-6 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.1955-9 (Oct. 1982). [received: April 1983]. Simple models are used to investigate the laws governing the behavior of molecules near the dissociation limit on exposure to high-power laser radiation. It is shown that anomalous dependences of the dissociation probability on the laser radiation intensity may be observed for some molecules. (2 refs.)
- 60873 Photodissociation of Xe_2^+ and Kr_2^+ in the ultraviolet.** A.W.McCown, M.N.Ediger, S.M.Stazak, J.G.Eden (Univ. of Illinois, Urbana, IL, USA). *Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983* (Washington, DC, USA: Opt. Soc. America 1983), p.TuC3/1-4. Describes an optical method which has been developed for detecting Xe_2^+ and Kr_2^+ in real-time by photodissociating these ions in the ultraviolet with a UV (XeF or N_2) laser. (2 refs.)
- 60874 Multiphoton dissociation of phosgene (OCCl_2) at 193 nm: formation of electronically excited Cl_2^* .** M.W.Wilson, M.Rothschild, C.K.Rhodes (Dept. of Phys., Univ. of Illinois, Chicago, IL, USA). *Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983* (Washington, DC, USA: Opt. Soc. America 1983), p.WB4/1-8. Reports the observation of electronically excited Cl_2 upon dissociation of phosgene. Evidence for the formation of neutral fragments arising from states embedded in the ionization continuum is also discussed. (17 refs.)

33.80K Multiphoton processes

- 60875 Vibronic interactions in s-triazine spectra. G.Fischer, B.Katz (Dept. of Chem., Ben Gurion Univ. of the Negev, Beer-Sheva, Israel). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.47-51 (25 March 1983). The two-photon absorption spectrum of s-triazine has been measured using multiphoton ionization. A vibronic coupling scheme, comprising the first excited 'E' state coupled by the $\nu_6(e')$ vibration to the ' A_2 ' and ' A_1 ' states, successfully reproduces the essential features of the absorption, fluorescence and two-photon absorption spectra. (11 refs.)
- 60876 Two-photon ionization. Capability of lasers for trace analysis. L.Woste (Inst. de Phys. Experimentale, Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland). *Laser & Optoelektron. (Germany)*, vol.15, no.1, p.9-15 (March 1983). In German. The method of two-photon ionization (TPI) has been used to study metal complexes under molecular beam conditions. The molecules were electronically excited using a tunable laser, and then ionized by a second laser, in order to be detected by means of mass spectrometry. The spectra obtained show clearly the vibrational and rotational structure of the molecules investigated. Particle mixtures and subsequent fragmentation processes are well separated by the mass spectrometer. A careful analysis of the power dependencies allowed the determination of the optimum operation parameters for the laser system. In this way, detection efficiencies close to 'single molecule detection' were obtained. Since the method exhibits an extreme selectivity, it seems to be well suited for the analysis of trace amounts. (16 refs.)
- 60877 Resonant multiphoton ionization of H_2 via the $B^1\Sigma_u^+$, $v=7$, $J=2$ and 4 levels with photoelectron energy analysis. S.T.Pratt, P.M.Dehmer, J.L.Dehmer (Argonne Nat. Lab., Argonne, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.7, p.4315-20 (1 April 1983). The authors report measurements of photoelectron spectra of an electronically excited state of $\text{H}_2(B^1\Sigma_u^+)$ in selected vibrational and rotational levels. The excited state was prepared by resonant three photon excitation of $\text{H}_2 X^1\Sigma_g^+$, $v=0$, $J=3$ and subsequently, was ionized by a single additional photon. Partially resolved rotational structure is observed in the photoelectron spectra and is discussed in terms of the selection rules for direct photoionization and the partial wave composition of the ejected photoelectrons. An additional peak is observed in the spectra, which is tentatively interpreted as arising from photoionization of $\text{H}^+(n=2)$ formed by photodissociation of H_2 in the $B^1\Sigma_u^+$ state. (24 refs.)
- 60878 Systematics in two-photon rovibrational contours of 14_0^1 ($B_{2u}^1-A_{1g}^1$) in benzene derivatives. A.N.Thakur, L.Goodman (Dept. of Chem., Rutgers Univ., New Brunswick, NJ, USA). *J. Chem. Phys. (USA)*, vol.78, no.7, p.4356-62 (1 April 1983). Two-photon rotational contours of the principal vibronic band (14_0^1) in the $B_{2u}^1-A_{1g}^1$ transition in benzene and its $s\text{-C}_6\text{H}_5\text{D}$, $o\text{-C}_6\text{H}_4\text{D}_2$, $\text{C}_6\text{H}_5\text{F}$, $p\text{-C}_6\text{H}_4\text{F}_2$, $o\text{-C}_6\text{H}_4\text{F}_2$ derivatives have been recorded by multiphoton ionization at room temperature with a laser excitation bandwidth of 0.1 cm^{-1} . The main peaks in the rotational contour are shown to result from multiple coincidences of rovibronic transitions due to 'oblate rotorlike' and 'prolate rotorlike' behaviour of the asymmetric rotor molecules. The observed separations between these features agree very well with the predicted ones obtained from simple formulas. These systematics in the two-photon rotational contours are found to hold over a range of the asymmetry parameter from the least $\kappa=1$ to $\kappa=-0.9$. The theory is used to obtain the rotationless origin for each of the molecules studied. (33 refs.)
- 60879 Comparison of the Floquet and rotating-wave methods for multiphoton excitation of SF_6 . D.C.Clary (Dept. of Chem., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England). *J. Phys. Chem. (USA)*, vol.87, no.5, p.735-9 (3 March 1983). The Floquet method of calculating exact molecular multiphoton transition probabilities for a given Hamiltonian is compared to the rotating-wave approximation (RWA). The two methods are used in calculations on the multiphoton excitation of the ν_3 vibrational mode of SF_6 . An accurate, three-dimensional molecular Hamiltonian is employed. The rotating-wave and Floquet results are in excellent agreement. (13 refs.)

(for molecular solids, see 31.70K)

- 60881 Corrected formula for first quantum corrections to second virial coefficients for nonspherical molecules. R.T.Pack (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.171-4 (1 April 1983). The formulas of Wang Chang (1944), commonly used to calculate quantum corrections to the second virial coefficient for anisotropic interactions, are found to contain an error. A simple, correct formula, valid for any like or unlike combination of atoms and molecules of complexity up to and including symmetric tops, are given. (11 refs.)
- 60882 A simple analytical approximation for the potential energy of diatomics. I.K.Dmitrieva, V.A.Zenevich (Lukov Heat & Mass Transfer Inst., Acad. of Sci., Minsk, Belorussian SSR). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.228-31 (1 April 1983). A correlation between the Dunham expansion coefficients, $a_2 \approx 0.64a_1^2$, is found which holds for diatomics of different types. Based on this correlation, a four-parameter power approximation using ω_e , B_e , α_e and D_e is suggested which reproduces the ground-state potential curves for diatomics within 2%. (9 refs.)
- 60883 Improvement for the RKR procedure obtained by semiclassical calculations. G.Gouedard, J.Vigue (Lab. de Spectroscopie Hertzienne, ENS, Paris, France). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.293-5 (8 April 1983). The authors present a new technique to improve RKR molecular potential curve calculations. The potential curve obtained gives calculated $G(v)$ and $B(v)$ values extremely close to the measured ones. The aim of these calculations is the same as that of the inverted perturbation approach of Vidal and Sheingraber (1977), but the potential-well corrections are calculated by using Watson's (1979) semiclassical inversion procedure. (6 refs.)
- 60884 A simple treatment of intermolecular interactions: synthesis of ab initio calculations and combination rules. J.Hoinkis, R.Ahlrichs, H.-J.Bohm (Inst. für Phys. Chemie und Elektrochem., Univ. Karlsruhe, Karlsruhe, Germany). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.821-34 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982). A new technique for a simple and efficient treatment of intermolecular interactions is proposed and tested. The method is based on an approximation of the first order SCF term $E_{\text{SCF}}^{(1)}$ which is the most structured contribution to the total interaction. $E_{\text{SCF}}^{(1)}$ is represented by a site-site potential V of (exp,

1/R)-type, which accounts for the exchange plus penetration and the long range Coulomb forces (by means of a point charge model). The individual contributions to V are obtained by means of combination rules from corresponding site parameters of interacting molecules. The site parameters are consequently molecular and not intermolecular properties and can conveniently be determined by probing a molecule with appropriate test particles. Site parameters are reported for He, Ne, Ar, N_2 , CO , CO_2 , CS_2 , and HCl. Comparisons show close agreement of V with E_{SCF} which in turn is close to ΔE_{SCF} if polarization and charge transfer effects are small. (40 refs.)

60885 Hindered internal rotations in Van der Waals molecules and molecular crystals. W.J.Briels, J.Tennyson, M.Claessens, T.Van der Lee, A.Van der Avoird (Inst. of Theoretical Chem., Univ. of Nijmegen, Nijmegen, Netherlands).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.1091-100 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The quantum dynamical behavior of the Van der Waals molecule $(N_2)_2$ and that of the ordered α and γ phases of solid N_2 have recently been calculated, starting from the same ab initio N_2-N_2 potential. By interpreting the results of these calculations the authors try to improve their understanding of the libration/internal rotation motions of the N_2 monomers and the orientational order-disorder (α - β) phase transition. Some new results are presented and further (mean-field and libron-model) calculations are proposed which assess explicitly the intermolecular pair correlation effects caused by anisotropic interaction potential. (28 refs.)

60886 A semiclassical inversion procedure for the dipole-moment function for diatomic molecules. J.R.Stine (Los Alamos Nat. Lab., Los Alamos, NM, USA), D.W.Noid.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3647-51 (15 March 1983).

A simple formalism is presented to deduce the dipole moment as a function of internuclear distance from experimental vibrational intensity data. This method, like the RKR method for obtaining the potential-energy function, is based on the semiclassical WKB formalism and no particular functional form need be assumed for the dipole moment. The method is applied to the experimental data of Sileo and Cool (1976) for HF. (29 refs.)

60887 Matrix elements for Morse oscillators. V.S.Vasan, R.J.Cross (Dept. of Chem., Yale Univ., New Haven, CT, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3869-71 (15 March 1983).

The authors have derived exact analytic expressions for the following matrix elements for a Morse oscillator: $\langle m | \exp[\gamma(r-r_0)] | n \rangle$, $\langle m | (r-r_0) \exp[-a(r-r_0)] | n \rangle$, and $\langle m | (r-r_0) \exp[-2a(r-r_0)] | n \rangle$, where a is the Morse range parameter and γ is an arbitrary constant. They have found that several of the commonly used expressions for various diagonal matrix elements of the Morse oscillator involve considerable roundoff error. Due to near cancellation of terms the result may be many orders of magnitude lower than any of the terms. They obtain simple yet accurate asymptotic approximations for the diagonal elements which avoid these problems. These approximations are obtained for $\langle m | (r-r_0) | m \rangle$, $\langle m | (r-r_0)^2 | m \rangle$, and the cases mentioned above. (12 refs.)

60888 The dissociation energies of the diatomic alkali hydrides. S.C.Yang, D.D.Nelson, Jr. (Dept. of Chem., Univ. of Rhode Island, Kingston, RI, USA), W.C.Stwalley.

J. Chem. Phys. (USA), vol.78, no.7, p.4541-3 (1 April 1983).

A new method for estimating the dissociation energies for the alkali hydride molecules is reported. It involves extrapolating the known Rydberg-Klein-Rees potential curve of the $A^1\Sigma^+$ state to the ionic-covalent avoided crossing point. The estimated dissociation energies $D_e(X)$ are $16000 \pm 400 \text{ cm}^{-1}$ for NaH, $15020 \pm 400 \text{ cm}^{-1}$ for KH, and $14580 \pm 600 \text{ cm}^{-1}$ for RbH. (31 refs.)

60889 An improved self-interaction-corrected local spin density functional for atoms. J.G.Harrison (Dept. of Phys., North Dakota State Univ., Fargo, ND, USA).

J. Chem. Phys. (USA), vol.78, no.7, p.4562-6 (1 April 1983).

The application of the self-interaction-corrected local spin density approximation (SIC-LSDA) to atoms is reexamined. It is shown that a more careful application of the central-field approximation results in a modified functional which yields accurate total energies, correlation energies, and, in the 'exchange-only' (X-O) version, exchange energies in good agreement with Hartree-Fock (HF) values. It is also shown that the X-O version of the earlier SIC-LSDA functional yields total energies in close agreement with experiment for second-row atoms. The proposed modification removes this tendency of the X-O functional to mimic a correlated functional. (25 refs.)

60890 On the application of the Rydberg-Kratzer potential to some diatomic molecules. K.Ramani, A.M.Ghodgaonkar (Western Regional Instrumentation Centre, Univ. of Bombay, Bombay, India).

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.4, p.379-80 (April 1983).

The spectroscopic constants α_e and $\omega_e X_e$ for some diatomic molecules have been calculated using a combination of the Rydberg and Kratzer potentials. The dissociation energies D_e for these molecules were calculated previously by others using RKR potential energy curves. Agreement of the authors' spectroscopic constants with experimental data is satisfactory. (9 refs.)

60891 Ground-state diatomic potentials. P.Huxley, J.N.Murrell (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.2, p.323-8 (Feb. 1983).

Extended-Rydberg potentials have been derived for the ground states of all diatomic molecules obtained from atoms in the periodic list Li to Cl for which accurate spectroscopic data are available. From a comparison with RKR data where these are known the authors conclude that this simple function is an excellent representation of the potential in the valence region. (14 refs.)

60892 Study of ion-molecule and ion-ion interactions in nitromethane medium by means of infrared absorption spectroscopy. L.S.Perelygin, M.A.Klimchuk.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.531-5 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.761-6 (May 1982). [received: Feb. 1983]

Presents results obtained in an IR spectroscopic study of ion-molecule and ion-ion interactions that are realized in solutions of $LiClO_4$, $Mg(ClO_4)_2$, and LiNCS in nitromethane. These salts have relatively high solubilities in nitromethane, and hence the authors were able to determine the influence of the counter-ion type on the interactions under investigation and to follow the concentration dependence of the observed effects. Spectra over a range of $400-4000 \text{ cm}^{-1}$ were obtained in a UR-20 infrared spectrophotometer equipped with a two-beam thermostated cuvette for temperature studies and the band positions were determined to within $\pm 1-2 \text{ cm}^{-1}$. (16 refs.)

60893 Analytic expression for bound-bound and bound-free dipole transition matrix elements of atomic inner shells. M.S.Wang, R.H.Pratt (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.1939-42 (April 1983).

Analytic expressions are obtained which well represent the nonrelativistic single-electron ($nl, n'l'$) dipole transition rates in screened central potentials, not only when both states are inner shell in character, as had been previously achieved, but also when only one of the states has an inner-shell character. The key idea is to expand one of the screened bound-state wave functions (outer shell) in terms of an unbound negative-energy Coulomb wave function with the same energy shift as the screening shift of the inner-shell bound state. The expressions obtained are an analytic continuation (in photon energy) of corresponding bound-free matrix elements. (15 refs.)

60894 Long-range forces between a charged and neutral system. G.Feinberg (Dept. of Phys., Columbia Univ., New York, NY, USA), J.Sucher.

Phys. Rev. A (USA), vol.27, no.4, p.1958-67 (April 1983).

Dispersion-theory techniques, previously used to calculate the two-photon exchange potential $V_{2\gamma}(R)$ between two neutral systems, are used to study $V_{2\gamma}(R)$ acting between a neutral system A and a charged system B . For the case when A is an atom and B an electron, general results are given for all corrections of order λ_e/R or of order $(a_0/R)^2$ relative to the leading R^{-4} term. (13 refs.)

60895 Determination of interatomic potentials via the single scattering function on a surface. Nguyen Nam Anh, R.G.Barantsev, V.L.Sergeev.

Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR), no.1, p.120-2 (Jan. 1983). In Russian.

The inverse scattering problem is solved for a finite mass ratio and oblique incidence. For steep potentials some asymptotic formulas are given. (4 refs.)

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.9-13 (25 March 1983).

Accurate quantum-mechanical values of the collision-induced absorption coefficient are reported for a Ne-Ar mixture in the binary-collision approximation. Two of the known expressions for the induced dipole moment are tested and two others are proposed to obtain good agreement with experiment. (9 refs.)

60897 A quantum-mechanical explanation of vibronic phenomena in atom-molecule collisions. M.R.Spallburg, J.Los (FOM Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands), Sidis V.

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.14-19 (25 March 1983).

The quantum-mechanical equivalent of a classically vibrating molecular ion during an ion-pair formation collision is presented. The classical vibration in the quantal representation is explained as an interference between partial waves which evolve along neighbouring vibronic states during the collision. (14 refs.)

- 60898 Zeeman transitions in collisions of Na with Xe.** T.F. George (Dept. of Chem., Univ. of Rochester, Rochester, NY, USA), P.L. Devries. *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.99-102 (25 March 1983). Transitions between the Zeeman states of a sodium atom induced by collision with a ground-state xenon atom have been investigated by quantum-mechanical methods. The calculations were carried out using the pseudo-potentials of Czuchaj and Sienkiewicz (1979), and results pertinent to crossed atomic beam experiments are reported. Comparison with previous theoretical work indicates that thermally averaged cross section (relevant to cell-type experiment) would be in excellent agreement with recent experimental results. (20 refs.)
- 60899 Observation of two components in molecular cusp spectra for \sim MeV/u H^+ , He^{+2} projectiles on $m \geq 4$ hydrocarbon molecules.** G. Bissinger, J. Gaiser, J.M. Joyce (East Carolina Univ., Greenville, NC, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1015-17 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). The authors report the results of an investigation of the cusp shapes obtained for varying size hydrocarbon molecule targets bombarded with \sim MeV/u H^+ , He^{+2} projectiles. The results also indicate the presence of multiple contributions to the overall cusp shape for the larger molecules. (7 refs.)
- 60900 Anisotropies of the Na₂-rare gas interaction potentials from angularly resolved inelastic scattering.** P.L. Jones, E. Gottwald, U. Heftner, K. Bergmann (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3838-41 (15 March 1983). Rotational rainbow angular positions in the inelastic differential scattering cross sections of argon, krypton, and xenon from Na₂ are reported. The observed transitions for small rotational quantum number change ($\Delta j \leq 16$) are analyzed in terms of the classical model of hard ellipsoid scattering which relates the rainbow angle to the anisotropy ϵ of the potential, where ϵ is the difference in length of the long and short axes. The analysis yields $\epsilon = 0.67 \pm 0.05$, 0.79 ± 0.09 , and 0.66 ± 0.05 Å for the systems Na₂-Ar, Kr, and Xe, respectively. From earlier work, the anisotropies for Na₂-He and Na₂-Ne are known to be $\epsilon = 0.70$ (calculated) and 0.72 ± 0.05 Å. The data demonstrate the similarity within this model for the anisotropies of all the Na₂-rare gas interaction potentials for low effective collision energies. (21 refs.)
- 60901 Topography of potential energy surfaces: DIM surface for $H+F_2$.** J.J. Duggan, R. Grice (Chem. Dept., Univ. of Manchester, Manchester, England). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3842-9 (15 March 1983). Potential energy surfaces have been calculated over the full range of nuclear configurations for the $H+F_2$ reaction using the DIM method with the 14 polyatomic basis functions arising from the atomic states $H(2S)$, $F(2P_x)$, $H^+(1S)$ and $F^-(1S)$. The lowest potential energy surface agrees with the LEPS surface only in the collinear configuration. Qualitatively different forms are observed in strongly bent configurations which are determined by configuration interaction with low-lying surfaces corresponding to electronically excited states which are inadequately treated in the LEPS formulation. Trajectory calculations using the LEPS surface at higher collision energy or for vibrationally excited F_2 are likely to give erroneous results when broadside configurations contribute to the scattering. (22 refs.)
- 60902 A complete energy transfer map for COF_2 .** J.L. Ahl, R.K. Bohn, K.H. Casleton, Y.V.C. Rao, G.W. Flynn (Dept. of Chem., Columbia Univ., New York, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3899-906 (15 March 1983). Fluorescence from the v_1 , v_4 , v_6 , and v_3/v_2 states has been observed following Q-switched CO_2 laser excitation of the v_2 C-F stretch mode of COF_2 . A kinetic model is presented which is consistent with the observed fluorescence lifetimes. Following excitation of the v_2 mode, $2v_2$ is rapidly pumped by ladder climbing collisions. The $2v_2$ states are collisionlessly coupled to the v_1 mode by Fermi resonance leading to the creation of a steady state between the v_1 and v_2 manifolds with 30 gas kinetic collisions. Subsequently, the v_2 state decays to the v_6 mode in 800 collisions, and also fills the v_4 mode in 2000 gas kinetic collisions. The v_4 level rapidly equilibrates with the near resonant states $2v_3$, $2v_5$, and v_3+v_5 after about 25 collisions, and these states rapidly decay to the v_3 and v_6 fundamentals in less than or about 100 collisions. The v_6 state relaxes to the v_3/v_2 states, in approximately 190 collisions, while vibration-translation/rotation relaxation of v_3 and v_2 to the ground state occurs on a time scale of 1200 collisions. (30 refs.)
- 60903 Complex coordinate calculations of Feshbach resonance energies and widths for a collinear triatomic system.** K.M. Christoffel, J.M. Bowman (Dept. of Chem., Illinois Inst. of Technol., Chicago, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3952-8 (15 March 1983). Complex resonance energies are calculated for a model triatomic system studied previously by Eastes and Marcus [W. Eastes and R.A. Marcus, *J. Chem. Phys.*, 59, 4757 (1973)]. The complex coordinate method is employed to obtain resonance positions and widths for six states. The positions are all in excellent agreement with previous scattering and stabilization results and there is also good agreement with the one width obtained previously from scattering calculations. The additional widths obtained are given for the first time. Some speculations about possible laser induced absorption and emission among these resonances and true bound states are made. (41 refs.)
- 60904 Calculation of higher-order semiclassical scattering phase shifts: the effect of a barrier maximum.** J. Luppi, P. Pajunen (Dept. of Phys. Chem., Univ. of Helsinki, Helsinki, Finland). *J. Chem. Phys. (USA)*, vol.78, no.7, p.4451-5 (1 April 1983). Evaluation of high-order semiclassical scattering phase shifts is extended to situations involving a potential barrier. Calculations by using appropriate semiclassical phase shift formulas yield accurate results for energies above and below as well as in the immediate neighbourhood of the barrier maximum. (14 refs.)
- 60905 Imbedded matrix Green's functions in atomic and molecular scattering theory.** J.V. Lill (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA), T.G. Schmalz, J.C. Light. *J. Chem. Phys. (USA)*, vol.78, no.7, p.4456-63 (1 April 1983). The paper presents a general, simple, and unified treatment of Green's function approaches to the solution of the sets of coupled second order differential equations encountered in the theory of inelastic and reactive scattering. The standard scalar theory of Sturm-Liouville problems is extended to systems of equations without recourse to spectral resolutions of the Green's operator. A nonstandard approach to invariant imbedding is then developed to yield the most general kind of recursion relation for Wigner R matrices possible; the R-matrix propagation of Light and Walker (1976) and the variable interval-variable step algorithm of Parker, Schmalz, and Light (1980) are shown to be particularly simple examples of this more general scheme. Extensions and simplifications are offered. Also recurrence relations, stabilization of solutions, adiabatic and diabatic representations, and the use of nonorthogonal bases are all treated in a transparent manner. (33 refs.)
- 60906 Exact scattering solutions in an energy sudden (ES) representation.** B. Chang, L. Eno, H. Rabitz (Dept. of Chem., Princeton Univ., Princeton, NJ, USA). *J. Chem. Phys. (USA)*, vol.78, no.7, p.4477-85 (1 April 1983). In the paper, the authors lay down the theoretical foundations for computing exact scattering wave functions in a reference frame which moves in unison with the system internal coordinates. In this frame the (internal) coordinates appear to be fixed and its adoption leads very naturally (in zeroth order) to the energy sudden (ES) approximation [and the related infinite order sudden (IOS) method]. For this reason they call the new representation for describing the exact dynamics of a many channel scattering problem, the ES representation. Exact scattering solutions are derived in both time dependent and time independent frameworks for the representation and many interesting results in these frames are established. It is shown, for example, that in a time dependent frame the usual Schrodinger propagator factorizes into internal Hamiltonian, ES, and energy correcting propagators. They also show that in a time independent frame the full Green's functions can be similarly factorized. Another important feature of the new representation is that it forms a firm foundation for seeking corrections to the ES approximation. Thus, for example, the singularity which arises in conventional perturbative expansions of the full Green's functions (with the ES Green's function as the zeroth order solution) is avoided in the ES representation. Finally, a number of both time independent and time dependent ES correction schemes are suggested. (27 refs.)
- 60907 Light-induced collisions involving molecules without change in the chemical bonds.** V.S. Dubov. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.22-6 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.40-5 (July 1982). [received: April 1983]. The simplest case of light-induced collisions with the participation of molecules, involving an atom A and a diatomic molecule BC in a weak electromagnetic field, has been examined. The conditions for the applicability of the approximations previously used in the study of light-induced collisions of atoms have been studied. In particular, the correctness of the two-state approximation has been discussed. In a weak field, it is applicable if the intermolecular interaction is weak and adiabatic. The overlap of the lines of light-induced collisions leads to the formation of an unresolved band, which can be constructed by summation of the lines. The analytical equations obtained have been used to estimate the parameters of the absorption band of the light-induced collision $Cs(6^2S_{1/2}) + CO(\nu''=0) + h\nu \rightarrow Cs(7^2S_{1/2}) + CO(\nu'=1)$. It has been shown that the reduced absorption coefficient for this reaction reaches 10^{-41} cm². The possibility of carrying out the experiment has been discussed. (24 refs.)
- 60908 Spectral evidence of line collisional interference in NH_3 inversion spectrum.** A.I. Petrova. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.31-3 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.55-9 (July 1982). [received: April 1983]. In this work an analysis, based on collision theory and taking into account exchange between inversion emission and absorption lines, of the anomaly in the information of the form of the inversion spectrum of NH_3 is presented. In the range of pressures where the collision approximation is applicable an analysis of absorption for such microsystems as NH_3-N_2 , NH_3-CO_2 , NH_3-NH_3 is given; and a comparison of contours computed in the approximation of isolated lines with the shape of an inversion spectrum, taking account of spectral exchange between inversion lines, is presented. With the help of the computed parameter α describing the quadratic dependence of frequency shift on pressure, one can determine at which inversion frequency for given pressure maximum absorption will be observed. (9 refs.)
- 60909 Effect of collisional mixing of lower levels of Li-like ions on the intensity of the resonance line satellite structures of He-like ions.** S.A. Pikuz, I.Yu. Skobelev, A.N. Tkachev, A.Ya. Faenov. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.194-5 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.333-6 (Aug. 1982). [received: April 1983]. Presents an analysis of the effect of collisional transitions between the $1s^2 2s^2 S_{1/2}$, $1s^2 2p^2 P_{1/2}$, and $1s^2 2p^2 P_{3/2}$ levels of Li-like ions on the relative intensities of the resonance-line satellite structures of He-like ions. (10 refs.)
- 60910 Projectile-charge dependence of quasi-free-electron bremsstrahlung.** K. Ishii, K. Sera (Cyclotron & Radioisotope Center, Tohoku Univ., Sendai, Japan), H. Arai, S. Morita, K. Tokuda. *Phys. Rev. A (USA)*, vol.27, no.4, p.2225-8 (April 1983). Continuum X-rays induced by bombardments of a Be target with 20.14-MeV/amu protons and $^3He^{2+}$ ions have been measured with a Si(Li) detector in the direction of 90° with respect to the incident beam. Differences in the X-ray-production cross sections multiplied by the X-ray energy $\hbar\omega/\hbar\omega_0(\hbar\omega)/[4-\sigma_p(\hbar\omega)]$, and ratio of the cross sections $R(\hbar\omega) \equiv [\sigma_{He}(\hbar\omega)/4\sigma_p(\hbar\omega)]$ for the proton and $^3He^{2+}$ -ion impact, where $\sigma_p(\hbar\omega)$ and $\sigma_{He}(\hbar\omega)$ are the X-ray-production cross sections for proton and $^3He^{2+}$ -ion impact, respectively, were obtained as a function of the X-ray energy. Both the difference and the ratio show peaks in the region where the X-ray energy is equal to the relative kinetic energy between the projectile and the inner-shell electron to be scattered by the projectile. From the comparison with a theory of quasi-free-electron bremsstrahlung based on the impulse approximation it is found that this peak corresponds to the maximum of the velocity-distribution function of the inner-shell electron. Furthermore, the contribution of the radiative electron-capture process in the case of proton and $^3He^{2+}$ impact is clearly found. (5 refs.)

34.50E Rotational and vibrational energy transfer

60911 Experimental and theoretical study of the vibrational relaxation of $\text{CO}(\nu=1)$ and $\text{N}_2(\nu=1)$: V-T relaxation by the isotopes of helium. M.M. Maricq, E.A. Gregory, C.T. Wickham-Jones, D.J. Cartwright, C.J.S.M. Simpson (Phys. Chem. Lab., Oxford Univ., Oxford, England). *Chem. Phys. (Netherlands)*, vol.75, no.3, p.347-70 (15 March 1983).

Experimental results are reported for the rate constants for the vibrational relaxation of $\text{CO}(\nu=1)$, $^{14}\text{N}_2(\nu=1)$ and $^{15}\text{N}_2(\nu=1)$ by ^3He and ^4He in the temperature range from 300-80K. These are compared to rate constants determined from the numerical solution of the quantum scattering equations. The infinite-order sudden approximation can be used to reduce the number of coupled channels to those required for the vibrational levels. The calculations are applied to ab initio potentials and a model based on the anisotropic Morse potential. The major features which govern the rate of vibrational deactivation are shown to be the energy of the vibrational quantum, the mass of the collision partner and the steepness of the repulsive part of the intermolecular potential. Including an attractive well in the potential preferentially increases the relaxation rate constants at low temperatures. The roles of the attractive terms and the anisotropy of the potential in the deviations of the experimental data from the Landau-Teller predictions are discussed. (45 refs.)

60912 Intramolecular vibrational relaxation in the dual-channel 5-methyl-3-hexyl radical system excited by different activation pathways. S.P. Wrigley, K.W. Smith, B.S. Rabinovitch (Dept. of Chem., Univ. of Washington, Seattle, WA, USA).

Chem. Phys. (Netherlands), vol.75, no.3, p.453-62 (15 March 1983).

The study of the rate of vibrational energy relaxation in chemically activated systems has been extended to the competitive channel decomposition of 5-methyl-3-hexyl radicals activated to the average level of $\approx 44 \text{ kcal mol}^{-1}$ over the range of H_2 bath gas pressures from 1 to 46500 Torr at 298K. Two activation pathways were used. One is addition of H atoms to cis-5-methyl-2-hexene. Preferential decomposition of the initially formed, internally nonrandomized 5-methyl-3-hexyl radical occurs on a picosecond time scale to produce 4-methyl-1-pentene product. Formation of 1-butene product by the second decomposition channel has its onset only after internal randomization of the energy which was initially deposited by the activation reaction has occurred. By contrast, activation of 5-methyl-3-hexyl by addition of H atoms to trans-2-methyl-3-hexene should not, and does not give rise to initial formation of 4-methyl-1-pentene at short times. Instead, 1-butene is formed preferentially, as is expected for this mode of production of the initially nonrandomized state. From the pressure dependence of the product ratios, relaxation times in the range 0.1-0.6 ps are obtained, given plausible extremes of alternative assumptions about the size of the initially excited subset of vibrations. The percentage of mode-specified chemistry (nonrandom decomposition) is $10^{-4}\%$ in these systems in contrast to some of the author's earlier work where this percentage reached 2-10%. (24 refs.)

60913 Ground state vibrational randomization in alkylbenzenes. J.B. Hopkins, P.R.R. Langridge-Smith, R.E. Smalley (Dept. of Chem., Rice Univ., Houston, TX, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3410-14 (15 March 1983).

Measurements of intramolecular vibrational randomization (IVR) previously carried out on the S_1 excited state of a series of jet-cooled alkylbenzenes have been extended to the ground electronic state. The ground state ring modes $6b_1$, 1, and 12 were conveniently activated by pulsed laser excitation of the 0_0^0 vibronic band of the $S_1 \leftarrow S_0$ ultraviolet absorption system, followed by fluorescence. The onset of IVR was then probed by resonant two-photon ionization (R2PI) of these vibrationally activated ground state alkylbenzenes. When the alkyl chain exceeded three carbon atoms in length, the hot band 12_1^0 ($E_v \approx 1010 \text{ cm}^{-1}$) was found to be absent from the R2PI-probed spectrum, while the $6b_1^0$ hot band ($E_v \approx 625 \text{ cm}^{-1}$) remained easily observable through n-pentylbenzene. This overall pattern of IVR is essentially the same as that observed previously in the S_1 excited state. In both electronic states, the only effective barrier to vibrational energy decay from the ring to the chain appears to be an inadequate density of states. Above the critical state density, IVR appears to be complete, and this critical state density appears to be about the same in both the ground and excited electronic states. (18 refs.)

60914 Vibrational predissociation and intramolecular vibrational relaxation in electronically excited s-tetrazine-argon van der Waals complex. D.V. Brumbaugh, J.E. Kenny, D.H. Levy (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3415-34 (15 March 1983).

The van der Waals complex tetrazine-argon formed in a supersonic expansion has been investigated by means of laser-induced excitation and fluorescence spectroscopy. Excitation spectra reveal the band shift $D_0^0 - D_0^0 = -23 \text{ cm}^{-1}$, the tetrazine-argon stretch frequency $\nu_{\text{as}} = 44 \text{ cm}^{-1}$, and a lower limit to the dissociation energy $D_0^0 > 254 \text{ cm}^{-1}$. The band shift is vibrationally dependent in the case of two low frequency out-of-plane modes of tetrazine. The absence of additional broadening of the excitation linewidths due to the presence of argon shows that the dynamical processes in the complex are slower than the photodissociation of tetrazine itself (0.5-1.4 ns) which serves as an internal timing mechanism. At five single vibronic levels of tetrazine-argon above the S_1 zero-point level, the rates of vibrational predissociation and intramolecular vibrational relaxation are $\sim 10^8 \text{ s}^{-1}$. The V-V propensities in dissociation and relaxation are selective and different from collision-induced propensities. Among the V-V channels in dissociation, the authors find the lowest upper limit to D_0^0 is 381 cm^{-1} . Considerable rotational excitation of the tetrazine fragment is observed following dissociation which may reduce the estimate of D_0^0 to as low as 306 cm^{-1} . Although redistribution of vibrational energy during dissociation is selective, no mode selective effects could be attributed to the initial level of excitation, despite variations in the energy gap, number of quanta, total energy, or the dynamics of the vibrational motion. The van der Waals potential is virtually identical in the two electronic states. (42 refs.)

60915 Intramolecular vibrational relaxation: effects on electronic nonradiative relaxation rates. M.D. Morse, A.C. Pui, R.E. Smalley (Dept. of Chem., Rice Univ., Houston, TX, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3435-44 (15 March 1983).

The effects of intramolecular vibrational relaxation (IVR) on radiationless transition rates are investigated. IVR has previously been suggested as an explanation of the observed saturation of the decay rate in tetrazene $S_1 \leftarrow S_0$ internal conversion and in toluene $T_1 \leftarrow S_0$ intersystem crossing at high vibrational energies. Explicit calculations for transition rates under weak coupling in the statistical limit are presented which demonstrate that when IVR is operative a slow exponential increase of the nonradiative decay rate with vibrational energy is expected, in contrast to the experimentally observed rapid increase followed by saturation at higher vibrational energies. Speculations of alternative decay mechanisms are presented, and new, simple approximate formulas are derived for the relative nonradiative decay rates of single vibronic levels. (43 refs.)

60916 Transfer of state multipoles in open shell molecule-open shell molecule scattering. B.J. Whitaker, A.J. McCaffery (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3857-68 (15 March 1983).

General expressions are derived for the transfer of state multipoles in open shell polyatomic-open shell polyatomic rotationally inelastic collisions. These are then used to write expressions for the circular polarizations of spin and rotationally resolved spectral emission lines. Using the distorted wave Born approximation (DWBA), circular polarization ratios are calculated for the specific case of inelastic $\text{H} + \text{NH}_2$ collisions. The potential is decomposed into a spin-dependent term and an exchange term using tensor methods to facilitate the calculation. Alternatively, the scattering may be considered to take place on singlet or triplet surfaces. An interesting feature of the results is that rotation appears to be faster on the triplet surface than on the singlet. (25 refs.)

60917 Vibrational relaxation of gaseous $\text{CO}(\nu=1)$ and $\text{N}_2(\nu=1)$ from 300K to liquid temperatures: a comparison with liquid state relaxation. E.A. Gregory, M. Maricq, R.M. Siddles, C.T. Wickham-Jones, C.J.S.M. Simpson (Phys. Chem. Lab., Univ. of Oxford, Oxford, England).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3881-92 (15 March 1983).

The V-V energy transfer rate constants are reported for the deactivation of both $\text{CO}(\nu=1)$ and $\text{N}_2(\nu=1)$ by O_2 and CH_4 in the temperature range 300 to 80K. The results are obtained by an infrared fluorescence technique. In order to study the relaxation of $\text{N}_2(\nu=1)$, a small amount of CO is added to the gas mixture to function both as a pump and a probe. The probability vs. temperature curves are approximately parallel for the deactivation of $\text{CO}(\nu=1)$ as compared to the $\text{N}_2(\nu=1)$. This temperature dependence is found to resemble that for the V-T deactivation of CO at low temperatures. This is due to the large mismatch for these V-V energy transfer processes. The rate constants at liquid N_2 temperatures are compared with rate constants measured by other researchers for relaxation of the same systems in the liquid phase. The results show that the relaxation rate constants, expressed in terms of $\text{cm}^3 \text{ s}^{-1} \text{ molecule}^{-1}$, are approximately equal in the two phases. The implications of this result with respect to the cell and statistical models of vibrational relaxation in liquids is discussed. (56 refs.)

60918 Fast and exceptionally slow vibrational energy transfer in acetylene and phenylacetylene in solution. W. Zinth, C. Kolmeder, B. Benna, A. Irgens-Defregger, S.F. Fischer, W. Kaiser (Phys. Dept., Tech. Univ. Munchen, Munchen, Germany).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3916-21 (15 March 1983).

The excitation of the CH-stretching mode (ν_3) of C_2H_2 in CCl_4 leads to fast population ($< 2 \text{ ps}$) and very slow depopulation (240 ps) of the symmetric CC-stretching mode (ν_2). The long lifetime of ν_2 is due to the absence of anharmonic interaction to neighboring states (symmetry forbidden). The corresponding CC-stretching mode of $\text{C}_6\text{H}_5\text{-C}_2\text{H}$ has a lifetime of 15 ps. The phenyl group relaxes the symmetry restrictions and introduces new decay channels. (9 refs.)

60919 Very low energy collision induced vibrational relaxation of $^1\text{A}_g$ glyoxal. C. Jouve, M. Sulkes, S.A. Rice (Dept. of Chem. & James Franck Inst., Univ. of Chicago, Chicago, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3935-41 (15 March 1983).

The authors report the results of a study of very low energy collision induced vibrational relaxation of $^1\text{A}_g$ glyoxal. The effective collision energy is found to be different from different initial vibronic states, and the final states populated are drawn from a small subset of all available final states. The observed pathways of relaxation are interpreted using a previously proposed orbiting resonance model for the He: glyoxal collisions. It is inferred that (i) single collision-single quantum transfers dominate the relaxation process, and (ii) when there are near degeneracies in the vibrational manifold the lowering of symmetry in the orbiting resonance can permit mode mixing that is prohibited in the isolated molecule. (12 refs.)

60920 Vibrational energy transfer in atom-polyatomic collisions: the role of intramolecular dynamics in Li^+/CO_2 and $\text{Li}^+/\text{N}_2\text{O}$. E. Viallonga, D.A. Micha (Dept. of Chem. & Phys., Univ. of Florida, Gainesville, FL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3942-51 (15 March 1983).

Using a quantum many-body theory of hyperthermal atom-polyatomic collisions, the authors present a detailed study of the role of intramolecular dynamics in vibrational energy transfer. In this approach, differential vibrational cross sections are given by time-correlation functions (TCFs) of the motions of the target atoms. Slow rotations of polyatomic molecules are decoupled from vibrations, and the authors concentrate on vibrational energy transfer. The dependence of the TCFs on collision energy, scattering angle, and changes in vibrational quantum numbers is examined in detail for a general polyatomic, and it is shown how each target atom contributes to vibrational energy transfer. For the systems Li^+/CO_2 and $\text{Li}^+/\text{N}_2\text{O}$, they present vibrational differential cross sections calculated with new multicenter short-range potentials obtained from the uniform electron-gas model. Comparison of theoretical results with experimental measurements of the Li^+/CO_2 system shows good agreement for several collision energies and scattering angles. Furthermore, they show how the structure of the vibrational cross section is related to the atomic parameters of the target and to the relative sizes of the repulsive cores of the intermolecular potential. (33 refs.)

60921 Collision dynamical information from pressure broadening measurements: Application to carbon monoxide. J.J. Del Bruno (Dept. of Chem., Princeton Univ., Princeton, NJ, USA), J. Gelfand, H. Rabitz.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3990-8 (15 March 1983).

Self- and helium-broadened carbon monoxide linewidths have been inverted to obtain state-to-state rate constants using the energy corrected sudden scaling formalism. Selected rotation-rotation and rotation-translation rate constants are discussed as a function of vibrational and rotational levels for the CO-CO and He-CO systems. The authors find that there is no dependence of the collision dynamics upon the vibrational state of the collision partners up to $v=3$. In addition, relaxation in both these systems is found to be dominated by rotation-translation collisions. However they are qualitatively different in their dynamical characteristics and result in significantly varied state-to-state rate constants. An analysis of the effect of collision partners in the CO-X ($\text{X} = \text{CO}, \text{He}, \text{Ne}, \text{Ar}, \text{Xe}, \text{H}_2$) system is presented. Comparisons are made with the available data in the literature. (26 refs.)

60922 State resolved rotational excitation in HD+D₂ collisions. II. Angular dependence of 0-2 transitions. U. Buck, F. Huisken, G. Maneke (Max-Planck-Inst. fur Stromungsforschung, Gottingen, Germany), J. Schaefer.

J. Chem. Phys. (USA), vol.78, no.7, p.4430-8 (1 April 1983).

For pt.1 see ibid., vol.74, no.1, p.535, 1981. Time-of-flight spectra for the scattering of HD molecules from D₂ molecules have been measured at a collision energy of $E = 70.3 \text{ meV}$ over a range of center-of-mass scattering angles from 45° to 158° . The spectra reveal clearly resolved transitions at the energy loss $\Delta E = 33 \text{ meV}$ which corresponds to 0-2 transitions of HD and the double transition 0-1 of HD and 0-2 of D₂. The differential cross

sections derived from these spectra increase with increasing scattering angle from 1.7% to 34.7% of the elastic cross section. The pure 0-2 transition of D_2 which only needs 22 meV to be induced could not be detected within the experimental sensitivity of $0.02 \text{ \AA}^2/\text{sr}$. Closed coupled calculations based on the ab initio potential surface of Meyer and Schaefer show that this result can be explained by the different coupling terms which are responsible for these transitions. In contrast to the 0-1 transition the 0-2 transition of HD proved to be sensitive to the anisotropic part of the interaction potential for the homonuclear system. The comparison of experimental and calculated cross sections for the ab initio potential of Meyer and Schaefer reveals discrepancies for the 0-1 transition of HD, but shows agreement for the 0-2 transition of HD at intermediate angles. (28 refs.)

60923 State resolved rotational excitation in D_2+H_2 collisions. U.Buck, F.Huisken, A.Kohlhase, D.Otten (Max-Planck-Inst. für Stromungsforschung, Göttingen, Germany), J.Schaefer.

J. Chem. Phys. (USA), vol.78, no.7, p.4439-50 (1 April 1983). In a crossed molecular beam experiment time-of-flight distributions of ortho D_2 molecules scattered from normal H_2 (nH_2) and para H_2 (pH_2) have been measured in a center-of-mass angular range of 75° to 180° . The collision energies were 84.1 and 87.2 meV, respectively. In all spectra the rotational excitation of D_2 from $j=0$ to $j=2$ has been resolved. With pH_2 as secondary beam the same transition could also be observed for H_2 . The measurements show that the probability for rotational excitation of D_2 depends on whether the scattering partner H_2 is rotating (nH_2) or not (pH_2). In the first case the cross sections are larger by a factor of approximately 2. The reason for this behaviour is the presence of an additional interaction term which is at long range distances, identical to the quadrupole-quadrupole interaction and which is absent if H_2 is in the $j=0$ state. The experimentally derived differential cross sections for the rotational excitation of D_2 and H_2 are compared with theoretical results obtained by close coupling calculations based on the ab initio potential surface of Meyer and Schaefer. The comparison shows a remarkable agreement. However, small deviations in the positions of the diffraction oscillations of the elastic differential cross section curve suggest that the isotropic potential term has to be shifted to smaller distances. In order to maintain the relative position of the inelastic differential cross section curves which are well predicted by the ab initio potential the same shift has to be applied to the anisotropic potential terms. (39 refs.)

60924 Rotational relaxation of HF in a free-jet expansion of dilute HF-He mixtures: information content on state-to-state rate constants. T.E.Gough (Univ. of Waterloo, Waterloo, Ontario, Canada), R.E.Miller.

J. Chem. Phys. (USA), vol.78, no.7, p.4486-93 (1 April 1983). An F-center laser-molecular beam spectroscopy has been used to provide detailed information concerning the translational and rotational relaxation resulting from the free-jet expansion of dilute mixtures of hydrogen fluoride in helium. The observed non-Boltzmann rotational state distributions are modeled using an empirical kinetic approach and are shown to contain information concerning the individual state-to-state rate constants for HF-He. (22 refs.)

60925 Quantum theory of vibrational, rotational, and translational energy exchange in collisions of polyatomic molecules. Application to methyl halides. A.Miklavc (Boris Kidric Inst. of Chem., Ljubljana, Yugoslavia).

J. Chem. Phys. (USA), vol.78, no.7, p.4502-14 (1 April 1983). The author derives a quantum theory of inter- and intramolecular transfer of vibrational, rotational, and translational energy in collisions of polyatomic molecules, in the case that short range forces between the collision partners are of prevailing importance. For this purpose, he first transforms the Hamiltonian into the form which enables him to eliminate the coordinates which are cyclic in the limit of zero range forces and can thus be expected to be approximately ignorable when forces are of short, but finite, range. Instead of six rotational and three translational coordinates one is then left with one single relevant generalized coordinate. The corresponding mass can easily be calculated; it depends on the usual reduced mass of the colliding molecules, on their moments of inertia, and on the geometry of the potential surface. The motion of the only relevant generalized coordinate is then quantized. To calculate the probabilities for the collision induced vibrational-rotational transitions, one can make use of any of a large number of the approximation schemes which have been developed in scattering theory. In the present work, the author uses the distorted wave expansion, for its simplicity and also because it leads, in the corresponding limit, directly to the results obtained recently by the semiclassical theory. As an application, he studies vibrational deactivation probabilities of methyl halides colliding with inert gases: He, Ne, Ar, Kr, and Xe. Calculations are performed for two intermolecular potentials: exponential repulsive and Morse potential. The results obtained by the two potentials are very similar and agree well with the measured vibrational transition probabilities. (33 refs.)

60926 A theoretical study on the mechanism of electronic to vibrational energy transfer in $Hg(^3P)+CO$ collisions. S.Kato (Inst. for Molecular Sci., Okazaki, Japan), R.L.Jaffe, A.Komornicki, K.Morokuma.

J. Chem. Phys. (USA), vol.78, no.7, p.4567-80 (1 April 1983). The mechanism of electronic-to-vibrational ($E-V$) energy transfer in $Hg(^3P)+CO$ collisions has been studied theoretically. The configuration interaction (CI) method was employed to calculate potential energy surfaces of the collision system. A simplified theoretical model, based on the reaction coordinate concept and the calculated potential energy characteristics, was used to discuss the mechanism of the singlet-triplet transition and the energy disposal in the collision. The results obtained were that: (a) the quenching process proceeds via a collision complex mechanism; and that (b) the triplet-singlet transition occurs near the collinear geometry. A model classical trajectory calculation gives a product CO vibrational distribution in good agreement with the experimental result. (31 refs.)

60927 Ion energy-loss spectroscopy for the collisions of $Kr^+(^2P_{1/2})$ with N_2 , CO, NO and O_2 . Y.Itoh, T.Nakamura, N.Kobayashi, Y.Kaneko (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1091-4 (April 1983). Ion energy-loss spectra for 1308 eV $Kr^+(^2P_{1/2})$ incident on N_2 , CO, NO and O_2 were measured. For all molecules, fine-structure transitions between different J states of the projectile and vibrational excitations of the molecules were observed. In the case of N_2 and NO, the spectra were relatively simple and only the excitations of fundamental vibrations were found. For CO and O_2 , the excitations of the harmonics, $v=0-2$, were also observed. In addition to these, for CO, the peak due to the process, $Kr^+(^2P_{1/2})+CO(\Sigma, v=0) \rightarrow Kr^+(^2P_{3/2})+CO(\Sigma, v=1)$, was found. For O_2 , the peak due to the electronic excitation in the target, $^3\Sigma \rightarrow ^1\Delta$, was observed as well as the prominent peak corresponding to the process, $Kr^+(^2P_{1/2})+O_2(\Sigma, v=0) \rightarrow Kr^+(^2P_{3/2})+O_2(\Delta, v=0)$.

60928 Laser-induced fluorescence studies of vibrational and rotational relaxation in a supersonic molecular beam of bromine monochloride. J.W.Farthing, I.W.Fletcher, J.C.Whitehead (Dept. of Chem., Univ. of Manchester, Manchester, England).

Mol. Phys. (GB), vol.48, no.5, p.1067-73 (10 April 1983). Using time-of-flight and laser-induced fluorescence methods, the efficiencies of rotational and vibrational relaxation of BrCl by Cl_2 have been studied by measuring the final translational, rotational and vibrational temperatures of a supersonic beam of BrCl seeded in Cl_2 . Collision numbers, $Z_R \sim 1$ and $Z_V \sim 28$, have been obtained. Rotational relaxation is found to occur at a rate close to gas kinetic. Vibrational relaxation appears to be very efficient at the low temperatures of the beam and this is attributed to additional relaxation being achieved due to the formation of metastable orbiting complexes. (26 refs.)

60929 Collisional depopulation of Na ns states by H_2 and CO. T.F.Gallagher, K.A.Safinya, G.A.Ruff (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2222-4 (April 1983). The authors report the measurement of the depopulation cross sections of the Na ns states from $n=5$ to 11 by H_2 and CO, using a time- and wavelength-resolved fluorescence approach. The cross sections rise to a plateau value of 60 and 160 \AA for H_2 and CO, respectively. The increased size of the cross sections relative to those for the rare gases is attributed to energy transfer to molecular vibration. (11 refs.)

60930 Study of rotational transfer by collision in diatomic molecules. J.Derouard, J.Dufayard (Lab. de Spectrometrie Phys., Univ. Sci. et Medicales de Grenoble, Grenoble, France), O.Nedelec, N.Sadeghi.

Rev. Cethedec (France), vol.19, no.NS82-2, p.113-41 (1982). In French. The laser induced fluorescence technique has been used for studying angular momentum transfer in diatomic molecules upon collisions with various partners. Two types of molecules have been studied, which provide complementary information concerning the different aspects of the process: first diatomic hydrides $BH^+(A \text{ } ^1\Pi)$ and $COH^+(A \text{ } ^2\Pi_{1/2})$ colliding with He, Ar and H_2 , then iodine molecule $I_2^+(B_0, ^+)$ colliding with He, Ne, Ar, and I_2 . In the first case it has been found that the rotational transfer rates depend strongly on the symmetry of the levels involved; this is explained within the first Born approximation as resulting from the symmetry of the electronic state of the hydride considered. In the case of I_2 , a large number of transfer rates have been measured in order to determine whether ECS scaling laws (Brunner et al., 1981) are justified. In fact, the I_2+He transfer rates show an exponentially declining behaviour as a function of the exchanged angular momentum; on the contrary in the other cases, I_2+Ne , Ar or I_2 , one observes the usual inverse power scaling law in Δj . Three parameters are sufficient in each case to reproduce all the measured rotational transfer rates. Also collisional de-excitation rates have been determined. (31 refs.)

60931 Diffusion description of vibrational relaxation in a binary mixture of diatomic molecules (Harmonic oscillators). V.M.Volokhov, O.V.Skrebkov (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).

Theor. & Exp. Chem. (USA), vol.18, no.2, p.111-17 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.2, p.131-8 (March-April 1982). [received: Feb. 1983]. The authors show how one can apply the formalism of classical diffusion theory to the vibrational relaxation of diatomic molecules in order to use models for harmonic and quasiharmonic oscillators (anharmonic one-mode oscillators) to allow for the effects of multiquantum transitions. 60932 Experimental observation of the intercollisional interference effect on the S_1 pure rotation line of the collision induced spectra of the H_2 -He mixture. G.Bachet (Lab. des Interactions Atomiques et Moléculaires, Marseille, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.5, p.325-8 (7 Feb. 1983). In French.

The absorption coefficients of the collision induced spectrum of the interaction H_2 -He at 300K between 200 and 700 cm^{-1} are presented. A lack of absorption (dip) due to the intercollisional interference effect is clearly seen at the frequency of the pure rotation line S_1 of the free molecule of H_2 . (15 refs.)

60933 Recent developments in accelerator based atomic physics. S.Datz (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.881-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Much progress toward a detailed understanding of atomic collision phenomena and atomic structure has recently been made with the aid of accelerated ion beams. Beams foil Lamb shift measurements and the possible observation of spontaneously created positrons from quasi-superheavy atoms give promise for critical tests of QED. The mechanisms of inner-shell ionization and charge transfer in ion atom collisions have been intensively investigated and the results have brought together the various approaches—Coulomb excitation and MO treatments for these processes. That violent collisions at high energies can cause multiple ionization of the target atom has been known for some time. However, only recently have theoretical treatments been able to predict, e.g. the degree of L shell ionization accompanying K shell ionization. The highly charged ions formed in these collisions have themselves come under intensive investigation and are used for the study of the structure and collision physics of multiply charged species. Electro-Ion collision studies have also been started and initial results on dielectronic recombination are reported. (27 refs.)

60934 Simultaneous electron capture and excitation in ion-atom collisions. J.A.Tanis, E.M.Bernstein (Western Michigan Univ., Kalamazoo, MI, USA), W.G.Graham, M.Clark, S.M.Shafroth, B.M.Johnson, K.Jones, M.Meron.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.898-901 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A review of recent efforts to observe simultaneous electron capture-and-K-shell excitation in ion-atom collisions is presented. This process which has been referred to as resonant-transfer-and-excitation (RTE), is qualitatively analogous to dielectronic recombination (inverse Auger transition) in free-electron-ion collisions, and hence, is expected to be resonant. Experimentally, events having the correct signature for simultaneous capture-and-excitation are isolated by detecting projectile K X-rays in coincidence with ions which capture a single electron. In a recent experiment involving 70-160 MeV S^{3+} ions incident on Ar, a maximum was observed in the yield of projectile K X-rays associated with electron capture. This maximum is attributed to simultaneous capture- and excitation. The position (120 MeV) and width (60 MeV) of the observed maximum are in good agreement with theoretical calculations. The data indicate that RTE is an important mechanism for inner-shell vacancy production in the energy range studied. (10 refs.)

60935 Electron capture in M-shell X-ray production from heavy elements by 25- and 35-MeV fluorine ions. R.Mehta, J.L.Duggan, F.D.McDaniel, M.C.Andrews (Dept. of Phys., North Texas State Univ., Denton, TX, USA), G.Lapicki, P.D.Miller, L.A.Rayburn, A.R.Zander.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.906-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

M-shell X-ray production cross sections have been measured for thin solid targets ($\sim 2 \mu g/cm^2$) of Au, Pb, Bi, and U for 25 and 35 MeV incident F^{9+} ions ($q=4, 5, 6, 8, 9$). The target M-shell X-ray production cross sections by projectiles with one or two K-shell vacancies are found to be enhanced over those by projectiles without K-shell vacancies. The cross sections averaged over target thickness were measured as a function of target thicknesses. Electron capture (EC) to the L-, M-, ... shells and EC to the K-shell of the projectile, have been extracted from the data. (11 refs.)

60936 Mechanisms for rapid electron transfer in ionic solids following multiple ionization by heavy-ion impact. R.L.Watson, O.Benka, K.Parthasaradhi, R.A.Kenefick, R.J.Maurer, J.M.Sanders, B.Bandong, T.Ritter (Cyclotron Inst., Texas A&M Univ., College Station, TX, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.919-22 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Systematic measurements of the spectra of fluorine K α X-rays produced by the bombardment of alkali and alkaline earth fluorides with 2-MeV/amu ions ranging from He to Ar have given new information on the mechanisms for rapid electron transfer within the K-hole lifetime ($\sim 10^{-13}$ sec.). Spectra obtained with He ions provide clear evidence of the occurrence of resonant electron transfer (RET) following $1s_{2p}$ ionization of F^- in the compounds KF and SrF $_2$. Calculations employing a point-charge model support the conclusion that the anomalously low KL X-ray satellite intensities observed for these two compounds are the result of a resonant exchange of an electron between the outermost p level of the metal ion and the 2p level of the fluorine ion. (10 refs.)

60937 Multiple ionization of atomic targets by proton impact. L.H.Toburen, R.D.DuBois (Pacific Northwest Lab., Richland, WA, USA), S.T.Manson.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.923-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The authors have combined experimental measurements of multiply charged ion production, doubly differential electron emission cross sections and Auger electron spectra produced in fast-proton noble-gas collisions with theoretical inner and outer shell ionization cross sections in an effort to provide a unified description of the ionization process. A detailed analysis is provided for 1.4 MeV proton ionization of krypton. They measured relative yields of Kr^{+2} and Kr^{+3} ions are in approximate agreement with the photoionization results of Krause and Carlson (1966). If one assumes nearly half of the 3d vacancies created in Kr are filled through multiple (3dNNN) Auger transitions, the M-subshell ionization cross sections that they derive from their Auger electron spectra are in good agreement with theoretical calculations. The measured absolute yields of Kr^{+2} and Kr^{+3} are, however, a factor of 2 smaller than those derived from the decay of inner shell vacancies. This discrepancy leads

the authors to believe that multiple ionization in the initial interaction is a significant contribution to the observed yields. (8 refs.)

60938 M-shell X-ray production cross sections for 19 elements in the range $Z=54-92$ by H^+ and He^{+2} ions from 300 keV to 40 MeV. R.Mehta, J.L.Duggan, F.D.McDaniel, P.M.Kocur, J.L.Price (Dept. of Phys., North Texas State Univ., Denton, TX, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.950-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Measurements performed over the last three decades at various laboratories are surveyed. The elements studied were Xe, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Yb, Hf, Ta, W, Pt, Au, Hg, Pb, Bi, and U. The projectile energies investigated range from 300 keV to 40 MeV for the protons and 250 keV to 2.5 MeV for He^+ ions. Also reported are the M-shell X-ray production cross sections of some rare-earth elements recently measured at NTSU. For these measurements the energy of incident H^+ and He^+ ions ranged from 0.25 to 2.5 MeV. The experimental data are compared to the M-shell ionization cross section predictions of first Born approximation. Comparison is also made with the theory by Brandt and Lapicki that goes beyond the first Born approximation. (24 refs.)

60939 Deuteron and alpha-induced K-shell ionization cross section ratios in the $Z=12-17$ region. J.S.Lopes (Dept. de Fisica, Faculdade de Ciencias, Univ. de Lisboa, Lisboa, Portugal), A.P.Jesus, M.F.da Silva.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.954-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Experimental deuteron- and alpha-induced K-shell ionization cross section ratios are presented for elements ranging from Mg to Cl ($Z=12-17$) in the incident energy range 0.2 to 0.45 MeV/u. The experimental ratios $R=\sigma_{\alpha}/\sigma_d$ are generally close but slightly higher than the theoretical ratios calculated according to the procedure of Brandt and Lapicki (1979); the largest differences occur for Al and Si where the experimental values are 15-20% too high. The experimental ratios show roughly the same dependence on reduced projectile velocity, $\xi=(v_1/v_K)(2/\eta_K)$, as the theoretical ones in the reduced incident velocity range used in the present work, $\xi=0.45$ to $\xi=1$. This is in opposition to the results previously obtained in the velocity range $\xi=0.25$ to $\xi=0.55$ for elements ranging from Ca to Cu ($Z=20-29$), where the observed ratios are rather independent of the reduced velocity. (10 refs.)

60940 Proton-induced K-vacancy production cross sections for Sc, Ti, V, Cr, Co, Ni, Cu, and Zn. M.D.Brown, D.G.Simons, D.J.Land, J.G.Brennan (Naval Surface Weapons Center, Silver Spring, MD, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.957-60 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Absolute K-shell X-ray-production cross sections have been measured for thin-foil targets of Sc, Ti, V, Cr, Co, Ni, Cu; and Zn for incident protons with energies from 500 to 2200 keV. In order to determine the X-ray production cross sections with high precision ($\approx 5\%$), particular care was necessary in the control of experimental conditions. The overall agreement of the proton-induced cross sections with recent data obtained by other workers generally is to within 10% and frequently is to within the 5% accuracy of the results. (7 refs.)

60941 Recent results on K-shell ionization by ion collisions. L.Avaldi, M.Milazzo, G.Trivisa (Istituto di Fisica Generale Applicata, Milano, Italy), I.V.Mitchell.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.961-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The experimental K-shell ionization cross sections of Cd, Sn, Te, I and Ba for alpha particles, between 2.2 MeV and 2.8 MeV, and of Te for protons, between 1.6 and 3 MeV, are presented. The justification for making these measurements comes, on the one hand, in filling a region where, at present, data are sparse (for example, Te ionization cross sections by alpha particles have never been reported before), and, on the other hand, checking between previously reported and diverging sets of experimental results. (10 refs.)

60942 L-subshell X-ray production cross sections of Ba, La and Ce for proton energies from 0.25 to 2.00 MeV. L.A.Rayburn (Dept. of Phys., Univ. of Texas, Arlington, TX, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.964-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Protons from the University of Texas at Arlington's 2 MV Van de Graaff accelerator were used to produce characteristic L X-rays from thin targets of Ba, La and Ce. The incident proton energy was varied from 0.25 to 2.00 MeV. The X-rays were detected by a detector mounted at 90° to the incident beam direction. Measured X-ray production cross sections were converted to ionization cross sections by the use of subshell fluorescence yields and Coster-Kronig transition probabilities taken from Bambynek (1972). Inflection points are found in the L_1 -subshell ionization cross section for all three elements. (14 refs.)

60943 Proton induced L-subshell ionization on silver and iodine. E.Rosato, P.Cuzzocrea, N.De Cesare, E.Perillo, G.Spadacini (Istituto di Fisica Sperimentale, Univ. di Napoli, Napoli, Italy).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.967-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

L-X-ray production cross sections were measured in the proton energy range 0.3-5.0 MeV for Ag and I. Subshell ionization cross sections were extracted and compared with predictions of the perturbed stationary state theory, the binary encounter approximation and the semiclassical approximation with binding, polarization, relativistic, energy loss and Coulomb deflection corrections included (ECPSSR, BEABC, SCABCR). The agreement is quite good especially for the shape and the magnitude of the kink in the L_1 subshell cross section due to the node of the $2s$ wavefunction. (22 refs.)

60944 L-shell ionization of gold by nitrogen ion impact. J.Palinkas, L.Sarkadi, B.Schlenk, I.Torok, Gy.Kalman (Inst. of Nuclear Res., Hungarian Acad. of Sci., Debrecen, Hungary), C.Bauer, K.Brakoff, D.Bramble, C.Heiser, W.Rudolph, H.J.Thomas.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.970-2 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Measuring the angular distributions and the absolute intensities of the L X-ray lines of gold at 2.4-18.2 MeV nitrogen ion impact, the absolute sub-shell ionization cross-sections and the alignment parameter of the L_2 -subshell have been determined and compared to the theoretical results. (14 refs.)

60945 Single and double ionization of He by fast light ions. L.H. Andersen (Univ. of Tennessee, Knoxville, TN, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.973-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The cross sections for single and double ionization of He by H, He, Li, B, C and O ions were measured. The ion velocity ranged from $\sim 2 v_0$ to $\sim 10 v_0$. The Bethe-Born results of Gillespie and Inokuti are found to be in good agreement with the data for single ionization at low projectile charges. The breakdown of the perturbation region is discussed and in the strong interaction region the experimental single ionization data are compared with results of Bohr and Janev. The double ionization data are presented and a theoretical estimate based on an independent electron model is discussed. (13 refs.)

60946 Recent progress in fast ion beam spectroscopy. E.J.Knystautas (Dept. de Phys., Univ. Laval, Quebec, Canada).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.987-90 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Considerable improvements in technique have recently led to greatly increased accuracy in the measurements of transition energies and lifetimes for excited states of highly stripped ions by beam-foil and beam-foil-laser spectroscopy. Such measurements for two-electron ions of high Z can now be used to determine relativistic and QED corrections for such systems to a few parts per thousand. The ion-foil interaction is now much better understood as a result of experiments which study the polarisation of the light emitted by the foil-excited beam. These and other developments in the field are discussed, including laser excitation, electron emission from the target, recoil ion spectroscopy in gases, and ion collisions with surfaces at glancing angles. (11 refs.)

60947 Vacancy-transfer cross sections and Li-vacancy lifetimes for low-energy collisions of Ar^{2+} with Mg, Al, and Si. S.J.Cipolla, M.Mildebrath (Phys. Dept., Creighton Univ., Omaha, NE, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.999-1001 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Electron promotion via rotational coupling of the $2p\pi=2p\sigma$ molecular orbitals in the quasimolecule formed during a near-symmetric collision between a heavy ion and a lighter target atom has successfully explained the K X-ray emission from the target atom. For atoms in a solid target, the target density fosters a double-collision mechanism whereby a fraction of the ion beam brings an L-shell vacancy into a subsequent collision with a target atom so that K-electron transfer from the target to the projectile can occur. On this basis the authors have performed a thick-target K-shell ionization analysis on target X-ray yields for 160-380 keV Ar^{2+} impinging on Mg, Al, and Si. The measurements yield the equilibrium L-vacancy fraction and the L-vacancy lifetime for the Ar^{2+} beam moving through these targets. (16 refs.)

60948 A study of transfer excitation in $\text{F}^{8+}+\text{He}$, Ne and Ar collisions. P.L.Pepmiller, P.Richard, J.Newcomb, R.Dillingham, J.M.Hall, T.J.Gray, M.Stockli (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1002-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

High resolution X-ray spectroscopy has been used to measure F K X-rays resulting from the decay of doubly excited two electron states formed during $\text{F}^{8+}+\text{He}$, Ne, or Ar collisions. The energy range spanned by the spectrometer includes the $2s2p(^3\text{P})-1s2s(^3\text{S})$, $2s2p(^1\text{P})-1s2s(^1\text{S})$, $2p^2(^3\text{D})-1s2p(^3\text{P})$, $2p^2(^1\text{D})-1s2p(^1\text{P})$ and the $2p^2(^3\text{S})-1s2p(^3\text{P})$ transitions. These states may be formed by nonresonant transfer excitation, in which electron excitation is coupled with electron capture to an excited state, or by resonant transfer excitation, a process related to dielectronic recombination, in which the capture of a loosely bound target electron results in projectile electron excitation. Calculations have been performed to estimate the contribution of each process to the total measured cross section. (9 refs.)

60949 Transfer ionization in slow multiply charged ion-atom collisions. A.S.Schlachter, W.Groh, A.Müller, E.Salzborn (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1008-11 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Transfer ionization, or exothermic capture ionization, is found to be an important reaction mechanism in slow multiply charged ion-atom collisions: more electrons are released from the target in creating a recoil ion than are found to be captured by the projectile when viewed long after the collision. These collisions generally depend upon the internal potential energy of the collision system rather than on the projectile kinetic energy. (18 refs.)

60950 Population of the 3s state in hydrogen due to H^+ , H_2^+ and H_3^+ impact on ethylene, 1-butene and cis-2-butene. D.H.Lloyd, H.R.Dawson (Dept. of Phys., Angelo State Univ., San Angelo, TX, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1012-14 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Absolute cross sections were measured for capture or dissociation into the 3s state of atomic hydrogen due to impact of 14-28 keV H^+ , H_2^+ and H_3^+ ions on ethylene, 1-butene and cis-2-butene. The cross sections obtained for the butene targets were almost identical and support the additive rule for cross sections. Ethylene cross sections were 21% lower than the values predicted by the additive rule, which agrees well with the observed trend toward reduction in total electron capture cross sections for protons on these gases at much higher energies. (27 refs.)

60951 Coherent K-ionization using a H_2^+ beam. Cheng-Ming Fou (Dept. of Phys., Univ. of Delaware, Newark, DE, USA), T.S.Fou.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1018-19 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A 1.0 MeV H_2^+ beam from the University of Delaware Van de Graaff accelerator was used to bombard a thin nickel target. Characteristic K X-ray from Ni was measured with a thin NaI(Tl) detector in coincidence with protons scattered into 90° and 165° lab angles. The energy of the protons detected in those angles corresponds to the elastic scattering of 0.5 MeV incident H^+ beam because of the negligible (2.65 eV) bound energy between H and proton in H_2^+ . However, the ionization probabilities measured in the 1 MeV H_2^+ beam case differ from that measured with a 0.5 MeV proton beam. While the ionization probability for the 165° scattering is increased with the H_2^+ beam, the reverse is true for the 90° scattering. Possible coherent effect is being considered. (4 refs.)

60952 Effects of a polarized wave function in calculations of inner-shell ionization probability. D.J.Land, G.Basbas, M.D.Brown, D.G.Simons (Naval Surface Weapons Center, Silver Spring, MD, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1103-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Theoretical calculations for the proton-induced K-shell ionization probability in which the ground-state electron wave function is allowed to be polarized under the influence of the incident projectile are described. These calculations extend the results of a previous theoretical model in which the wave function is allowed only a spherically symmetric distortion. The model is based upon lowest-order perturbed-stationary-state theory. Comparisons between calculations performed with different wave functions as well as between calculations performed with the polarized wave function and experimental data are shown for 0.3 to 2.4 MeV protons in titanium. (10 refs.)

60953 Effects of a nuclear scattering resonance on bremsstrahlung production and K-shell ionization. C.C.Trail, P.M.S.Lesser, M.K.Liou (Brooklyn Coll., City Univ. of New York, New York, NY, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1124-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

While the effects of nuclear resonances on nuclear bremsstrahlung emission have been the focus of current bremsstrahlung studies in nuclear physics, such effects on atomic K-shell ionization have attracted much attention recently. The authors review the recent developments of these two topics with the emphasis upon their common features. Special attention is given to the effect of the nuclear resonance near 461 keV in p^{12}C where experimental results are available for bremsstrahlung production and K-shell ionization. (17 refs.)

60954 Effective ionic radii of NO_2^- and SCN^- estimated in terms of the Botcher equation and the Lorentz-Lorenz equation. Y.Iwade, K.Kawamura (Res. Lab. for Nuclear Reactors, Tokyo Inst. of Technol., Tokyo, Japan), K.Igarashi, J.Mochinaga.

J. Phys. Chem. (USA), vol.86, no.26, p.5205-8 (23 Dec. 1982).

The electronic polarizabilities of NO_2^- and SCN^- ions have been estimated from the refractive index data by use of the Lorentz-Lorenz equation and the Botcher equation. The effective ionic radii of NO_2^- and SCN^- have been evaluated from the obtained electronic polarizabilities to be 1.77-1.81 Å (320°C) and 2.15-2.20 Å (300°C), respectively, by using the correlation between the third power of the ionic radius and the electronic polarizability of an ion and also taking into account the structure of the ion. It has been concluded that the Botcher equation does not hold good for molten ionic liquids such as NaNO_2 and LiSCN in the optical frequency region. (27 refs.)

60955 Determination of the Penning excitation cross sections of Mg atoms by He, Ne and Ar metastable atoms. S.Inaba (Dept. of Electrical Engng., Gifu Tech. Coll., Gifu, Japan), T.Goto, S.Hattori.

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1164-7 (April 1983).

The relative Penning excitation rates for the individual Mg(II) states by He(2S) atoms, by He(2S) atoms and by Ne(3P) atoms have been measured separately using Penning electron spectroscopy. The absolute values of the Penning excitation cross sections have been estimated by comparing the Penning electron energy spectrum for the Mg(II) ground state with that for the Zn(II) ground state. Using the same method, the Penning excitation cross section of Mg atoms by Ar(4P) atoms has been also estimated. (13 refs.)

60956 Experimental investigation of Hornbeck-Molnar ionisation in collisions between excited He(5P) and He atoms. A.Pesnelle, S.Runge, M.Perdrix, D.Sevin, G.Watel (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).

J. Phys. B (GB), vol.16, no.7, p.L193-9 (14 April 1983).

The dependence of the Hornbeck-Molnar ionisation cross section on the relative kinetic energy of the colliding partners $\text{He(5P)}_2 + \text{He}$ has been measured for the first time over the 0.015-0.40 eV range (1200-6000 m s^{-1}) in a crossed-beam experiment using a time-of-flight technique. The 5^1P level is obtained by optical excitation of the 2^3S metastable level at 294 nm; the CW radiation is generated by intracavity frequency doubling in a ring laser. The most striking feature of this cross section is a pronounced maximum which corroborates Cohen's approach for this type of ionisation in He^* ($n=3$ and 4) + He systems. (18 refs.)

60957 Formation of molecular ions in binary collisions of excited inert-gas atoms. A.Z.Devdariani, V.I.Demidov, N.B.Kolokolov, V.I.Rubtsov (A.A. Zhdanov State Univ., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.334-5 (July 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.772-5 (July 1982).

Binary collisions of excited atoms at thermal energies lead to the formation of both atomic ions (through Penning ionization) and molecular ions (through associative ionization). Extremely little information on the ratio Q_m of the rate constant for associative ionization to the total ionization constant has been obtained by the mass-spectroscopy method, and the results which have been obtained for a common subject of these studies, the reaction $\text{He(2S)}_2 + \text{He(2S)}$, differ by more than an order of magnitude. The new method of plasma electron spectroscopy which combines the possibility of arranging a high density of excited atoms in afterglow experiments with the possibilities of Penning electron spectroscopy, has been used to determine Q_m from experimental spectra for the reactions $\text{He(2S)}_2 + \text{He(2S)}$ and $\text{He(2S)}_2 + \text{He(2S)}$. 60958 Rotational rainbow scattering in collisions of Ar with Cl_2 . M.A.Hoffbauer, S.Burdenski, C.F.Giese, W.R.Gentry (Chem. Dynamics Lab., Univ. of Minnesota, Minneapolis, MN, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3832-7 (15 March 1983). The pulsed molecular beam technique has been used to measure speed and angle-resolved differential cross sections for scattering of Ar by Cl_2 , over the range of initial relative kinetic energies from 0.09 to 0.16 eV. Angular rainbows are observed at small scattering angles. At large scattering angles, the product speed distributions at constant center-of-mass scattering angles display rotational rainbow structure which corresponds to a large fraction of the initial relative kinetic energy appearing as rotational energy in the Cl_2 product. The large-angle data may be interpreted in terms of the classical rigid-ellipsoid model, which expresses the anisotropy of the potential energy surface with a single parameter. (21 refs.)

34.70 CHARGE TRANSFER

(see also 82.30 Charge transfer reactions)

60959 A new diabatic molecular representation for triplet-triplet transitions in $\text{He}^+ - \text{He}^*$ collisions. T.K.Rai Dasidhar (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA), K.Rai Dasidhar, R.Sen Gupta. *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.85-8 (25 March 1983). A 'frozen-orbital' diabatic basis has been constructed for an impact parameter treatment of collisions of He^+ with metastable $\text{He}(2^3\text{S})$ at 1000 eV laboratory ion energy. Except for the two highest states used, the diabatic states correlate very well with the separated-atom energies, and the $\Sigma - \Pi$ rotational couplings deviate little from the proper asymptotic behaviour ($\approx R^{-2}$). Cross sections and transition probabilities are presented for some elastic and inelastic channels. (10 refs.)

60960 Charge transfer to helium ions from metastable helium. P.Gangopadhyay, J.N.Bardsley (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.379-82 (8 April 1983). The cross section for charge transfer in $\text{He}^+ - \text{He}(2^3\text{S})$ collisions is calculated using the asymptotic theory of ion-atom interactions, including the effects of polarization and momentum transfer. The results agree well with recent measurements by the merged beam technique. (10 refs.)

60961 Luminescent charge transfer of ground-state and metastable B^+ ions. C.Ottinger, J.Reichmuth, M.Yang (Max-Planck-Inst. für Stromungsforschung Göttingen, Göttingen, Germany). *Chem. Phys. (Netherlands)*, vol.76, no.1, p.61-9 (1 April 1983). Endothermic charge-transfer reactions between $\text{B}^+(^1\text{S}$ and $^3\text{P})$ ions and several simple gases have been observed in a beam experiment at moderate and low energies. The products $\text{b}^+(\text{S}$ and $^2\text{D})$ were observed by means of their UV emission. Absolute cross sections for the four reaction channels were measured, ranging from 10^{-21} to 10^{-18} cm^2 . The relative cross sections depend markedly on the collision partner, and are discussed in terms of system symmetry and schematic energy diagrams. (12 refs.)

60962 Density functional estimates of charge transfer and chemical potentials in hydrogen halides and mixed halides. J.A.Alonso, N.H.March (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England). *Chem. Phys. (Netherlands)*, vol.76, no.1, p.121-4 (1 April 1983). A simple model, based on the principle of constant chemical potential, is used to calculate the charge transfer in hydrogen halides and mixed halide molecules. (22 refs.)

60963 Angular-dependent electron-capture probabilities. E.Horsdal-Pedersen, J.L.Rasmussen (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.891-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). The angular dependence of the electron capture probability for monoenergetic protons scattered off Ne atoms in fast binary encounters has been studied experimentally. A qualitative discussion of the physics of the angular dependence is presented and a simple model is developed which fits the experimental angular dependences well. (15 refs.)

60964 Electron capture cross sections for low velocity Ne^{q+} ($q=2, 3, 4, 5$, and 6) incident upon atomic hydrogen. T.J.Gray, C.Can, J.M.Hall, L.Tunnell (Kansas State Univ., Manhattan, KS, USA), Varghese, S.L. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.895-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). Measurements of electron capture cross sections for low velocity Ne^{q+} ions ($q=2, 3, 4, 5$ and 6) in collisions with atomic hydrogen are discussed. The Ne ions are obtained from a recoil ion source using a F^{4+} pump beam from the EN tandem accelerator. Time-of-flight techniques and post interaction electrostatic analysis provide for the experimental determination of the electron capture cross sections. Comparisons to the theories of Olson and Salop (1976) and Ryufuku et al. (1980) presented. (12 refs.)

60965 Electron capture to the continuum at asymptotically high velocities. S.D.Berry, I.A.Sellin, K.-O.Groeneveld, D.Hofmann, L.H.Andersen, M.Breinig, S.B.Elston, M.M.Schauer (Univ. of Tennessee, Knoxville, TN, USA), N.Stolterfoht, H.Schmidt-Bocking, G.Nolte, G.Schwiertz. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.902-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). The velocity distributions of electrons ejected from gaseous He targets into the forward direction by 15-18 au velocity bare O, Ne and Ar nuclei are measured. The shape of the resulting ECC (electron capture to be continuum) cusps is studied in detail by three fitting methods and compared to theory. The results favor theoretical treatments which include higher-order ejected electron partial waves to describe the observed asymmetry. (14 refs.)

60966 Additivity failure in electron capture from C-bearing molecules to continuum states of $\sim \text{MeV/u } \text{H}^+, \text{H}^{++}$ projectiles. J.Gaiser, J.M.Joyce, G.Bissinger (East Carolina Univ., Greenville, NC, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.909-10 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). The failure of additivity in electron capture from molecules to bound states (ECB) of projectiles has been measured sporadically for more than twenty years. However until now there has been no report of similar additivity measurements for electron capture to continuum states (ECC). The measurements reported here show that additivity of 'atomic' cross sections fails in ECC processes also. (5 refs.)

60967 Electron capture from C-bearing molecules to bound states of 0.8-3.0 MeV H^+ : additivity corrections using electron loss cross sections. J.M.Joyce, G.Bissinger (East Carolina Univ., Greenville, NC, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.911-12 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). Estimates of electron capture-to-bound-states (ECB) cross sections for molecular targets are normally made by assuming additivity of 'atomic' cross sections. This assumption leads to a familiar problem—it doesn't work. The authors have recently estimated the magnitude of ECB additivity failure observed in H^+ bombardment of hydrocarbon gases by assuming that additivity failure arises from intramolecular electron loss collisions that succeed the capture collision. Using capture-loss calculations adapted to molecules, additivity failure could be quite well accounted for in these terms. Here they apply the same basic approach but estimate additivity failure in a hard sphere geometric scattering model (GSM) that removes some of the inherent difficulties in capture-loss calculations pertaining to areal densities and molecular orientations. (5 refs.)

60968 Quasi-resonant K-K charge exchange in F-Ne collisions. S.Hagmann (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.928-30 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). K-K charge transfer has been identified as a major K-vacancy creating mechanism in near symmetric collisions systems by measuring either the projectile charge dependence of the target K-vacancy production or by high resolution study of the deexcitation processes after inner-shell vacancy production. The complexity of the simultaneous outershell excitation during a collision which creates a K vacancy requires that for a more systematic study a system be chosen which allows a more or less straightforward derivation of the K-vacancy probabilities from the observed decay of the excited state. An immediate candidate is the $\text{F}^{9+} - \text{Ne}$ system, which had been studied spectroscopically very extensively by Kauffman (1975) and Woods (1975) and who suggested that the K-vacancy production cross section could be extracted directly from the K-Auger cross sections because the fluorescence yield to be applied in the ionized case still is very small. (8 refs.)

60969 Production of 3s state hydrogen by H_2^+ impact on noble gases. M.L.Jones, B.M.Doughty (East Texas State Univ., Commerce, TX, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.996-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). Absolute cross sections are reported for the production of 3s atomic hydrogen by 20-150 keV H_2^+ ions incident on He, Kr, and Xe. These measurements were made with an established technique used previously at East Texas State University for proton charge transfer cross sections. This basic technique has also been used by laboratories at Georgia Tech. and the University of Arkansas to make additional H_2^+ measurements. Results from these three laboratories are in good agreement and when combined provide a relatively consistent set of 3s cross sections for the five rare gases from 20-700 keV. Excited hydrogen atoms may be formed through several reaction channels; this experimental technique does not identify the relative contributions of these channels to the total 3s production. The multiple features of these cross section curves indicate that the internal structure of the targets plays an important role in the dissociation mechanism and that detailed theoretical descriptions will be quite involved. (17 refs.)

60970 The strong potential approximation with non-orthogonality terms. J.H.McGuire (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1100-2 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). Non-orthogonality contributions are included in the strong potential approximation (SPA) for electron capture. These non-orthogonality contributions occur because the off-energy-shell Coulomb wave functions, representing the intermediate states of the collision, are not orthogonal to the initial bound state wave functions. As a result of this non-orthogonality an extra term arises in the matrix element between initial and intermediate states. This term may be written as an addition to the interaction potential which is treated in first order perturbation theory in the SPA method. It is shown that this nonorthogonality contribution is zero in the SPA when peaking approximations are applied. (6 refs.)

60971 Positive charge transfer in mixed alkane glasses. J.Cyglar, G.G.Teather, N.V.Klassen (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Canada). *J. Phys. Chem. (USA)*, vol.87, no.3, p.455-60 (3 Feb. 1983). Positive charge transfer between the initial cation and the solute has been reexamined in detail at 6 and 72K for 3-methylcyclohexane (3MO) glasses containing squalene (SQ). A good fit to the observed decay of the 3-methylcyclohexane cation (3MO^+) was obtained by using the tunneling expression. The binding energy calculated, $B=0.33 \text{ eV}$, does not agree with the electron tunneling model. The results are discussed in terms of alternate tunneling mechanisms. The positive charge transfer $3\text{MO}^+ + \text{SQ} \rightarrow 3\text{MO} + \text{SQ}^+$ was separated kinetically from all other reactions, and the ratio $\epsilon_{\text{max}}(\text{SQ}^+)/\epsilon_{\text{max}}(3\text{MO}^+)=1.6$ was calculated, in good agreement with an independent determination made by using pyrene (Py) as a cation scavenger. Positive charge transfer was also examined in several other mixed alkane systems. (30 refs.)

60972 Electron capture by multiple charged low energy ions in charge exchange collisions with atomic targets. S.Bluman, S.Dousson, B.Jacquot, D.Van Houtte (CENG, Grenoble, France). *J. Phys. (France)*, vol.44, no.4, p.467-72 (April 1983). Single and double electron capture cross sections for low velocity Ar^{q+} ions with initial charges $2 \leq q \leq 12$ colliding with gaseous targets (Kr and Xe) have been measured. In the considered energy range ($2 \text{ q-}10 \text{ keV}$) it is confirmed that the cross section of single electron capture is quasi energy independent. Comparisons of the actual results are made to theoretically calculated and to previously measured cross-sections. It is shown from the results that an experimental tendency is observed for $\sigma_{q,q-1}/\sigma_{q,q-2} \approx C/q/[IP]^2$ where q is the incident ion charge, IP the target ionization potential. (38 refs.)

60973 Effects of neutrino recoil on the X-ray emission of bound electron capture atoms. G.Brunner (Zentralinst. für Isotopen- und Strahlenforschung, Akad. der Wissenschaften, Leipzig, Germany). *J. Phys. B (GB)*, vol.16, no.7, p.1199-204 (14 April 1983). Due to neutrino emission during the capture process, the nucleus experiences a recoiling motion. If one assumes that those valence charge fractions which are localised, but also bound to ligands, cannot follow the nuclear and core motion immediately, a certain electron cloud deformation takes place besides the 'normal' static chemical polarisation. This gives rise to additional X-ray transitions from the valence band to 1s for K-electron capture. For intensity reasons in connection with radioactive sources the energy dispersive version of X-ray spectrometry is mostly applied and, therefore, a $K_{\beta\gamma}$ -type emission cannot be resolved, but it increases the relative (to K_{α}) K_{β} intensity and enhances the chemical sensitivity of the K_{β}/K_{α} ratio. Numerical estimates for the ^{51}Cr decay give up to 5% effects for the limiting case of absolutely fixed valence charge fractions. 'Kinetic polarisation' is proposed to explain some experimentally observable and analytically applicable aspects of the K_{β}/K_{α} ratio of electron capture (EC) nuclides. (14 refs.)

60974 The use of static potentials in atomic collisions. Application to the excitation of hydrogen atoms by helium ions at intermediate energies. J.M.Maidagan, R.D.Rivarola (Inst. de Física Rosario, Rosario, Argentina). *J. Phys. B (GB)*, vol.16, no.7, p.1211-23 (14 April 1983). A model based on the independent-electron approximation and the impact parameter formalism has been developed, in order to take into account the influence of passive electrons in collisions between multielectron ion(atom) projectiles and mono-electron ion (atom) targets, and where only the electron in the target is active. Differential cross sections for excitation to the $n=2$ states of hydrogen by He^+ impact, in the intermediate energy region, are calculated as an application of this model. A reasonable agreement with recent experimental data is obtained using a two-state atomic expansion. The negligible influence of the $\text{He}(1s, 2p_{\pm 1})$ capture state on the excitation processes has been determined. (13 refs.)

60975 Electronegativity equalization and electron transfer in molecules. L.C.Balbas, J.A.Alonso, E.Las Heras (Univ. de Valladolid, Valladolid, Spain). *Mol. Phys. (GB)*, vol.48, no.5, p.981-8 (10 April 1983). A simple model for the electron transfer in an XY molecule is considered in which the amount of charge transfer Q is determined by the condition of equality of the electronegativities of the components, that is $\phi_X(Q) = \phi_Y(-Q)$. To calculate Q , $\phi_i(Q)$ ($i=X, Y$) is expanded in powers of Q about $Q=0$. The coefficients of the powers of Q in this expansion have been calculated by a density functional pseudopotential method. (17 refs.)

60976 Ion-atom differential cross sections at intermediate energies. R.E.Olson (Phys. Dept., Univ. of Missouri, Rolla, MO, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.1871-8 (April 1983). The classical-trajectory Monte Carlo method has been used to calculate $\text{H}^+ + \text{H}(1s)$ electron-capture and ionization differential cross sections in the range 25-200 keV. The results indicate the importance of including excited product states to describe the small-angle electron-capture scattering. Angular scattering of the electron removed by the ionization process has been studied as a function of ejected-electron velocity v_e . The classical calculations are in reasonable agreement with coupled-channel results of Shakeshaft [Phys. Rev. A 18, 1930 (1978)] as to the 'electron capture to the continuum' (ECC) component of the ionization process where this term is defined as the ejected electron being more closely centered to the projectile than the target nucleus after the collision. The ECC cross section σ_{ECC} was studied as a function of collision energy (50-500 keV/amu) and projectile charge state ($q=1-10$). At high energies, σ_{ECC} scales as $q^{2.5}/E^{2.5}$. The maximum value for σ_{ECC} was determined to be an energy $E_{\text{max}} \approx (56 \text{ keV/amu})^{0.4}$. Restricting the ECC component to small electron-scattering angles, $\theta_{\text{lab}} \leq 5^\circ$, and electron-ejection velocities $v_e = v_p(1.0 \pm 0.1)$, where v_p is the projectile velocity, indicates this process is a minor component of the total ionization cross section at intermediate energies. (27 refs.)

60977 Charge exchange of C^{+6} and O^{+8} ions with hydrogen atoms: Strong coupling calculation. A.K.Kazanskii, I.V.Komarov. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1064-8 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1734-40 (Sept. 1982). [received: April 1983] A strong coupling method with an adiabatic assumption is used for calculating charge exchange of the C^{+6} and O^{+8} ions on $\text{H}(1s)$ hydrogen atoms for velocities in the interval $v=0.1-0.4$ a.u. The basis includes radial and rotational coupling of five states for C^{+6} and six states for O^{+8} . The total cross sections and the distributions of excited states over the principal quantum number in the C^{+5} and O^{+7} ion states are computed. (14 refs.)

34.80 ELECTRON SCATTERING

60978 Studies of some iron dithiolate complexes by the ESCA, Mossbauer and extended Huckel methods. J.Blomquist, U.Helgeson (Inst. of Phys., Univ. of Stockholm, Stockholm, Sweden), B.Folkesson, R.Larsson. *Chem. Phys. (Netherlands)*, vol.76, no.1, p.71-8 (1 April 1983). Iron dithiolate complexes have been studied by Mossbauer and ESCA spectroscopy. Atomic charges and iron atom populations have been evaluated. Molecular orbital calculations have been made using the iterative extended Huckel method. The theoretical results are compared with the experimentally obtained charge distributions. (19 refs.)

60979 Scavenging probability of a geminate pair in the presence of an external electric field. Application of the method of matched perturbation solutions. H.Sano (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan). *J. Chem. Phys. (USA)*, vol.78, no.7, p.4423-9 (1 April 1983). An analytical expression for the scavenging probability of a geminate pair interacting with a general potential in the presence of an external electric field is derived for both small scavenger concentrations and small field strengths. The derivation is based on the method of matched perturbation solutions of the differential equation satisfied by the recombination probability. The expression includes as an integral part the rate constant observed for reaction of the geminate partners in the bulk. Agreement of the expression with the exact ones is found when it is applied to ion recombination and recombination of the electron photodetached from an anion. (35 refs.)

60980 Photoabsorption and electron yields of La and Gd in the vicinity of the 3d thresholds. J.M.Esteve (Univ. Paris-Sud, Orsay, France), R.C.Karnatak, J.P.Connerade. *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.31, no.1, p.1-12 (April 1983).

A comparative study of the 3d photoabsorption and electron-yield spectra of La and Gd using synchrotron radiation emitted by the Orsay storage ring (ACO) is presented. The effects of sample thickness on each kind of spectrum are discussed. The mean sampling depths for La and Gd are determined from the variations in intensity of the main excitation lines as a function of film thickness in the yield spectra. The advantages and potential of the yield technique for the study of lanthanide spectra are pointed out. (29 refs.)

60981 Effect of the group IV elements on the Π anion and cation states of thiophene and furan determined by means of ETS and UPS. A.Modelli (Istituto Chimico G. Ciamician, Univ. di Bologna, Bologna, Italy), G.Distefano, D.Jones, G.Seconi.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.1, p.63-73 (April 1983).

The electron-transmission and He(I) photoelectron spectra of $-\text{Si}(\text{CH}_3)_3$, $-\text{Sn}(\text{CH}_3)_3$ and $-\text{CH}_2\text{Si}(\text{CH}_3)_3$ derivatives of thiophene and furan have been recorded. The first two substituents perturb the energies of the outer filled π orbitals and of the empty π^* orbitals in opposite directions, causing a reduction of the HOMO/LUMO energy separation. The stabilization experienced by the π^* MO's depends on their wavefunction coefficients at the site of substitution, and is attributed to interaction with low-lying empty orbitals of the substituent groups. The relatively small size (~ 0.4 eV) of this effect on the unoccupied ring MOs suggests that it should not appreciably affect the energy of the filled MOs. The strong conjugation between the π^* unoccupied orbital of the nitro group and those of thiophene has also been investigated. (19 refs.)

34.80B Elastic scattering of electrons by atoms and molecules

60982 Monte Carlo simulation of electron-ion recombination at high pressure. W.L.Morgan (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), J.N.Bardsley.

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.93-8 (25 March 1983). The Monte Carlo method is applied to the study of electron-ion recombination in CO_2 , CH_4 and NH_3 over a wide range of pressures. Dissociative recombination is enhanced by energy transfer to the ambient gas molecules and the recombination rates peak at 11, 2 and $9 \times 10^5 \text{ cm}^3 \text{ s}^{-1}$, respectively. At very high pressures, the rate approaches the Langevin limit. (23 refs.)

60983 Positron-gas scattering measurements. W.E.Kaupilla, T.S.Stein (Dept. of Phys. & Astron., Wayne State Univ., Detroit, MI, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.30, no.2, p.1156-9 (April 1983). 1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A 4.75 MeV proton beam from a Van de Graaff accelerator is used to generate an ^{11}C positron source by making use of the $^{11}\text{B}(p,n)^{11}\text{C}$ reaction. Moderated, low energy positrons emerging from the boron target are then electrostatically focused into a beam which is used in positron-gas scattering experiments. Total scattering cross sections have been measured for 0.3 to 800 eV positrons scattering from several atoms and molecules. Comparisons of these measurements with the corresponding electron total scattering cross section measurements (made with the same apparatus and technique) reveal many interesting similarities and differences. Positronium formation has been found to play an important role in positron scattering from the gases that have been studied. (27 refs.)

60984 Coupled-channels optical theory for e-H scattering. I.E.McCarthy, A.T.Stelbovics (Inst. for Atomic Studies, Flinders Univ. of South Australia, Bedford Park, Australia).

J. Phys. B (GB), vol.16, no.7, p.1233-45 (14 April 1983). Cross sections and angular correlation parameters for scattering within the 1s, 2s, 2p channel space in the electron-hydrogen problem are calculated at 50, 54.4, 100 and 200 eV. The integral equations for the momentum-space formulation of the problem are solved with a numerical accuracy of approximately 1%. Discrete and continuum channels outside the reaction space are explicitly taken into account by computing the corresponding optical potentials and adding them to the coupling potential. Exchange terms are calculated at all stages. Relative elastic cross sections, absolute inelastic cross sections, total reaction cross sections, and angular correlation parameters up to 60° agree with experiment. (26 refs.)

60985 Resonances in the scattering of ultraslow electrons at alkali atoms.

I.I.Fabrikant. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.131-3 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.223-7 (Aug. 1982). [received: April 1983]

A theory for the effective radius for scattering at strongly polarized atoms is constructed that permits the author to extrapolate the results of calculations for the scattering phases for energies $E \geq 0.1$ eV to a region of lower energies. The proposed theory in contrast with that used earlier does not put a requirement on the smallness of αE , where α is the polarizability of the atom, and, therefore, is valid in a broader region. The theory is used for the parameterization of 3P resonances in the scattering of electrons at alkali atoms and for finding the binding energies. It is shown that extrapolation of the phases known up to the present of the scattering of electrons at Cs atoms leads to the existence of a bound 3P state of Cs instead of a 1P resonance. One possible cause of such a result involves the use of atomic wave functions, which overestimate the polarizability of the Cs atom. (22 refs.)

60986 Multichannel resonances in electron-hydrogen scattering. Y.K.Ho, J.Callaway (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.1887-92 (April 1983).

Some lower-lying doubly excited resonances in electron-hydrogen scattering converging on the $N=3, 4$, and 5 hydrogenic thresholds, as well as some lower-lying P -wave resonances associated with the $N=6$ threshold, have been calculated by a method of complex-coordinate rotation. Hylleraas-type wave functions are used for $L=0$ and $L=1$ resonances, and products of Slater orbitals for states with $L \geq 2$. Results are compared with recent calculations. Furthermore, in addition to the usual resonances of parities $(-1)^L$, resonant states with parities $(-1)^{L+1}$ are also calculated. Results are used to construct the 'super-multiplet' structures of the doubly excited resonances of two-electron atoms. (16 refs.)

60987 Nonadjustable exchange-correlation model for electron scattering from closed-shell atoms and molecules. J.K.O'Connell, N.F.Lane (Phys. Dept., Rice Univ., Houston, TX, USA).

Phys. Rev. A (USA), vol.27, no.4, p.1893-903 (April 1983).

A nonadjustable-model potential is proposed for electron scattering that includes both electron exchange and correlation effects in a hybridization of local electron-gas theory and the long-range polarization. The model potential energy function consists of the sum of the energy-dependent electron-gas exchange potential (Hara version) and the energy-independent electron-gas correlation potential smoothly joined onto the long-range polarization interaction. Illustrative calculations of elastic scattering phase shifts and cross sections are described for the rare-gas atoms, where reasonable agreement with accurate calculations suggests usefulness of the model for more complex systems. (46 refs.)

60988 Electron-atom scattering: the state of the experiments. F.H.Read (Dept. of Phys., Univ. of Manchester, Manchester, England).

Phys. Scr. (Sweden), vol.27, no.2, p.103-16 (Feb. 1983).

The state of the experiments in low-energy electron-atom scattering is reviewed as part of the proceedings of the second George J. Schulz Symposium. Particular emphasis is placed on those experimental investigations that require a high electron energy resolution, such as studies of narrow resonances and threshold excitation and ionization processes. (123 refs.)

34.80D Atomic excitation and ionization by electron impact**60989 The threshold laws for electron-atom and positron-atom impact ionization.** A.Temkin (Lab. for Astron. & Solar Phys., NASA/Goddard Space Flight Center, Greenbelt, MD, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1106-11 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Reviews only the most salient aspects of the electron-atom impact ionisation, which has recently culminated with the derivation of the correct threshold law. The author emphasises that because the problem deals with three separating charged particles at the lowest energy at which they can escape from one another, this is the most basic three-body problem in the continuum involving Coulomb forces. At the same time it also involves quantum mechanics in very fundamental way. The author discusses the Coulomb-dipole theory, the positron-atom impact ionisation and two-electron photodetachment of H^- . (18 refs.)

60990 Atomic structure contribution to high-energy electron-photon atomic scattering: results for all momentum transfers. A.Lami, N.K.Rahman (Istituto di Chimica Quantistica ed Energetica Molecolare, CNR, Pisa, Italy).

J. Phys. B (GB), vol.16, no.7, p.L207-10 (14 April 1983).

Previous results for obtaining the atomic contribution, which are valid only for low momentum transfer, are extended to all values of the momentum transfer for an electron-photon system which is scattered from a hydrogen atom, using second-order perturbation theory. The effect of the virtual transition is obtained by means of the Coulombic Green's function. At large frequencies, the atomic structure (virtual transitions) plays a predominant role. (15 refs.)

60991 The electron excitation of Si^+ . A.E.Kingston, A.Thompson, K.A.Berrington (Dept. of Appl. Maths. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland), P.L.Dufton.

J. Phys. B (GB), vol.16, no.7, p.L207-10 (14 April 1983).

The R -matrix method has been used to calculate the collision strengths for the electron excitation of the spin-forbidden transitions $3s^2 3p^2 \ ^3P^o \rightarrow 3s3p^2 \ ^4P$ and $3s3p^2 \ ^4P \rightarrow 3s3p^2 \ ^2D$ in Si^+ . Eight target states were used in the calculations. There are significant resonance series converging to the higher excitation thresholds. Effective collision strengths are given for temperatures from 1×10^3 to 1×10^5 K. (9 refs.)

60992 Autoionisation versus radiative decay of resonances in electron impact excitation cross sections. E.Treffitz (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Astrophys., Garching, München, Germany).

J. Phys. B (GB), vol.16, no.7, p.1247-51 (14 April 1983).

As shown by Pradhan (1981) the contribution of resonances to electron impact excitation cross sections may be reduced drastically by radiative decay of the resonance. It is shown here that this effect is important only in certain cases of which highly charged helium-like ions are the most prominent. In other ions, where the most important resonance series converge to target

states which do not differ from the ground state in principal quantum number, radiative decay is much less important. (5 refs.)

60993 Determination of electron-xenon total excitation cross-sections, from threshold to 100 eV, from experimental values of Townsend's α . M.Hayashi (Nagoya Inst. of Technol., Nagoya, Japan).

J. Phys. D (GB), vol.16, no.4, p.581-9 (14 April 1983).

Recommended values are presented for q_m , q_i and Q_T (momentum transfer cross-sections for elastic collisions, total cross-sections for elastic collisions and total collision cross-sections, respectively) of electrons in xenon for electron energies from 0 to 10⁵ eV. Recommended values of ionisation cross-sections q_i are also presented. Using these values of q_m together with values of q_i and Townsend ionisation coefficients α , recommended values of total excitation cross-sections q_e are determined. The values of q_m for electron energies from 5 to 20 eV are smaller than those of Frost and Phelps (1964) by a considerable amount. The values of q_e for energies from about 20 to 100 eV are much larger than those of de Heer et al. (1979). (47 refs.)

60994 Electron-impact excitation of vanadium atoms. V.V.Melnikov, Yu.M.Smirnov.

Opt. & Spectrosc. (USA), vol.53, no.1, p.15-18 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.27-32 (July 1982). [received: April 1983]

The cross sections for electron-impact excitation of the spectral lines of the vanadium atom have been measured for the first time by an intersecting-beam method. The measurements were carried out over the 300-600-nm spectral interval at incident-electron energies of 0-250 eV. The cross sections and excitation functions were measured for more than fifty spectral lines corresponding to transitions between quartet and sextet terms. The resonance transition $4^4F-x^4G^o$ has the largest excitation cross section, 1.3×10^{-15} cm² at the maximum. There are some differences between the excitation of the vanadium and that of other elements for which the d shell is being filled. (6 refs.)

60995 Effective cross sections for electron-impact excitation of barium atoms from the 5^1D_2 metastable state. I.S.Aleksakhin, S.B.Zagrebina, D.A.Ozolishin, A.V.Samson, I.I.Shafranosh, T.A.Shishova.

Opt. & Spectrosc. (USA), vol.53, no.2, p.222-4 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.375-8 (Aug. 1982). [received: April 1983]

The process of excitation of the spectral lines of barium from the 5^1D_2 singlet metastable state was investigated for the first time. An effusion beam of normal barium atoms passed through a discharge chamber, in which atoms were converted to the 5^1D_2 and $5^3D_{1,2,3}$ metastable states. At 15 mm from the discharge chamber the atomic beam was intersected by the beam of a tunable dye laser tuned to the 582.6-nm wavelength, which corresponds to the $6s5d^1D_2-5d6p^1P_1$ transition. From the upper level of this transition the atoms, as a result of spontaneous emission (the 350.1-nm line), effectively transitioned to the ground state. The laser radiation was modulated. During this the population of the 5^1D_2 level also turned out to be modulated with the same frequency. If this level is connected with other levels by any processes, the populations of the latter will also change. (4 refs.)

60996 Quantum-defect and distorted-wave theory applied to the resonance contribution of inelastic electron scattering. R.E.H.Clark, A.L.Merts, J.B.Mann, L.A.Collins (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Rev. A (USA), vol.27, no.2, p.1812-20 (April 1983).

The importance of the resonance contributions to inelastic scattering of electrons from atoms and ions has been appreciated for quite some time. The authors have used an approximate method to compute the resonance contributions to selected inelastic transitions in O VI and S IV and compare our results with other theoretical calculations. They find that their total resonance-enhanced collision strengths are in very good agreement with other calculations. They also can accurately compute the positions of individual resonances but can sometimes be in error by a factor of 2 on individual resonance widths. (20 refs.)

60997 Direct-excitation cross sections for Cd II low-lying excited states by single-electron impact on Cd atoms. T.Goto, K.Hane, M.Okuda, S.Hattori (Dept. of Electronics, Nagoya Univ., Nagoya, Japan).

Phys. Rev. A (USA), vol.27, no.4, p.1844-50 (April 1983).

Emission cross sections for ten spectral lines transiting from Cd II low-lying excited states formed by single-electron impact on Cd atoms have been measured with a photon-counting technique. Polarizations of these lines have also been examined. By the use of these results and removing the influence of cascade transitions, direct-excitation cross sections for seven low-lying states ($5^2P^o_{1/2,3/2}$, $5s^2D_{3/2,5/2}$, $6s^2S_{1/2}$, $5d^2D_{3/2,5/2}$) have been determined as a function of electron energy. They are found to be of the order of 10^{-17} cm² for the $5p$ and $5s^2$ states and of 10^{-18} cm² for the $6s$ and $5d$ states at their maxima. (12 refs.)

60998 Positronium formation in positron-hydrogen scattering. P.Khan (Muralidhar Girl's School, Calcutta, India), A.S.Ghosh.

Phys. Rev. A (USA), vol.27, no.4, p.1904-9 (April 1983).

The positronium-formation cross section in positron-hydrogen scattering has been calculated by using the distorted-wave approximation in which the total incident wave function is obtained by the method of polarized orbitals. The two variants of the polarized-orbital method, one due to Temkin and Lamkin (1961) and the other due to Callaway et al. (1968), have been employed to estimate their relative importance. The present results have been compared with those obtained by elaborate variational methods. The results obtained by using the potential of Temkin and Lamkin have been found to be encouraging. 34.80G Molecular excitation, ionization, and dissociation by electron impact

60999 Non-dipole excitation of core holes by electron impact. Multiplet splitting in CO and N₂. L.Ungier, T.D.Thomas (Dept. of Chem., Oregon State Univ., Corvallis, OR, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.247-50 (1 April 1983). Low-energy electron impact leads to non-dipole excitation of core electrons to triplet states. The multiplet splitting in CO is in agreement with theory and shows that the 2 π orbital is localized predominantly on the carbon. The splitting affects both energy-loss and Auger spectra of CO and N₂. (11 refs.)

61000 Internal energy dependence of the autodetachment and dissociation times of the SF₆⁻ ion. J.P.Astruc, R.Barbe, A.Lagrez, J.P.Schermann (Lab. de Phys. des Lasers, Univ. Paris Nord, Villetaneuse, France).

Chem. Phys. (Netherlands), vol.75, no.3, p.405-16 (15 March 1983). The dependence of the autodetachment and dissociation times of the SF₆⁻ molecular ion on the temperature of its SF₆ parent molecule has been studied in a crossed-beam experiment. The use of atoms in highly excited states (Rydberg atoms) provides a source of a well-defined nearly zero-energy electrons. By means of an inverse Laplace transform of the negative ion numbers, the authors have determined the dependence of these autodetachment and dissociation times upon the internal energy of the negative ion. The presence of a positive ionic core during the creation of the negative molecular ion is taken into account by considering a collisional stabilization process. These measurements agree with previous experiments using free electrons but cannot be reconciled with the existing statistical theory. (23 refs.)

61001 Molecular orbital electron momentum distributions and separation energies of CH₃CN. A.Minchinton, C.E.Brion, J.P.D.Cook, E.Weigold (School of Phys. Sci., Flinders Univ. of South Australia, Bedford Park, SA, Australia).

Chem. Phys. (Netherlands), vol.76, no.1, p.89-101 (1 April 1983). Acetonitrile (CH₃CN) has been studied by binary (e, 2e) spectroscopy at a total energy of 1200 eV in the symmetric non-coplanar geometry. The separation energy spectrum was determined at azimuthal angles of 0° and 8° in the energy range up to 40 eV. Above 23 eV the energy spectra show considerable intensity in addition to the two peaks expected from simple MO theory for ionization of the 5a₁ and 4a₁ orbitals. These findings are in qualitative agreement with recent theoretical predictions using the Green's function method. Electron momentum distributions have been measured for each of the valence orbitals and the results compared with two SCF wavefunction calculations using Gaussian basis sets. Position (charge) and momentum density maps were also calculated for each orbital. These maps are used to compare and contrast the electronic structure and bonding properties of CH₃CN in position and momentum space. (42 refs.)

61002 Generalised quantum defect theory for electron scattering by polar molecules. I.I.Fabrikant (Inst. of Phys., Acad. of Sci., Riga, Latvian SSR).

J. Phys. B (GB), vol.16, no.7, p.1253-67 (14 April 1983). By the use of effective-range theory electron scattering by polar molecules in the fixed-nuclei approximation is considered. The relationship between the scattering data and the electron affinity of the polar molecule is obtained. It is shown that three $2\Sigma^+$ states of the ions LiF⁺ and BeO⁺ exist. Differential and integrated cross sections for electron scattering by LiF and BeO are calculated. The relationship between the data for scattering by HCN and the electron affinity of HCN is considered. The electron affinities of HF and H₂O, calculated in the fixed-nuclei approximation, are used to obtain the scattering cross sections. (42 refs.)

61003 Frame transformation effective-range theory: application to interaction of polar molecules with electrons. I.I.Fabrikant (Inst. of Phys., Acad. of Sci., Riga, Latvian SSR).

J. Phys. B (GB), vol.16, no.7, p.1269-82 (14 April 1983). The scattering of electrons by polar molecules for energies of the order of, and less than the rotational constant B_r is considered. The formalism of the Chang and Fano (1972) frame transformation theory is used. The effective-range theory for the determination of the wavefunctions in the molecular frame is applied. The method for the calculation of the electron affinity of polar molecules is developed with rotation being taken into account. The result is applied to the calculation of eigenphases for scattering by LiF and HF molecules and to the investigation of the threshold behaviour of vibrational excitation cross sections. It is found that the ion LiF⁺ has two excited $2\Sigma^+$ states with binding energies of 0.49×10^{-2} and 0.23×10^{-2} eV. Long-range dipole forces lead to the appearance of resonances in the S, P and D waves. These resonances are too narrow (with widths of the order of 0.1 B_r) to be observed in vibrational excitation cross sections. However, they can be observed in photodetachment cross sections if the corresponding anion exists. (33 refs.)

61004 Ionisation and appearance potentials of CH₄ by electron impact. P.Plessis, P.Marmet, R.Dutil (Dept. de Phys., Univ. Laval, Laval, Quebec, Canada).

J. Phys. B (GB), vol.16, no.7, p.1283-94 (14 April 1983). The CH₄⁺ electroionisation efficiency curve and the CH₃⁺, CH₂⁺ and C⁺ appearance potential curves are presented. The data were obtained by an apparatus of very high sensitivity with an improved electron monochromator. The CH₄⁺ ionisation potential is measured to be 12.63 ± 0.02 eV. The results show that some previously reported appearance potential values should be corrected, in some cases by several electron volts. This is attributed to superior apparatus sensitivity. Ion-pair formation is clearly observed for the CH₃⁺ and CH₂⁺ fragments. The CH₃⁺ and C⁺ appearance potentials have been detected down to adiabatic threshold. The stable fragment CH₂²⁺, is also observed. (37 refs.)

61005 Ion extraction in the laser process of uranium enrichment by selective ionization of atomic vapour. C.Jacquot, J.Soubbaramayer (CENS, Gif-sur-Yvette, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.3, p.181-4 (24 Jan. 1983). In French.

A method, taking advantage of the ambipolar diffusion is developed for the extraction of ions in the laser process of isotope separation with atomic vapour. The component of extraction is a system of electrostatic lenses, located at the periphery of the plasma generated by the laser. The method has the advantage of not accelerating the electrons and transporting the product without risk of pollution. (4 refs.)

61006 Variational transition state theory and tunneling for a heavy-light-heavy reaction using an ab initio potential energy surface. ³⁵Cl+H(D)³⁵Cl-H(D)³⁵Cl+³⁵Cl. B.C.Garrett (Chem. Dynamics Corp., Columbus, OH, USA), D.G.Truhlar, A.F.Wagner, T.H.Dunning, Jr.

J. Chem. Phys. (USA), vol.78, no.7, p.4400-13 (1 April 1983). Ab initio POL-Cl calculations, augmented by a dispersion term, are used to predict the potential energy surface for the reaction Cl+HCl. The saddle point is found to be nonlinear. The surface is represented by a rotated-Morse-oscillator spline fit for collinear geometries plus an analytic bend potential. Variational transition state theory calculations, based on a linear reference path, are carried out, and they yield much smaller rate constants than conventional transition state theory, confirming that earlier similar results for this heavy-light-heavy mass combination were consequences of the small skew angle and were not artifacts of the more approximate potential energy surfaces used in those studies. Transmission coefficients are calculated using approximations valid for large-reaction-path curvature and the potential along the reference path is scaled so that the calculated rate constant agrees with experiment. The resulting surface is used to compute the H/D kinetic isotope effect which is in qualitative agreement with experiment. (51 refs.)

61007 Hydrogen isotope exchange and separation in gas-solid phase systems. G.Sicking, P.Albers, E.Magomedbekov (Univ. of Munster, Munster, Germany).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.373-91 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

Systems of two or more hydrogen-containing phases in solution equilibrium with hydrogen may not be in isotopic equilibrium. The resulting exchange of hydrogen isotopes between the phases is discussed with respect to both the kinetic behaviour and the final equilibrium state. The advantages of tracer experiments using tritium are discussed in terms of the experimental arrangement and the information attainable. It is shown that the equilibrium separation factor reflects the state of the dissolved hydrogen in different sorption states and that the exchange kinetics are affected by the state of the interphase. The effect of the total hydrogen pressure on the tracer exchange with tritium is discussed. The relationships developed are applied to the metal-hydrogen systems PdH_x and Ti_{0.6}Mn_{0.6}H_x. The results are supplemented by pressure-composition isotherms, neutron vibrational spectra, scanning electron micrographs, Auger electron spectra and Auger electron spectroscopy depth profiles obtained using argon ions. (36 refs.)

61008 Cascades for hydrogen isotope separation using metal hydrides. F.B.Hill, V.Grzetic (Brookhaven Nat. Lab., Upton, NY, USA).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.399-405 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

Designs are presented for continuous countercurrent hydrogen isotope separation cascades based on the use of metal hydrides. The cascades are made up of pressure swing adsorption (PSA) or temperature swing adsorption (TSA) stages. The designs were evolved from consideration of previously conducted studies of the separation performance of four types of PSA and TSA processes. (7 refs.)

61009 A proposed method of hydrogen isotope separation using palladium alloy membranes. J.Evans, I.R.Harris (Dept. of Metall. & Materials, Univ. of Birmingham, Birmingham, England), D.K.Ross.

J. Less-Common Met. (Switzerland), vol.89, no.2, p.407-14 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

The viability of using palladium alloy membranes in cascade to separate the hydrogen, deuterium and tritium produced in a fusion reactor is discussed. Values of the permeation separation factor are estimated for Pd-20%Ag from available data and corresponding estimates for the necessary number of stages and the total membrane area are given for the required isotopic purification. The results demonstrate the advantage of minimizing the operating temperatures and pressures and indicate that the method is perfectly feasible. The use of Pd-8%Y will probably even further improve the performance. (17 refs.)

61010 Characteristics of the permeation of hydrogen-inert gas mixtures through a palladium alloy tube wall. N.Mitsubishi, T.Yuki, I.Ichihara (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.415-22 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

A hydrogen window for the selective separation of hydrogen and deuterium in a gas stream permeating a palladium alloy tube wall was investigated. The palladium alloy used was Pd-20%Ag-5%Au and the tube was 100 mm long with an internal diameter of 1.44 mm. Permeabilities of hydrogen and deuterium were measured at 400°C and atmospheric pressure using H₂-Ar and D₂-Ar mixtures. A similar permeation experiment was performed using an H₂-D₂-Ar mixture. The permeation data for the mixture agreed with the theoretical predictions made using the permeability values obtained from the H₂-Ar and D₂-Ar experiments. Hence it was established that the permeation rates of hydrogen isotope mixtures through a hydrogen window can be estimated by the authors' equations. (9 refs.)

- 61011** Tritium isotope separation using resonance radiation. P.C.Stangeby.
Report OUEL-1429/82, Univ. Oxford, England (Aug. 1981), 41 pp.
 The isotope separation technique proposed involves exposure of a hydrogen isotopic mixture to resonance radiation from a light source (a gas discharge) containing just one isotope. Since the resonance lines are generally well separated for the hydrogen isotopes only the matching isotope in the mixture will be excited. It is envisaged that the excited atom is then ionised with the ion attracted to and trapped on an appropriate solid present within the reaction zone. (27 refs.)

35.10D Electric and magnetic moments, polarizability

- 61012** Estimation of some matrix elements of the dynamical dipolar polarizability of iodine atom from long-range dispersion energy terms for molecular iodine. J.Vigue (Lab. de Spectroscopie Hertziennne, Ecole Normale Supérieure, Paris, France), M.Saute, M.Aubert-Frecon.
J. Chem. Phys. (USA), vol.78, no.7, p.4544-6 (1 April 1983).
 The reduced matrix elements of the dynamical dipolar polarizability $\epsilon(k,k')$ of the iodine atom are derived from the dispersion energy matrix for I_2 . The preponderance of the $\epsilon(0,0)$ term, proportional to the mean value C_6 of the corresponding coefficients of all the different molecular states of I_2 , is strongly related to the quasi-isotropic feature of the C_6 coefficient. The authors' value for the static dipolar polarizability α is coherent with other determinations. (7 refs.)
61013 Use of reflection symmetry in calculating atomic polarizabilities. P.P.Vaiteckunas, A.Yu.Savukinas.
Opt. & Spectrosc. (USA), vol.53, no.2, p.120-2 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.202-5 (Aug. 1982). [received: April 1983]
 By making use of reflection symmetry in calculations of the electric polarizabilities and magnetic susceptibilities of atoms, one can derive certain expressions from the others by making the substitution $J \rightarrow -J-1$ involving the angular momentum quantum numbers. (8 refs.)

- 61014** Fine-structure parameters of the $np^2n'p$ configurations of several inert gases and alkali metal ions. G.P.Anisimova, R.I.Semenov.
Opt. & Spectrosc. (USA), vol.53, no.2, p.128-31 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.217-22 (Aug. 1982). [received: April 1983]
 A semiempirical method is used in the single-configuration approximation to calculate the fine-structure parameters, the gyromagnetic ratios, and the coupling coefficients for the $3p^25p$ and $3p^6p$ configurations of Ar I, the $4p^25p$ and $4p^6p$ configurations of Kr I, the $3p^24p$ configuration of K II, the $4p^25p$ configuration of Rb II, and the $5p^6p$ configuration of Cs II. Experimental values of the fine-structure energy intervals and the gyromagnetic ratios are used. It is shown by the examples of the $2p^33p$ and $4p$ configurations of Ne I and the $3p^6p$ configuration of Ar I that it is possible to carry out these calculations without appealing to experimental values of the gyromagnetic ratios. The results are compared with the data available in the literature. (12 refs.)

- 61015** Monte Carlo solutions of Schrodinger's equation for H_2^+ ion in strong magnetic fields. II. J.Ozaki, Y.Tomishima (Dept. of Phys., Okayama Univ., Okayama, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1142-7 (April 1983).
 For pt.1 see *ibid.*, vol.49, p.1497 (1980). Corrected results are shown for the energies and the equilibrium nuclear separations for π_g state of H_2^+ ion in magnetic field, which are reported incorrectly in the previous paper. The critical field strength for which the antibonding π_g state changes to the bonding is between 0.1 and 1.0 in units of 2.35×10^{10} G. Similar calculations are also carried out for π_u state. Numerical results obtained are in good agreement with those of others. (9 refs.)

- 61016** Influence of hydrogen bonds on electronic spectral shifts of some 9-amino acridines. A.Marty, P.Viallet (Univ. de Perpignan, Perpignan, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.5, p.343-6 (7 Feb. 1983). In French.
 The formation of hydrogen bonds which occur on amino groups and on the pyridine nitrogen atom of some 9-amino acridines is shown by the study of solvent effects on absorption and fluorescence spectra. The use of π^* , α and β parameters of Kamlet allows the relative importance of the two types of hydrogen bonds on spectral shifts to be quantified. (10 refs.)
61017 Electronic structure of molecules and infrared continua caused by intramolecular hydrogen bonds with great proton polarizability. B.Brzezinski (Inst. of Chem., A. Mickiewicz Univ., Poznan, Poland), G.Zundel.
J. Phys. Chem. (USA), vol.86, no.26, p.5133-5 (23 Dec. 1982).
 2-Quinclidene-carboxylic acid *N*-oxide (compound 1) and 3-methyl-2-pyridinecarboxylic acid *N*-oxide (compound 2) were studied by IR and NMR spectroscopy. With both compounds, strong, short intramolecular hydrogen bonds were formed. Both proton-limiting structures $OH \cdots ON \rightleftharpoons O \cdots H^+ \cdots ON$ had noticeable weight. Only with compound 1, but not with compound 2, was an intense IR continuum observed. Thus, only if the hydrogen-bond donor and acceptor groupings are not electronically conjugated do IR continua occur, since, when they are conjugated, the charge fluctuation connected with the proton fluctuation is compensated by an electron flux in the opposite direction within the molecule. (28 refs.)
61018 C-H stretching modes and the structure of *n*-alkyl chains. I. Long, disordered chains. R.G.Snyder, H.L.Strauss (Dept. of Chem., Univ. of California, Berkeley, CA, USA), C.A.Elliger.
J. Phys. Chem. (USA), vol.86, no.26, p.5145-50 (23 Dec. 1982).
 The C-H stretching modes of the conformationally disordered polymethylene chain were analyzed. Fermi resonance interaction involving HCH bending overtones was dominant in determining the shape of the Raman C-H stretching spectrum. In addition, however, it was found that the C-H stretching frequencies were significantly affected by the conformation of adjoining C-C bonds. (32 refs.)

35.20X Mass spectra

- 61019 Molecular species in the As-O system. R.D.Brittain, K.H.Lau, D.L.Hildenbrand (SRI Internat., Menlo Park, CA, USA). *J. Phys. Chem. (USA)*, vol.86, no.26, p.5072-5 (23 Dec. 1982). Mass spectrometric analyses of saturated and unsaturated vapors over arsenolite, As₂O₃(s), and over an As₂O₃-CaO mixture have identified a surprisingly large number of thermodynamically stable As-O molecular species. These species, which include As₄O₆, As₄O₅, As₄O₄, As₂O₃, As₂O₂, AsO, and perhaps As₂O₄, were identified primarily from threshold appearance potential measurements. Considerable care was required, since some ions are produced both by fragmentation and by simple ionization. There may be several fragmentation pathways yielding As₃O₄⁺, but the evidence regarding this ion is complex and a clear decision cannot yet be made. The possible effects of temperature on the mass spectra of As₄O₆ and other complex As-O species are discussed, but the evidence to date appears inconclusive. (15 refs.)

35.80 ATOMIC AND MOLECULAR MEASUREMENTS AND TECHNIQUES

- 61020 Non-equilibrium behavior on pulsed laser evaporated surfaces. L.Lynds, B.A.Woody (United Technol. Res. Center, East Hartford, CT, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.147-53 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Absorption of intense pulsed laser optical fields by metallic surfaces generates dense neutral atomic beams with high average translational energies. Mechanisms explaining this behavior are based on an equilibrium model invoking high temperatures and pressures. The authors have made experimental observations on yttrium and uranium atomic beams produced from laser evaporated targets which suggest an alternative mechanism involving a non-equilibrium process. (15 refs.)
 61021 Double infrared-third-harmonic-generation resonance as a method for investigating vibrational energy exchange. V.N.Varakin, V.M.Gordienko (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1265-6 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.1941-2 (Oct. 1982). [received: April 1983]
 A diagnostic method is proposed for the study of kinetic processes. This method is based on the relationship between the power of the third harmonic of a probe beam and the populations of resonant vibrational levels. The results are reported of experiments involving a determination of the rate of the intermolecular V-V' relaxation in CF₃I-CD₄ gas mixtures. It is reported that the rate of relaxation increases on increase in the degree of vibrational excitation of the molecules. The advances of the double infrared-third-harmonic-generation resonance method are considered. (3 refs.)
 61022 Application of the retarded potential method in mass spectrometry for the investigation of mechanisms of field ion formation. B.G.Mischanchuk, V.A.Pokrovskii, V.P.Shabel'nikov, E.N.Korol' (L.V. Pissarshevskii Inst. of Phys. Chem., Acad. of Sci., Kiev, Ukrainian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.2, p.172-7 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.2 (March-April 1982). [received: Feb. 1983]
 The authors first examine the energy balance in a very simple case, that of formation of molecular ions. They then carry out an experimental investigation of the influence of external factors on the formation energy of associative ions of water and ammonia. These results have been interpreted on the basis of the energy balance considerations. (9 refs.)

36.00 STUDIES OF SPECIAL ATOMS AND MOLECULES

36.10 EXOTIC ATOMS AND MOLECULES (CONTAINING MESONS, MUONS, AND OTHER ABNORMAL PARTICLES)

- 61023 Application to $\mu^+e^-e^+$ and $p\mu^-e^-$ of a new method for taking into account the finite nuclear mass in the determination of the absence of bound states. E.A.G.Armour (Math. Dept., Univ. of Nottingham, Nottingham, England). *J. Phys. B (GB)*, vol.16, no.7, p.1295-302 (14 April 1983).
 A recently published new method by Armour (1982) for taking into account finite nuclear mass in the determination of the absence of bound states is applied to a system made up of muonium (μ^+e^-) and a positron (e^+) and also to one made up of a mesic atom ($p\mu^-$) and a positron. It is shown that neither system has a bound state below the continuum. Some aspects of the method, which have only been briefly referred to hitherto, are discussed in detail. (14 refs.)
 61024 Resonance line at the $M=\pm 1 \rightarrow M=0$ transition in 1^3S_1 positronium. A.Z.Varisov. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.90-1 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.155-6 (July 1982). [received: April 1983]
 The measurement of the resonance variation of the coincidence counting rate of γ rays associated with 2γ annihilation caused by magnetic dipole transitions $M=\pm 1 \rightarrow M=0$ in 1^3S_1 positronium, induced by an alternating magnetic field $H_1 \cos \omega t$ perpendicular to a steady magnetic field H , detected the dependence of the size of the hyperfine splitting ΔE of the $1S$ state of positronium in gases on the gas pressure p : $\Delta E = \Delta E_0(1 + ap)$, where the constant $|a| \sim 10^{-5} - 10^{-4} \text{ atm}^{-1}$. In metal oxide powders (MgO, Al₂O₃, SiO₂) ΔE proved to be less than ΔE_0 by an amount of the order of $10^{-2} \Delta E_0$. The resonance signal was not observed in single-crystal silicon and fused quartz. An explanation is given of the foregoing facts. (9 refs.)
 61025 Hyperfine structure of positronium energy levels in a crystal field. A.Z.Varisov. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.162-5 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.278-83 (Aug. 1982). [received: April 1983]
 An analysis has been carried out of the behavior of energy levels of the hyperfine structure of the positronium atom in a crystal field in the presence of an external magnetic field. For isotropic positronium, if the effective masses of the positron and electron are not identical, along with the splitting related to the square of the magnetic field there is also a linear Zeeman effect (for the levels of orthopositronium with $m=\pm 1$). For anisotropic positronium in an axial crystal field the character of the splitting depends on the mutual orientation of the magnetic field and the axis of symmetry of the crystal field. The special features of the hyperfine structure of the positronium atom in a crystal field can manifest themselves in experiments that observe the precession of the polarization vector of the positronium in the magnetic field and should lead to an anisotropy in the magnetic quenching of positronium in oriented crystals. (14 refs.)
 61026 Application of modified adiabatic approximation to $pp\mu$, $dd\mu$, and $tt\mu$ mesomolecules. M.N.Adamov, A.V.Filinskii. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.206-7 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.351-4 (Aug. 1982). [received: April 1983]
 It is shown that the application to homonuclear mesomolecules of the modified adiabatic approximation (MAA) with the coefficient of adiabaticity independent of the slow subsystem coordinates yields results that are considerably more accurate than those obtained when the ordinary adiabatic approximation (OAA) is used. One can, therefore, attempt to use the MAA for calculation by expanding the desired wave function on the basis of modified two-center functions. (11 refs.)
 61027 Limit on exotic two-body decays of orthopositronium. G.Carboni (CERN, Geneva, Switzerland), W.Dahme. *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.349-52 (7 April 1983).
 The authors have searched for the exotic annihilation of orthopositronium, $e^+e^-(^3S_1) \rightarrow a^0\gamma$, where a^0 denotes a neutral particle of mass $m_a < 2m_e$. The negative results of this search allow them to derive an upper limit on the coupling constant $\tilde{\alpha}$ of the hypothetical a^0 in the mass range $150 < m_a < 900 \text{ keV}$. The bound is about 10 times lower than the one derived from the $(g-2)$ measurements. (7 refs.)
 61028 Diabatic-state treatment of negative-meson moderation and capture. II. Mixtures of hydrogen and helium. J.S.Cohen, R.L.Martin, W.R.Wadt (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.1821-30 (April 1983).
 For p see *ibid.*, vol.24, no.1, p.33, 1981. Slowing-down and capture cross sections have been consistently calculated for μ^- , π^- , K^- , and p in collisions with hydrogen and helium atoms and isotopic variants. Capture-energy distributions are determined using the differential-energy-loss cross sections in the laboratory frame. Capture is found to occur predominantly at energies near or below the ionization potential of the target. Ratios of capture on different species are given as a function of the mole fraction of each species present in mixtures. For π^- in a He-H mixture the reduced capture ratio obtained is ~ 0.73 , slightly less than the experimental value of 0.92 for the He-H₂ mixture. In contrast with another recent theoretical calculation and in agreement with experimental analysis, it is found that atomic capture of pions in the helium-hydrogen mixture is only slightly nonlinear. It is pointed out that some prior theoretical treatments are in error because of inconsistent calculation of the slowing-down and capture processes and/or subsequent approximate treatment of the energy transport. Use of capture and transfer rates in muon kinetics, e.g. muon-catalyzed fusion, is discussed. (29 refs.)

36.20 MACROMOLECULES AND POLYMER MOLECULES

[for biological macromolecules, see also 87.15; for polymer reactions and polymerization, see 82.35]

61029 Systematic blobbing procedure for the calculation of universal polymer properties. G.F.AI-Noaimi (Dept. of Phys., Univ. of Qatar, Doha, Qatar), G.C.Martinez-Mekler, R.M.Velasco B. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.3316-24 (15 March 1983).

A systematic renormalization group transformation along the chemical sequence of a polymer chain, systematic blobbing procedure (SBP), is introduced for the calculation of universal configurational properties. The method, which does not rely on the field theoretic analogy, gives to first order in ϵ ($\epsilon=4-d$, d =space dimension) a firm basis to the decimation procedure suggested by de Gennes (1977) and put into practice by Gabay and Garel (GG (1979)). The renormalization transformation acts on a 'Hamiltonian' of the system and produces Wilson-type approximate recursion relations for the coupling parameters. The SBP is used to calculate the exponent ν for a polymer chain in the good solvent region to first order in ϵ . The method can in principle be extended to higher orders in ϵ . By means of the SBP it is shown that the static universal properties of a polymer chain are not modified by the presence of a Gaussian random potential. The validity of the GG method is further strengthened by showing the equivalence, in the determination of ν , of their method and a Fixman perturbation matching procedure. The exponent ν is subsequently obtained to second order in ϵ . All the results agree with the 'corresponding' field theoretic calculations. (25 refs.)

61030 Dipolar rotational spin-echo ^{13}C NMR of polymers. J.Schaefer, R.A.McKay, E.O.Stejskal (Phys. Sci. Center, Monsanto, St. Louis, MO, USA), W.T.Dixon. *J. Magn. Resonance (USA)*, vol.52, no.1, p.123-9 (March 1983).

The strength of a static dipolar interaction between an isolated ^{13}C and ^1H spin pair is known if the internuclear distance is known. This is the usual situation for a directly bonded CH fragment in a solid polymer. The reduction in the strength of the CH dipolar interaction by molecular motion (of frequency comparable to or greater than the dipolar interaction itself) thus becomes a measure of the amplitude of the motion. In performing such a measurement on a real system, the condition that the ^{13}C - ^1H spin pair be isolated from many-body proton dipolar coupling is achieved by phase-shifted multiple-pulse (WAHUHA) ^1H - ^1H decoupling. The time evolution of the cross-polarization carbon magnetization is then detected under the influence of ^1H - ^{13}C coupling along. The resulting carbon signal can be observed with magic-angle spinning for high resolution. The pulse sequence for this experiment is shown. The evolution of the carbon magnetization due to chemical shift effects is refocused after two rotor periods by a carbon 180° pulse applied after the first rotor period. The ^1H - ^{13}C dipolar modulation is followed by varying the number of WAHUHA pulse sequences during a time t_1 . The spinning speed is chosen so that an integral number of WAHUHA cycles exactly fits into one rotor period. (24 refs.)

61031 Suppression of the solvent resonance in 2D NMR spectra of proteins in H_2O solution. G.Wider, R.V.Hosur, K.Wuthrich (Inst. für Molekularbiologie und Biophys., Eidgenössische Tech. Hochschule, Zurich, Switzerland).

J. Magn. Resonance (USA), vol.52, no.1, p.130-5 (March 1983). The abundance of publications on techniques for recording one-dimensional high-resolution ^1H NMR spectra of biological macromolecules in aqueous solution clearly indicates that the importance of such experiments for biological applications of ^1H NMR has long been recognized. Specifically for ^1H NMR studies of peptides and proteins, fundamental considerations show that the amide protons play a pivotal role for both the resonance assignments and the determination of the spatial structure. While in favorable cases certain amide protons in proteins exchange sufficiently slowly with the solvent to be studied in D_2O solution, investigations extending over the entire polypeptide chain will in all cases have to depend on data recorded in H_2O . Therefore, once the important advantages of two-dimensional (2D) NMR over conventional NMR experiments for studies of proteins were demonstrated with experiments in D_2O , it was of utmost importance to devise experimental schemes by which 2D NMR data sets could be recorded for proteins were demonstrated with experiments in D_2O , it was of utmost importance to devise experimental schemes by which 2D NMR data sets could be recorded for protein solutions in H_2O . The note reports on the authors' experience with the use of different solvent suppression schemes for such experiments. (21 refs.)

61032 Studies of cyclic and linear poly(dimethyl siloxanes). X. Calculations of radii of gyration. C.J.C.Edwards, D.Rigby, R.F.T.Stepto (Dept. of Polymer Sci. & Technol., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), K.Dodgson, J.A.Semlyen. *Polymer (GB)*, vol.24, no.4, p.391-4 (April 1983).

For pt.IX see *ibid.*, vol.23, p.873 (1982). A Monte Carlo method has been devised for calculating the conformation-dependent properties of cyclic poly(dimethyl siloxanes), using P.J. Flory, V. Crescenzi and J. Mark's rotational isomeric state model (1964). Calculated values of the mean-square radii of gyration ($\langle s^2 \rangle$) of ring molecules unperturbed by excluded volume effects and containing 8-100 skeletal atoms are compared with the (s^2) values for the corresponding unperturbed chain molecules. Exact enumeration methods were also employed for rings $[(\text{CH}_3)_2\text{SiO}]_{w/2}$ with $w \leq 24$ and the results found to be in close agreement with those obtained by the Monte Carlo method. The ratio $\langle s^2 \rangle / \langle s^2 \rangle_0$ was found to attain limiting values close to 2.0 for $w > 30$, in agreement with theoretical predictions. (53 refs.)

61033 Studies of cyclic and linear poly(dimethyl siloxanes). XI. Shapes of ring and chain molecules. C.J.C.Edwards, D.Rigby, R.F.T.Stepto (Dept. of Polymer Sci. & Technol., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), J.A.Semlyen. *Polymer (GB)*, vol.24, no.4, p.395-9 (April 1983).

For pt.X see *ibid.*, vol.24, p.391-4 (1983). The equilibrium shapes of cyclic and linear poly(dimethyl siloxane) (PDMS) molecules have been investigated using P.T. Flory, V. Crescenzi and J. Mark's rotational isomeric state model (1964), together with a Monte Carlo method. The principal axes of the equivalent ellipsoids have been computed and the major change on ring formation was found to be a reduction in the longest axis of the ellipsoid. The shapes of the cyclics $[(\text{CH}_3)_2\text{SiO}]_{w/2}$ in the region $w=20$ are disc-like and this observation is related to the different bond angles at silicon and oxygen atoms. Bulk densities and refractive indices of PDMS rings are discussed in relation to the calculated molecular shapes. (14 refs.)

61034 The effect of disorder in stereo-irregular polymer chains. R.Riklund, S.Stafstrom (Dept. of Phys. & Measurement Technol., Univ. of Linköping, Linköping, Sweden). *Philos. Mag. B (GB)*, vol.47, no.3, p.247-57 (March 1983).

The intricate interplay between electron-electron interactions and structural disorder is studied for a model polymeric stereo irregular chain of hydrogen

atoms, treating the constant bond length as a varying parameter. Eigenstates and densities of states are calculated using a modified spin-polarized Hartree-Fock scheme. The electronic structure is also compared with that of a regular chain. Based on the result from the numerical solution, a model Hamiltonian suitable for analytical treatment of this system is also proposed. (15 refs.)

61035 Calculation of the characteristics of the conduction band for excess electrons in proteins. S.L.Mironov (A.A. Bogomolet Inst. of Physiology, Acad. of Sci., Kiev, Ukrainian SSR).

Theor. & Exp. Chem. (USA), vol.18, no.2, p.132-6 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.2, p.155-61 (March-April 1982). [received: Feb. 1983]

The author has calculated the electron affinity of a peptide group and determined the characteristics of the conduction band for excess electrons in the energy spectrum of proteins for their α -helical and β -forms. (16 refs.)

61036 On diffusional mobility of chain molecules. V.P.Budtov.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.477-85 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The various molecular models of diffusional motion of macromolecules in viscous and viscoelastic media are described. The main type of motion in a viscoelastic medium is the one-dimensional motion of short fragments of the chain: 'slip' and cooperative motion models. The concept of the diffusional segment of the chain b is introduced characterizing the distance between disturbance of the structure moving along the chain. For $L < b$ (L is the length of the chain) $D \sim M^{-1}$, while for $L > b$ $D \sim M^{-2}$. The contribution of end fragments of macromolecules into diffusional mobility is discussed. The results are compared with the data of computer simulation and NMR and 'labeled' atoms methods. The good coincidence of theoretical and experimental results is shown for polydimethylsiloxane permitting one to determine the main molecular parameters. The effect of MM of the matrix is also shown. For PE, PEO, polypropylene and butyl-styrene rubber the main parameters of diffusion of macromolecules in the melt are found. (17 refs.)

61037 Simulation of the structure of polyunsaturated macromolecules.

A.L.Rabinovich, V.G.Dashevskii.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.537-43 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

To study properties of nonbranched molecules of polyunsaturated hydrocarbons and methyl esters of fatty acids with methylene-discontinuous double bonds 20 fragments containing five-seven atoms in the main chain are chosen, and the maps of their conformational energy are drawn. The calculations are performed for the model of atom-atom potential functions (taking into account the nonvalent interactions, torsion and electrostatic terms). The analysis of conformational maps and experimental data permits one to conclude the expediency of the account of the continuous spectrum of conformations during the simulation of conformational properties of molecules of given class. (33 refs.)

61038 Conformational analysis of polyunsaturated macromolecules in solution continuum model. V.G.Dashevskii, A.L.Rabinovich.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.544-50 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The method of the study of conformational properties of polyunsaturated molecules of hydrocarbons and methyl esters of fatty acids is proposed basing on the model of atom-atom potential functions. The algorithm of the generation of chains by the Monte Carlo method for the model with the continuous spectrum of conformations is derived taking into account the details of the stereochemical structure, correlation and retardation of internal rotations and excluded volume. 36.40 ATOMIC AND MOLECULAR CLUSTERS

61039 A CNDO/2 study of the growth of model lithium clusters. S.P.Delneshev (Inst. of Generale Inorganic Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria).

C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.11, p.1511-13 (1982). The energetically most favourable growth of a model lithium cluster is studied. The binding energy (BE) of the cluster is calculated by the Complete Neglect of Differential Overlap (CNDO/2) method. The geometry of the most stable cluster for each number of atoms is expected to be closer to the real geometry than that found by the HMO method. The expectations were based on the literature reporting satisfactory results obtained by the CNDO/2 method on stereochemical constants in certain molecules. The BE values for each cluster were used only as a measure in arranging, according to their stability, clusters having the same number of atoms in different positions. In

addition it is supposed that the CNDO/2 approximation leads to no qualitative changes in the clusters arrangement according to their stability. (11 refs.)

61040 A correlation between structure and reactivity in ion clusters. A.J.Stace, C.Moore (Dept. of Chem., Univ. of Southampton, Southampton, England). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.80-4 (25 March 1983). Observations on metastable peaks resulting from the unimolecular decomposition of clusters show that intensity variations as a function of cluster size can reveal the presence of stable cluster configurations. This technique has been used to conform that $(\text{H}_2\text{O})_{21}\text{H}^+$ and $(\text{D}_2\text{O})_{21}\text{D}^+$ are stable ion clusters, and the method also provides evidence to suggest that Ar_{19}^+ is a particularly stable species. (23 refs.)

61041 On the origin of the occurrence of 'magic numbers' in cluster size distributions of xenon in the compressed gas phase. E.E.Polymeropoulos, J.Brickmann (Inst. für Phys. Chem., Tech. Hochschule Darmstadt, Darmstadt, Germany). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.273-5 (8 April 1983). The formation of clusters in compressed argon and xenon gases is studied with the molecular dynamics simulation technique using two-body Lennard-Jones and three-body Axilrod-Teller potentials. It is suggested that the occurrence of clusters corresponding to the 'magic number' $n=13$ for xenon and the absence of such stable clusters for argons is due to the dispersion forces that result from triple-dipole interactions. (17 refs.)

61042 Binary compound clusters formed by free jet expansion. Y.Saito (Technol. Dev. Centre, Toyohashi Univ. of Technol., Toyohashi, Japan), K.Mihama, T.Noda. *Jpn. J. Appl. Phys. Part 2 (Japan)*, vol.22, no.3, p.179-81 (March 1983). Atom-clusters of NaCl, KCl, PbS and PbSe have been produced by adiabatic expansion of the vapour through a small nozzle. These clusters have been ionised by electron bombardment and analysed by time-of-flight mass spectrometry. Formation of compound clusters from MX to $(\text{MX})_n$ has been observed for all the samples, where M represents a cation and X an anion. Alkali halide clusters are considered to keep their stoichiometry. On the other hand, for lead chalcogenides, clusters having non-stoichiometric compositions as well as those having stoichiometric compositions are formed, though the former clusters are less abundant than the latter. (8 refs.)

61043 Supersonic copper clusters. D.E.Powers, S.G.Hansen, M.E.Geusic, D.L.Michalopoulos, R.E.Smalley (Dept. of Chem., Rice Univ., Houston, TX, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.2866-81 (15 March 1983). Copper clusters ranging in size from 1 to 29 atoms have been prepared in a supersonic beam by laser vaporization of a rotating copper target rod within the throat of a pulsed supersonic nozzle using helium for the carrier gas. The clusters were cooled extensively in the supersonic expansion [$T(\text{translational})$ 1 to 4 K, $T(\text{rotational})=4\text{K}$, $T(\text{vibrational})=20$ to 70K]. These clusters were detected in the supersonic beam by laser photoionization with time-of-flight mass analysis. Using a number of fixed frequency outputs of an exciplex laser, the threshold behavior of the photoionization cross section was monitored as a function of cluster size. The 7.9 eV photon energy of the F_2 excimer laser was found to be above the ionization potential of all clusters, and the photon mass spectrum thus produced showed the copper cluster concentration in the beam to follow a monotonically decreasing function of cluster size. The 6.4 eV ArF exciplex laser photon energy was found to be above the photoionization threshold of clusters with three or more atoms in the case of odd-numbered clusters, but only for clusters with eight or more atoms for even-numbered clusters. Extending out to clusters as large as 29 atoms, laser photoionization at 6.4 eV produced a time-of-flight mass distribution with a pronounced even/odd alternation in cluster photoion intensity. This alternation in ionization threshold behaviour was attributed to an even/odd alternation in the electronic structure of the copper clusters with the highest occupied molecular orbital (HOMO) of the even clusters being considerably more strongly bonding than it is in the clusters with an odd number of copper atoms. The 4.98 eV photon energy of the KrF exciplex laser was found to lie below the ionization threshold of all clusters in the 1 to 29 atom range. An extensive survey of the ultraviolet absorption spectrum of the copper dimer was also performed with this supersonic beam source. Resonance two-photon ionization (R2PI) with mass selective detection allowed the detection of five new electronic band systems in the region between 2690 and 3200 Å, for each of the three naturally occurring isotopic forms of Cu_2 . In the process of scanning the R2PI spectrum of these new electronic states, the ionization potential of the copper dimer was determined to be 7.894 ± 0.015 eV. (32 refs.)

61044 Molecular clustering about a positive ion. Structures, energetics, and vibrational frequencies of the protonated hydrogen clusters H_3^+ , H_5^+ , H_7^+ , and H_9^+ . Y.Yamaguchi, J.F.Gaw, H.F.Schaefer,III (Dept. of Chem., Univ. of California, Berkeley, CA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4074-85 (15 March 1983). The positive hydrogen clusters $\text{H}^+(\text{H}_2)_n$, for $n=1,2,3,4$ have been studied via nonempirical molecular electronic structure theory. Using double zeta (DZ) and double zeta plus polarization (DZ+P) basis sets, wave functions are reported at both the self-consistent field (SCF) and configuration interaction including all single and double excitations (CISD) levels of theory. In each case analytic gradient techniques have been used to locate stationary point geometries and to predict harmonic vibrational frequencies. The effects of electron correlation are shown to be greater for these loose molecular complexes than for ordinary molecules. Although H_3^+ in its lowest energy conformation is not qualitatively described as H_3^+ , H_5^+ , the larger molecular ions do fit the qualitative picture $\text{H}_3^+(\text{H}_2)_n$ with H_3^+ as a nucleating center. Of special interest here are the 'new' normal modes of these clusters, i.e., those modes having no counterpart in the isolated H_3^+ or H_2 species. There are 15 such vibrational degrees of freedom for H_9^+ , and the resulting harmonic vibrational frequencies range from 775 cm^{-1} all the way down to 63 cm^{-1} . Dissociation energies as a function of cluster size follow the pattern established experimentally by Hiraoka and Kebalre (1975). (47 refs.)

61045 Dual finite-element calculations for static electric and magnetic fields. P.Hammond (Dept. of Electrical Engng., Univ. of Southampton, Southampton, England), T.D.Tsiboukis. *IEE Proc. A (GB)*, vol.130, no.3, p.105-11 (May 1983).

The finite-element method is widely used for the solution of field problems but the method, as generally applied, suffers from the fact that it is not known how close the solution is to the actual value. This uncertainty can be reduced by providing a dual finite-element method which is so arranged that both methods together provide upper and lower bounds to the correct solution. It is found that the double approach also promises economies in the computation. The authors examine the physical basis of the dual method and apply it to Laplacian and Poissonian problems. (7 refs.)

61046 Creation and measurement of magnetic fields nearly dipolar. M.Bernheim (ENSIMAG, Grenoble, France). *Onde Electr. (France)*, vol.63, no.3, p.47-50 (March 1983). In French. An expression of a limited expansion in Cartesian coordinates of the static magnetic field produced by a cylindrical coil, is given. One of the first uses of the formula is to demonstrate how magnetic fields approaching complete dipolarity can be obtained. (2 refs.)

61047 An admittance solution for electromagnetic coupling through a small aperture. J.R.Mautz, R.F.Harrington (Dept. of Electrical & Computer Engng., Syracuse Univ., Syracuse, NY, USA). *Appl. Sci. Res. (Netherlands)*, vol.40, no.1, p.39-69 (1983).

An admittance solution for electromagnetic coupling through a small aperture in a conducting screen is obtained by the method of moments. This solution gives the equivalent magnetic current in the aperture as a linear combination of the three quasi-static magnetic currents responsible for the three dipole fields seen in the far zone. Because only the dipole effects of the quasi-static currents are known, the elements of the excitation vector and the admittance matrix cannot be evaluated directly. Reciprocity is used to express the elements of the excitation vector in terms of the short-circuit incident fields. The imaginary parts of the elements of the admittance matrix are evaluated by forcing the moment solution to be equal to the solution predicted by conventional small aperture theory. The real parts of the elements of the admittance matrix are extracted from the quadratic expression for the power radiated by the magnetic current. The solution is applied to three examples—an aperture in a conducting plane, an aperture in a transverse wall between two rectangular waveguides, and an aperture in a lateral wall of a rectangular waveguide coupling to a half-space. (8 refs.)

61048 Induced eddy current calculation in high permeability bodies using method of differences. M.Albach, L.Hannakam (Tech. Univ. Berlin, Berlin, Germany).

Arch. Elektrotech. (Germany), vol.66, no.2, p.67-74 (1983). In German. Shows that a conducting high permeability body brought into a magnetic field could be, in effect, studied through the introduction of a new boundary condition of the third kind, that stipulates the proportionality of the resultant vector-potential in air, defined on the surface of the body, to the normal differential of the same. As a result, the method of differences requires only this new boundary condition and the Laplace-equation for the surrounding medium. This procedure is applied to a rectangular body with special emphasis on the edges of the body. The induced surface eddy-current proportional to the vector-potential in the surrounding medium is calculated and compared with analytical solutions of the boundary value problem in the case of stationary skin-effect. (2 refs.)

61049 Skin effect and eddy currents in a thin tape. M.Krakowski, H.Morawski (Tech. Univ. of Lodz, Lodz, Poland). *Arch. Elektrotech. (Germany)*, vol.66, no.2, p.95-8 (1983).

The skin effect due to the a.c. flowing through a thin metallic tape is examined. The formulae for the resistance and internal inductance of the tape are derived. The eddy-current distribution and the eddy-current losses in the tape situated in a homogeneous TM field are analysed. (8 refs.)

61050 Eddy currents in circular, square and rectangular rods. B.Beland (Dept. of Electrical Engng., Univ. of Sherbrooke, Sherbrooke, Quebec, Canada). *IEE Proc. A (GB)*, vol.130, no.3, p.112-21 (May 1983).

Eddy-current losses due to sinusoidal magnetomotive force are computed for square, circular, and rectangular rods using a rectangular B/H curve. For all sections, it is assumed that the induced currents flow on a path parallel to the sides. The results are normalised and given in a table from which many computation steps can be saved. The saturating induction is chosen as the value of B which corresponds to a quarter of the applied magnetic field on the magnetisation curve. The validity of the hypothesis is confirmed by measurements made on 15 rings, constructed from mild steel, cast iron and special magnetic alloys. The power factor and losses are usually predicted within 10% for a field ranging from 200 to 70000 A/m. (6 refs.)

61051 Proximity effect between a wire carrying current and a rotating cylindrical conductor. I.R.Ciric (Dept. of Electrical Engng., Univ. of Manitoba, Winnipeg, Manitoba, Canada). *IEEE Proc. A (GB)*, vol.130, no.3, p.122-8 (May 1983).

The general expressions of the quasistationary electromagnetic field quantities, as well as the power loss, forces and torque, for a rotating cylindrical conductor in the proximity of a parallel straight wire carrying AC or DC, have been obtained by means of the magnetic vector potential, assuming a two-dimensional field. Specific motional field effects are shown explicitly in the DC case, when proximity factors and practical formulas of the losses, forces and torque are derived for values of motional depth of penetration large or small compared with the cylinder radius. (9 refs.)

61052 Symmetries in coherent and partially coherent fields. A.W.Lohmann, J.Ojeda-Castaneda, N.Streibl (Phys. Inst. Univ. Erlangen, Erlangen, Germany).

Opt. Acta (GB), vol.30, no.4, p.399-402 (April 1983).

The operator form of the solution for the wave equation is employed to indicate the symmetry properties of the diffracted field under coherent and partially coherent illumination. Such symmetries are of interest in holography, phase conjugation, and for automatic focusing. (9 refs.)

61053 Diffraction by a perfectly conducting elliptic cone. E.Vafiadis, J.N.Sahalos (Univ. of Thrace, Xanthi, Greece).

Arch. Elektrotech. (Germany), vol.66, no.2, p.117-24 (1983).

The exact solution for the electromagnetic field diffracted by a perfectly conducting elliptic cone is determined. The solution is presented in the form of a dyadic Green's function which is the most general form of solution. It uses the spheroidal coordinate system where the elliptic cone is one of the coordinate surfaces. Results are shown for the first main contributed eigenvalues and eigenfunctions and for the far zone field in some special cases. (7 refs.)

61054 Boundary diffraction of an inhomogeneous wave. P.-A.Belanger (Dept. de Phys., Univ. Laval, Quebec, Canada), M.Couture. *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.446-50 (April 1983).

An exact decomposition of the diffracted field into a direct wave and a boundary diffraction wave is obtained for an incident inhomogeneous wave, namely, the complex-source-point spherical wave. The authors' result, in the paraxial approximation, is consistent with already published results on the diffraction of a Gaussian beam. (15 refs.)

61055 Directional diagrams of coherent volume radiators and diffraction by 3-D periodic structures. Yu.V.Aristov, V.M.Rysakov.

Opt. & Spectrosc. (USA), vol.53, no.2, p.182-5 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.313-19 (Aug. 1982). [received: April 1983]

It is shown that an expansion in a 3-D spatial spectrum of the envelope of an amplitude distribution of sources that varies slowly in space is an effective method of analyzing directional diagrams. With its help some general properties of the radiators are established. The treatment is illustrated with the example of a radiator in the form of a Gaussian ellipsoid of revolution. (8 refs.)

61056 Surface electromagnetic fields. P.J.Feibelman (Sandia Nat. Labs., Albuquerque, NM, USA).

Prog. Surf. Sci. (GB), vol.12, no.4, p.287-407 (1982).

Recent progress in the theory of surface electromagnetic fields is reviewed. Difficulties are noted in applying the textbook theory of refraction to fields within Å of a surface. These difficulties have been overcome with the development of a nonlocal description of surface optics, that has largely been applied to free-electron metal surfaces. Various model versions of non-local surface optics are described and quantitatively compared. Opportunities for, and actual contact between the theory of surface electromagnetic fields and experiments are described. Directions for future research in the area are discussed. (125 refs.)

61057 The wave vector component parallel to the magnetic field of the reflected cyclotron harmonic wave. T.Utsunomiya (Dept. of Electrical Engng., Nat. Defense Acad., Yokosuka, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.1, p.153-4 (Jan. 1983). In Japanese.

Shows that the magnitude of wave vector component parallel to the magnetic field of the reflected cyclotron harmonic wave is more limited by a frequency condition for propagation than the Landau damping condition alone. The condition is revealed with a numerical example for the permitted parallel component. (3 refs.)

61058 Diffraction of cylindrical wave by smooth and polygonal cylinders. H.Shirai, K.Hongo (Faculty of Engng., Shizuoka Univ., Hamamatsu, Japan), H.Kobayashi.

Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan), vol.E66, no.2, p.116-23 (Feb. 1983).

Expressions are derived for estimating the scattered and diffracted field in the presence of the polygonal cylinder using high frequency technique which is closely related with equivalent current or equivalent moment method. As a first step, the authors verify the method by applying it to various kinds of polygonal cylinders. The numerical results for radiation patterns are compared with those obtained by other methods. The agreement between them is fairly good and difference between them is not recognised except in a small region near a shadow boundary of the polygonal cylinder. Next, the authors study the estimation of the diffracted field of smooth convex cylinder by approximating it with corresponding polygonal cylinder. As an illustration they consider radiation of electric and magnetic line source in the presence of conducting circular cylinder since the exact solution of the problem is readily obtained. (9 refs.)

61059 On the motion of an ion near a conducting wall: correlation effects. R.M.Mazo.

J. Chem. Phys. (USA), vol.78, no.5, p.2635-41 (1 March 1983).

When a charged particle moves near a conducting wall, the induced current exerts a retarding force on the particle. The magnitude of this retarding force for a single ion has previously been computed. Here, the effects of ionic spatial correlations in an electrolyte solution are examined. The author finds that, at large distances from the wall, there is partial screening of the retarding force. At small distances, where the entire effect is largest, the previously considered single ion contribution is dominant. (8 refs.)

61060 Motion and emission of a classical relativistic particle in a nonuniform laser wave. O.N.Metelitsa, A.A.Sokol'ski (State Univ., Minsk, Belorussian SSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1062-4 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1731-3 (Sept. 1982).

[received: April 1983]

In connection with an idea advanced by Baryshevskii (see Dokl. Akad. Nauk BSSR, vol.5, p.232, 1979) that high energy particles can channel through a nonuniform laser wave, a theoretical analysis of their motion and emission is carried out within the framework of classical theory. The effective potential, the Lindhard angle, and the minimum turning radius are obtained for a relativistic particle in an 'optical channel'. It is shown that the particle radiation is concentrated in two frequency regions. The higher-frequency component can exceed the frequency of the laser wave by a factor of $(E/mc^2)^2$. It is also shown that for a particle moving in a field produced by superposition of a circularly polarized laser wave and a time-independent nonuniform magnetic field it is possible to achieve a growth of the depth of the potential well with increasing particle energy. (3 refs.)

61061 Parametric conversion of electromagnetic waves in a relativistic electron beam moving in a cylindrical waveguide. N.Ya.Kotsarenko, A.A.Silivra.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1178-81 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1915-21 (Oct. 1982).

[received: April 1983]

Parametric interaction of two electromagnetic waves with a space charge wave in an electron beam is considered. The space charge wave frequency is equal to the difference in the frequencies of the two electromagnetic waves, and the electron beam travels in a round cylindrical waveguide. The relativistic electron beam is assumed to be monoenergetic and charge- and current-neutralized, and to uniformly fill the interior of the waveguide. It is shown that the finiteness of the beam and interaction region transverse to the beam results in generation of a whole spectrum of waves excited by the initial pumping wave. The nature of the resulting instability and the spectral distribution of the gain are determined. Numerical estimates are given for specific examples. (8 refs.)

61062 Undulator radiation of charged particles moving above a domain structure. V.L.Bratan, G.M.Genkin, V.V.Zil'berberg (Inst. of Appl. Phys., Acad. of Sci., Gorki, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.419-20 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.970-3 (Aug. 1982).

[received: April 1983]

The undulator radiation of high-energy particles in spatially periodic fields is a universal source of electromagnetic waves from the microwave range to the X-ray range. The undulators which are ordinarily used are macroscopic magnet systems with periods ranging from tens of centimeters to a few millimeters or the internal atomic fields of crystals. Periodic domain structures which occupy an intermediate position between these two types of undulators may also be of definite interest. The periods of these structures are several orders of magnitude smaller than those of macroscopic systems, and the fields are so strong that they can impart oscillatory velocities to the particles which are much higher than those in atomic undulators. Furthermore, in contrast with atomic undulators, short-wavelength radiation can be excited as the particles move in the fringing fields near the surface of a ferromagnet with an unclosed magnetic flux. This makes it possible in principle to use arbitrarily dense particle beams. (7 refs.)

61063 Enhanced stopping of relativistic electron beams using applied magnetic fields. Y.Marou, A.E.Blaugrund (Weizmann Inst. of Sci., Rehovot, Israel).

J. Appl. Phys. (USA), vol.54, no.4, p.1666-9 (April 1983).

A high-current-density relativistic electron beam is extracted through a thin anode window from the pinch region of a diode. An externally applied azimuthal magnetic field forces the electrons to make multiple passes through the

anode window or through adjacent metal or insulator foils, thus causing enhanced energy deposition and X-ray emission. Enhancement factors of 2 to 4 have been observed. (13 refs.)

61064 Space-charge conditions in an intense relativistic particle beam. V.L.Aleynikov, Yu.A.Pirogov (Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1123-6 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1832-7 (Sept. 1982). [received: April 1983]

A study is made of the passage of a unipolar flow through a diode gap with arbitrary potentials, including relativistic ones (generalized diode). Conditions are defined for space-charge limitation for relativistic fluxes, and deviations are demonstrated from the Child-Langmuir nonrelativistic relations from the exact relativistic formulas in the one-dimensional approximation. (11 refs.)

61065 Electrostatic single astigmatic cylindrical lenses. L.G.Glikman, Z.D.Iskakova (Inst. of Nuclear Phys., Acad. of Sci., Alma-Ata, Kazakh SSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1150-2 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1874-7 (Sept. 1982). [received: April 1983]

The authors have studied the electron-optical properties of three-electrode single astigmatic cylindrical lenses with identical electrode diameters. In the calculations it is assumed that the gaps between the electrodes are infinitesimal and the lines separating them form part of the line of intersection of two cylinders of identical radius. The authors have found the parameters characterizing the paraxial properties of the lenses and their coefficients of spherical aberration with the object at infinity for various values of the ratios of electrode potentials and the distances between slits. The three-electrode single lens collects beams of charged particles in one plane and scatters in another plane over an entire selected range of values of potential ratios. It is shown that in single lenses the coefficients of spherical aberration are of different signs and one of the coefficients passes through zero. (7 refs.)

61066 Design of electrostatic lenses with a concave cathode. N.K.Zolina, Yu.A.Flegontov.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1190-5 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1938-45 (Oct. 1982). [received: April 1983]

Analytic expressions are derived which describe quite accurately the imaging characteristics of a cathode lens with a concave cathode in terms of the field parameters (more precisely, in terms of the derivatives of the field at the cathode). These equations generalize those previously published for lenses with a flat cathode. The accuracy of the equations is illustrated by numerical examples in which the results are compared with other methods of calculation. Recommendations are given for approximating the field so as to maximize the accuracy of the derived equations. As an example, the field and electrode dimensions are calculated for a lens producing images with small distortion and meridional curvature error. (7 refs.)

61067 Steady states of thin high-current relativistic electron beams in magnetic fields. N.F.Kovalev, M.I.Fuks (Inst. of Appl. Phys., Acad. of Sci., Gorkii, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1230-4 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2002-8 (Oct. 1982). [received: April 1983]

A method is proposed for calculating the parameters of an electron beam from the injection plane to the collector in an irregular vacuum channel with an arbitrarily changing cross section. Beam formation and transport are considered by reducing the problem to a study of the solutions of a second-order ordinary differential equation. A qualitative steady-state theory is developed. (7 refs.)

61068 Quadrupole condensing lenses with a highly linear electric field distribution. A.B.Novgorodtsev (M.I. Kalinin Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1257-60 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2047-53 (Oct. 1982). [received: April 1983]

The electric field strength distribution is considered in quadrupole condensing lenses with polygonal electrodes, which are easier to fabricate than hyperbolic electrodes and give a strictly linear field distribution. The electrode profile is chosen to cancel the terms in the power series expansion of the complex field potential near the center of the system. Electrode configurations are determined which cancel the first, second, and third terms in the series expansion. The distribution of the field intensity gradient nonuniformities is investigated in the polygonal systems as well as in quadrupole condensing lenses having simpler electrodes (plates, angles, cylindrical surfaces). Recommendations are given for choosing the shapes of the electrodes to achieve a given degree of field gradient uniformity. (7 refs.)

61069 Properties of ion beams formed from a nonstationary plasma. T.A.Basova, Yu.K.Altudov, Yu.A.Bykovskii, Yu.N.Kolosov, V.N.Nevolin (Engng. Phys. Inst., Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1088-90 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1773-7 (Sept. 1982). [received: April 1983]

The phase volume of ion beams is investigated and the beam emittance for three different beam-extraction systems is determined. Calculation of the brightness of the source showed that it was higher than that of any other known ion source. A plasma ion source employing monochromatic emission has been used for implanting ions into different materials. (7 refs.)

61070 Dynamics of pulsed ion beam production by a plasma lens. I.S.Gasanov, I.M.Protchenko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1094-5 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1783-6 (Sept. 1982). [received: April 1983]

The results of experiments in which a pulsed beam of helium ions with energy up to 35 keV and current up to 50 mA is focused by a plasma lens are given. Information is given about the processes that determine the dynamics of formation and attenuation of electric fields in the lens. The focusing of the ion flux passing through the system occurs in the time required for considerable accumulation of electrons ejected from the walls of the cold compensator. At high residual-gas pressures the duration of effective operation of the

lens is limited by the time of accumulation of slow ions formed by ionization. (7 refs.)

42.10 PROPAGATION AND TRANSMISSION IN HOMOGENEOUS MEDIA

61071 Mach fringes as a physical phenomenon. H.Nieck (Sektion Phys., Martin-Luther Univ., Halle, Germany).

Exp. Tech. Phys. (Germany), vol.31, no.1, p.53-7 (1983). In German. Mach fringes can also be measured by physical radiation receptors, showing that they are a physical effect. From instantaneous photos it is shown that every moving diffusely reflecting bright face forms a dark fringe outside and a bright fringe inside at its limit with a dark face. Therefore a moving oblique face produces Mach fringes. Mach fringes at the limits of half-shade from an extended light source are interpreted by diffraction at a half-plane. (5 refs.)

61072 Rigorous coupled-wave analysis of grating diffraction—E-mode polarization and losses. M.G.Moharam, T.K.Gaylord (School of Electrical Engng., Georgia Inst. of Technol., Atlanta, GA, USA).

J. Opt. Soc. Am. (USA), vol.73, no.4, p.451-5 (April 1983). Rigorous coupled-wave theory of diffraction by dielectric gratings is extended to cover E-mode polarization and losses. Unlike in the H-mode-polarization case, it is shown that, in the E-mode case, direct coupling exists between all diffracted orders rather than just between adjacent orders. (6 refs.)

61073 Generalized curvilinear diffraction gratings. III. Euclidian diffraction gratings. R.A.Lee (Div. of Appl. Organic Chem., CSIRO, Melbourne, Victoria, Australia).

Opt. Acta (GB), vol.30, no.4, p.431-9 (April 1983). For p.II see *ibid.*, vol.30, no.3, p.291 (1983). Studies classes of plane uncrossed diffraction gratings which have the common property that their Fourier transform patterns consist of sharp-line caustics. These types of generalized gratings are referred to as 'Euclidian diffraction gratings', because the condition for the formation of line caustics is equivalent to the global vanishing of the Gaussian curvature of the grating line pattern function. The analysis is applied to the laser material processing system discussed in the last paper. (1 ref.)

61074 Generalized curvilinear diffraction gratings. IV. Plane singular crossed gratings. R.A.Lee (Div. of Appl. Organic Chem., CSIRO, Melbourne, Victoria, Australia).

Opt. Acta (GB), vol.30, no.4, p.441-7 (April 1983). For p.III see *ibid.*, vol.30, no.4, p.431 (1983). Discusses the Fraunhofer diffraction properties of plane crossed-line gratings which consist of a product of two uncrossed-line gratings. In particular, the author establishes a set of conditions which the grating functions must satisfy for the diffraction pattern to consist of a purely singular line pattern. For these singular gratings, the author shows that the diffraction pattern consists of a product of the orders of each uncrossed-line grating plus additional orders due to couplings between the separate gratings. (2 refs.)

61075 Generalized curvilinear diffraction gratings. V. Diffraction catastrophes. R.A.Lee (Div. of Appl. Organic Chem., CSIRO, Melbourne, Victoria, Australia).

Opt. Acta (GB), vol.30, no.4, p.449-64 (April 1983). The author shows how the bifurcation properties of two-dimensional potential functions may be studied via a diffraction grating representation. In particular, the author derives the grating functions appropriate to Thom's seven elementary catastrophes. The author then presents a detailed study of the cusp grating and discusses the behaviour of its point source image diffraction pattern (IDP) in the context of catastrophe theory. In this way, the author shows how catastrophe theory allows for a simple geometric interpretation of discontinuous type image diffraction patterns. (9 refs.)

61076 Spatial periodicities in partially coherent fields. A.W.Lohmann, J.Ojeda-Castaneda (Phys. Inst. Univ. Erlangen, Erlangen, Germany).

Opt. Acta (GB), vol.30, no.4, p.475-9 (April 1983). If the mutual intensity of partially coherent illumination is periodic in the lateral direction then it is also periodic in the longitudinal direction. This statement is proved for quasi-monochromatic light and for a cosine periodicity. Next an experimental set-up for the production of periodic mutual intensities is proposed. Finally, the theoretical result is generalized to other than cosine-shaped periodicities. (9 refs.)

61077 Fresnel diffraction of a Gaussian beam by one-dimensional opaque objects. C.Ozkul (Faculte des Sci. et des Tech., Univ. de Rouen, Mont-Saint-Aignan, France).

Opt. Acta (GB), vol.30, no.4, p.505-10 (April 1983). Fresnel diffraction fields of one-dimensional opaque objects under collimated Gaussian beam illumination are described. The irradiance distribution function is derived and the resultant formulae are compared with the case of uniform beam illumination. Experimental observation of irradiance as a function of position is in good agreement with numerically calculated results. (14 refs.)

61078 Modification of Fresnel diffraction by a straight edge object with acoustically coherence-controllable illumination. Y.Ohtsuka (Dept. of Engng. Sci., Hokkaido Univ. Hokkaido, Japan).

Opt. Acta (GB), vol.30, no.4, p.545-55 (April 1983). An attempt to modify a ringing fringe pattern of Fresnel diffraction is described. Fringe formation is heavily dependent on the illumination condition of partial coherence controlled by a progressive acoustic wave. Periodic envelope modification results in a fringe pattern due to periodicity of the acoustic wave. The ringing is appreciably suppressed near the geometrical shadow edge of the object. Successive maxima and minima of the fringe pattern are reversed if the acoustic power crosses over a critical level. (13 refs.)

61079 Diffraction efficiency of photochromic absorption gratings. T.Jaaskelainen (Dept. of Phys., Univ. of Kuopio, Kuopio, Finland). *Opt. Commun. (Netherlands)*, vol.45, no.3, p.145-8 (1 April 1983). Efficiencies of thick photochromic absorption gratings are theoretically investigated. The treatment is based on a realistic photochromic grating model,

which includes both spatial and temporal variations of the absorption coefficient. Simple analytic solutions for dynamic diffraction characteristics are derived. This nonlinear model shows that the maximum diffraction efficiency of photochromic absorption gratings may exceed 10%. (6 refs.)

61080 Reflection of a plane monochromatic wave from a medium with spatial dispersion. V.V.Yatsyshen.

Opt. & Spectrosc. (USA), vol.53, no.2, p.172-5 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.296-300 (Aug. 1982). [received: April 1983]

The problem of the reflection of an electromagnetic wave from a medium close to exciton resonance is investigated in the paper for the general case of oblique incidence. The question of whether the law of conservation of energy is satisfied in the case when an additional wave with spatial dispersion arises in the medium is considered. Since the distribution of energy between the reflected and refracted waves is regulated by the system of boundary conditions, limitations on the form of the additional condition and the remaining boundary conditions are found for which the law of conservation of energy is satisfied. It is shown that the system of inhomogeneous boundary conditions, including the inhomogeneous additional boundary condition and the condition of discontinuity of magnetic field at the boundary, is internally consistent for a specific relationship between the inhomogeneous terms of both conditions. (9 refs.)

61081 Orientation of an arbitrary ray, passing through a two-wedge compensator. G.A.Guzenko.

Sov. J. Opt. Technol. (USA), vol.49, no.7, p.433-5 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.30-2 (July 1982). [received: April 1983]

Universal mathematical expressions are obtained for the vertical and horizontal orientation angles of a ray, passing through a two-wedge compensator, for arbitrary direction of the incident ray and compensator position. (3 refs.)

61082 Retrieval and synthesis problems in optics—an overview. H.P.Baltes (Landis & Gyr Zug AG, Zug, Switzerland).

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.WA1/1-4

Presents a synopsis of the large variety of inverse problems in optical physics with emphasis on the underlying questions of uniqueness, stability and prior knowledge. Two specific examples are discussed. One is a deterministic problem on the level of electromagnetic inverse scattering, namely the design of grating profiles tailored to yield certain desired diffraction efficiencies. The other is a problem of statistical optics, namely the question of how a phase grating hidden behind a diffuser can be retrieved by observing the degree of coherence of scattered light. (4 refs.)

42.20 PROPAGATION AND TRANSMISSION IN INHOMOGENEOUS MEDIA

61083 Light scattering by bubbles in liquids: comments and application of results to circularly polarized incident light. P.L.Marston (Dept. of Phys., Washington State Univ., Pullman, WA, USA).

Appl. Sci. Res. (Netherlands), vol.40, no.1, p.3-5 (1983). Recently published Mie theoretic computations of the scattering of linearly polarized light from a bubble in water also apply, in certain cases, to the scattering of circularly polarized incident light. A correction to the labeling of one of the figures in the paper by Marston et al. (1982) is noted. (4 refs.)

61084 Second-order Rytov approximation. H.T.Yura (Aerospace Corp., Los Angeles, CA, USA), C.C.Sung, S.F.Clifford, R.J.Hill.

J. Opt. Soc. Am. (USA), vol.73, no.4, p.500-2 (April 1983). The authors obtain an explicit and useful formulation of the solution for the second-order Rytov approximation for an arbitrary source geometry. From this solution a condition of validity for the Rytov solution is obtained. The authors conclude that both the Born and the Rytov approximations have the same domain of validity. (10 refs.)

61085 Surface waves in backscattering and the localization principle. J.R.Probert-Jones (Dept. of Phys., Imperial Coll., London, England).

J. Opt. Soc. Am. (USA), vol.73, no.4, p.503 (April 1983). It is shown that use of the localization principle indicates that the spikes observed in the backscattering from large dielectric spheres cannot be due to surface waves. (8 refs.)

61086 Modification of the Rayleigh-Debye approximation. K.Shimizu (Res. Inst. of Appl. Electricity, Hokkaido Univ., Sapporo, Japan).

J. Opt. Soc. Am. (USA), vol.73, no.4, p.504-7 (April 1983). A modification of the Rayleigh-Debye approximation is given in two ways so that it includes the information of the refractive index of scatterers in the calculation of scattering patterns. The improvement that is due to the modification is demonstrated by comparing the approximation with the exact Mie calculation. (9 refs.)

61087 Measurements of Gaussian speckle statistics using both direct and heterodyne detection of CO₂ laser radiation. D.L.Jordan, R.C.Hollins (Royal Signals & Radar Estab., Malvern, England).

Opt. Acta (GB), vol.30, no.4, p.417-23 (April 1983). The characteristics of speckle patterns produced using scattered 10.6 μ m CO₂ laser radiation are described. At this wavelength, heterodyne detection offers

significant experimental advantages over direct detection of sensitivity and reduced contrast. As a simple illustration of heterodyne speckle techniques the heterodyne signals received from radiation scattered from a deep random phase screen are confirmed experimentally to follow a Rayleigh distribution. (9 refs.)

61088 Speckle intensity mean value dependence on the number of scatterers. B.Grzegorzewski, J.Mallek (Inst. of Math. & Phys., Acad. of Technol. & Agriculture, Bydgoszcz, Poland).

Opt. Commun. (Netherlands), vol.45, no.3, p.160-4 (1 April 1983). The number of scatterers contributing to the speckle amplitude can be determined by the spot size of the incident light or by the amplitude point spread function of the optical system. The speckle intensity mean value measurement results with two methods of choosing the number of scatterers applied are presented. The values of the RMS phase deviation and correlation length obtained from two methods agree well. The properties of both methods are discussed. The possibilities for the roughness measurement are suggested. (13 refs.)

61089 Parameters of the 'speckled pattern' formed when coherent radiation passes through opal glasses. N.A.Voishvillo, N.I.Sherbakova.

Sov. J. Opt. Technol. (USA), vol.49, no.7, p.413-15 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.12-15 (July 1982). [received: April 1983]

The dependence of the measured parameters of the 'speckled pattern' on the dimensions and shape of the aperture diaphragm of the receiver, the laser operating conditions, the diameter of the illuminating beam and the radiation scattering direction has been investigated. (9 refs.)

61090 Effects of the director of light scattered from an object on speckle interference patterns. L.Marti-Lopez (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1248-50 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2032-5 (Oct. 1982). [received: April 1983]

The influence of the scattered light director on the form of the diffraction halo is considered. The interference patterns are interpreted using the Young fringes in doubly exposed speckle photographs. It is shown that the form of the diffraction halo is determined by the output aperture of the optical system only when the aperture is completely and uniformly filled by light scattered by each point on the surface of the object. If this condition does not hold, the diffraction halo (and hence the transverse resolution achievable using speckle interference patterns) is determined by how the scattered light from point of the object passes through the aperture, as well as by the aperture diameter. (7 refs.)

61091 Experimental investigations of fluctuations of optical signals and disturbances in the atmosphere. E.R.Milyutin, Yu.I.Yaremenko (M.A. Bonch-Bruvich Electrical Engng. Inst. of Communications, Leningrad, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1357-8 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2088-90 (Oct. 1982). [received: April 1983]

An investigation was made of the statistical characteristics of signals and noise at the output of an optical detector placed at the end of a 500-m slightly inclined path. The probabilistic distribution law of the envelope of the background noise was determined for a single detector (receiver) aperture. A study was made of the distribution of the total signal in the case of coherent (linear) addition during direct tripled spatially separated detection for different degrees of atmospheric turbulence. An analysis was made of the experimental data. (1 ref.)

42.30 OPTICAL INFORMATION, IMAGE FORMATION AND ANALYSIS

61092 Plasma polymerized films for optical recording. Y.Asano, H.Yamazaki, A.Morinaka (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.480-4 (March 1983).

Metals containing plasma polymerized films have been investigated as media for laser thermal recording. The Te containing plasma polymerized carbon disulfide films (CS₂-Te) and Bi containing plasma polymerized carbon disulfide films (CS₂-Bi) are suitable for recording with respect to melting and vaporization, because they have low vaporizing temperature and low heat conductivity. In particular, the CS₂-Te unprotected antireflection structure showed the highest sensitivity. On the other hand, the CS₂-Te protective antireflection structure showed a lower sensitivity than the unprotected structure, but is preferable from the viewpoint of its high stability. The Te containing plasma polymerized styrene film is suitable for recording with respect to crystallization, because it shows a large optical change due to crystallization.

61093 Analysis of the shift-and-add method for imaging through turbulent media. B.R.Hunt (Dept. of Electrical Engng., Univ. of Arizona, Tucson, AZ, USA), W.R.Fright, R.H.T.Bates.

J. Opt. Soc. Am. (USA), vol.73, no.4, p.456-65 (April 1983).

The authors examine the statistical basis of the shift-and-add technique, by which true images of objects (viewed through fluctuating, distorting media) are formed by a particular kind of averaging of speckle images. The authors' theory agrees with experimental results for objects consisting of isolated unresolvable points. The authors develop a preliminary analysis for extended objects (i.e. objects having continuous, resolvable brightness distributions). (14 refs.)

61094 Effect of sample displacement in time-sequential sampling of spatiotemporal signals. J.P.Alebach (Dept. of Electrical Engng., Univ. of Delaware, Newark, DE, USA).

J. Opt. Soc. Am. (USA), vol.73, no.4, p.466-72 (April 1983).

Algorithms for digitally processing sampled spatiotemporal signals typically ignore the fact that those samples were obtained time-sequentially, rather

than instantaneously, at the beginning of each frame period. The effect of displacing time-sequentially obtained samples to a non-time-sequential lattice is analyzed for both deterministic and nondeterministic signals. Sample displacement is shown to cause unavoidable frequency-domain aliasing. The resulting artifacts are compared in test signals that have been sampled with a lexicographic and bit-reversed ordering of the sample points. (8 refs.)

61095 Extraction of difference using a polarization-shifted periodic carrier. A.Ghosh, A.K.Chakraborty (Dept. of Appl. Phys., Calcutta Univ., Calcutta, India).

Opt. Acta (GB), vol.30, no.4, p.425-30 (April 1983).

A method is proposed for subtracting two images using a polarization-shifted periodic carrier. The method has been successfully used to find the intensity gradient of a test object in the form of a transparency. Some experimental results are presented. (6 refs.)

61096 A comparison study of some computational methods for locating the zeros of entire functions. J.W.Wood, T.J.Hall, M.A.Fiddy (Dept. of Phys., Queen Elizabeth Coll., London, England).

Opt. Acta (GB), vol.30, no.4, p.511-27 (April 1983).

The zero description of entire functions of exponential type is reviewed. Serial and parallel methods of zero location from sampled data are introduced, and the results of applying these methods to simulated data are given. One method is also suitable for locating the zeros of finite-degree polynomials, and is thus particularly useful for use with the z transform of an input sequence. The relationship between the algorithms is discussed, and a recommendation of the most reliable method is given. (18 refs.)

61097 Periodic structures and the visual representation of phase objects in free space. V.A.Zverev, T.P.Kosobud, F.A.Markus.

Opt. & Spectrosc. (USA), vol.53, no.2, p.221-2 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.373-5 (Aug. 1982). [received: April 1983]

It is shown that periodic phase inhomogeneities can also be presented visually in free space by using gratings to introduce an additional modulation of the field. This method is similar to the method of defocused diaphragms but does not require the presence of lenses in the design of the apparatus for its implementation. By selecting the grating period one can make it more compact than in the method of defocused diaphragms. Still another advantage of visual representation in free space becomes apparent when investigating self-luminous inhomogeneities. In this method of visual representation the illumination is uniform over the whole plane of observation and introduces a smaller error. (5 refs.)

61098 Condition for the limiting resolution of optical systems for partially coherent illumination. A.D.Stolyarov.

Opt. & Spectrosc. (USA), vol.53, no.2, p.224-5 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.378-80 (Aug. 1982). [received: April 1983]

It is shown that to calculate the least resolvable distance between points it is sufficient to know the degree of coherence of the illumination and the transmission function of the optical system or the pupil function of the optical system. (3 refs.)

61099 A two-dimensional diffraction pattern sampling system for determining the optimum parameters of a matched spatial filter. S.Jutamulia, H.Fujii, T.Asakura (Res. Inst. of Appl. Electricity, Hokkaido Univ., Hokkaido, Japan).

Opt. & Laser Technol. (GB), vol.15, no.2, p.101-4 (April 1983).

The synthesis of a matched spatial filter based on holographic methods requires that the spatial frequency band in which the holographic fringe pattern with the best modulation is formed be tuned to the appropriate weighting at the Fourier transform plane of the spatial frequencies of the input object to be studied. For this purpose both the spectral intensity distribution of an input object at the Fourier transform plane and the intensity distribution of a reference beam at that plane must be accurately known beforehand. A two-dimensional diffraction pattern sampling system has been constructed which enables the Fourier spectral intensity distribution of the input object and the reference beam intensity distribution to be faithfully recorded. A preliminary experimental study shows the usefulness of this system. (8 refs.)

61100 Reconstruction of objects from coded images by simulated annealing. W.E.Smith, H.H.Barrett, R.G.Paxman (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).

Opt. Lett. (USA), vol.8, no.4, p.199-201 (April 1983).

A new Monte Carlo reconstruction procedure is presented for retrieval of objects from their coded images. The reconstruction process is modeled as an optimization problem whose cost function is related to how well the coded-image constraints are satisfied. Reduction of the cost function is achieved by an annealing process analogous to the cooling of a melt to produce an ordered crystal. The method is demonstrated by reconstructing two two-dimensional objects from their one-dimensional coded images. (10 refs.)

61101 Modulation transfer functions of a lens-array photographic system. B.K.Rozhkov.

Sov. J. Opt. Technol. (USA), vol.49, no.7, p.451-2 (July 1982). Translation of: *Opt.-Mekh. Prom-st. (USSR)*, vol.49, no.7, p.48-9 (July 1982). [received: April 1983]

It is shown that a lens-array photographic system is capable of forming a three-dimensional integral image having a modulation transfer coefficient that meets the requirements of practical photography. (11 refs.)

61102 Extraction of surface gradient from shading images. H.Kitagawa (Faculty of Sci. & Technol., Keio Univ., Yokohama, Japan), M.Suzuki, H.Fujita.

Trans. Inst. Electron. & Commun. Eng. Jpn. Part D (Japan), vol.166D, no.1, p.65-72 (Jan. 1983). In Japanese.

A method for extracting the surface gradient of bodies was developed by using shading images. The object is irradiated by a light source and observed by a camera. The light source moves around the optical axis of the camera, so that the irradiance at each image point varies sinusoidally. From this varying irradiance, one can obtain a particular surface gradient. The shape was measured with an experiment of a polyhedral object. In this case, one could also obtain the edge information. With the knowledge obtained from gradient and edge informations, a polyhedral object was reconstructed accurately. (10 refs.)

42.40 HOLOGRAPHY

(for acoustic holography, see 43.63)

61103 Conditions of stigmatism of holographic concave gratings used in normal incidence. M.Pouey (Univ. Paris-XI, Orsay, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.4, p.225-7 (31 Jan. 1983). In French.

Actual design rules for holographic concave grating devices are derived from peculiar solutions of the tangential focus equation. However, for normal incidence devices, by satisfying the Fermat principle independently in the object and the image space, a new focusing condition for the location of the stigmatic coma-free points could be derived. This condition is obtained by considering first the conditions for which the third order aberration terms vanish. The object may be located anywhere on the spherical holographic grating's normal (radius of curvature R), the locus of the diffracted images being a circle, whose radius is proportional to R and the grooves density, and passing through the summit and the curvature centre of the grating. (6 refs.)

61104 Influence of partial coherence and misalignments on holographic methods (single and double exposure) of adding or subtracting pictures. R.Hild, S.Kessler (Sektion Phys., Friedrich-Schiller Univ., Jena, Germany).

Exp. Tech. Phys. (Germany), vol.31, no.1, p.1-9 (1983). In German.

General results are given for the influence of coherence and misalignments on the complex amplitude addition and subtraction by two holographic methods. One method is holographic Fourier transformation and the other is subtraction via processing simultaneously recorded holographic images. (6 refs.)

61105 Cascaded phase Fourier holograms. J.Slaby, T.Szoplik, K.Chalasinska-Macukow (Warsaw Univ., Warsaw, Poland).

Opt. Acta (GB), vol.30, no.4, p.529-43 (April 1983).

A stacked system of phase Fourier holograms on which binary information is recorded has been built and its performance studied. The properties of the zero-order beam propagating through the stack have been investigated. The results show how the energy and intensity distributions of the read-out beam change as the beam propagates through the system, and the values of the imaging efficiency η_n of successive holograms and the signal-to-noise ratio (S/N) are measured in successive reconstructed images. The evolution of the zero-order beam is described mathematically. (17 refs.)

61106 Fresnel detour-phase circular computer generated holograms. H.Y.Wu, P.Chavel, D.Joyeux, J.Brunol (Inst. d'Optique, Univ. de Paris-Sud, Orsay, France).

Opt. Commun. (Netherlands), vol.45, no.3, p.155-9 (1 April 1983).

When a circularly symmetric wavefront has to be encoded onto a computer generated hologram, it is highly desirable to preserve the symmetry. The coding scheme must therefore be circularly symmetric itself. This paper introduces a particular kind of computer generated hologram which extends circular symmetry to the detour phase technique; this is obtained by working in Fresnel diffraction. The wavefront should be sampled using a circular sampling theorem such as the one derived from the Dini-Bessel expansion. The hologram then consists of weighted unit masses distributed on a set of circles, which in practice are replaced by annuli of suitable inner and outer radii. The approximations due to the detour phase method and to the annuli widths are discussed and an experimental example is shown. (13 refs.)

61107 Method of analyzing wave aberration of a two-component holographic objective. V.G.Shitov, G.I.Greiskuh, V.A.Vanin, M.M.Butusov.

Opt. & Spectrosc. (USA), vol.53, no.1, p.76-8 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.130-4 (July 1982). [received: April 1983]

A method is given for calculating the monochromatic wave aberration of a diffraction objective consisting of two closely placed holographic lenses. The method is based on an analysis of the phase of the wave front reconstructed by the objective and expressed in radicals. (6 refs.)

61108 Use of a holographic diffraction grating for deflecting a laser beam. N.G.Kiselev.

Opt. & Spectrosc. (USA), vol.53, no.1, p.79-82 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.135-40 (July 1982). [received: April 1983]

The properties of a holographic diffraction grating as an element for deflecting a laser beam are considered. It is shown that by comparison with traditional deflecting elements, such as a mirror and a glass prism, the holographic diffraction grating possesses wider functional possibilities. An analysis is made of a deflecting device based on a holographic diffraction grating whose plane is orthogonal to the axis of rotation. It is shown that on the basis of such a scheme it is possible to construct a deflecting device that is satisfactory for many practical applications regarding both the linearity of deflection as well as the curvature of the lines formed. Compared with a known deflecting device, such as a mirror drum, the proposed device is much less massive and has a low sensitivity to angular displacements (shaking) of the axis of rotation. (7 refs.)

61109 Infrared-spectrophotometric investigation of the recording of an optical image on dichromated gelatin. A.L.Kartuzhanskii, V.M.Kalyuzhnyi, A.A.Krut, V.A.Tsendrovskii.

Opt. & Spectrosc. (USA), vol.53, no.2, p.225-6 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.380-2 (Aug. 1982). [received: April 1983]

The experience acquired by the authors in a previous IR spectrophotometric study enables them to apply the same approach to studying the processes in dichromated gelatin and to understand why different specimens of gelatin possess different phototanning abilities and the effect of the different diffraction efficiency on the holographic gratings recorded on them. The photo-

graphic process in dichromated gelatin, from the point of view of its structural changes, can be interpreted as follows. Chromating intensifies the bands connected with vibrations in the amine and hydroxyl groups of the gelatin macromolecule. The bands shorter than 1000 cm^{-1} that appear belong to vibrations of the groups of the chromium complex bound to water. Illumination partially destroys and disorders the complexes, blurring and reducing the intensity of all the bands characteristic of them. Simultaneously, the intensity of the vibrational bands of the hydroxyl groups, bound to the gelatin macromolecule is increased. Development practically destroys all the chromium complexes and their bonds with the water molecules, returning the degree of hydration of the macromolecule to its initial state. A layer of dichromated gelatin on a base of strongly hydrated gelatin with a large number of carboxyl groups in the side chains should have the highest light sensitivity and diffraction efficiency. (5 refs.)

61110 HS-1 holocamera. Z.Jankiewicz, W.Nowakowski, W.Bobak. *Pol. Tech. Rev. (Poland)*, no.5-6, p.10-12 (1982).

The HS-1 holographic camera is designed for investigating the deformation of objects using double-pulse holographic interferometry methods. This unique measuring system has been built for fundamental research laboratories, but its mobile structure makes it also suitable for performing measurements in industrial conditions. A diagram of the optical-mechanical assembly mounted on a platform resting on a TV tripod is shown and its technical data given. (1 ref.)

61111 Real-time holographic interferometry of moving objects in oppositely directed beams. N.V.Morozov, Yu.I.Ostrovskii, L.M.Boeva (A.F. Ioffe Physico-techn. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1137-9 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1854-8 (Sept. 1982). [received: April 1983]

The distinctive features of holographic interferograms obtained in real time are investigated for the case in which a reflection hologram of the initial state of the object is recorded in oppositely directed beams. It is shown that the deformation of objects moving translationally can be studied by real-time holographic interferometry when the hologram is rigidly fixed relative to the object and moves together with it. An analysis yields the admissible values of the translational and angular displacements of the object-hologram system in real-time observation. The optimal conditions for recording the hologram and interference fringes are also discussed. (5 refs.)

61112 On obtaining a specified light-field distribution. T.D.Ebralidze (Inst. of Cybernetics, Acad. of Sci., Tbilisi, Georgian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1144-6 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1865-8 (Sept. 1982). [received: April 1983]

The holographic recording and reconstruction of a light wave having some original direction of polarization is investigated. It is shown that to reconstruct from a hologram the object and reference waves with the original directions of polarization it is sufficient to reproduce, at every point in the hologram, linearly polarized light having a certain amplitude and the direction of the polarization vector. (7 refs.)

61113 Self-consistent choice of code and phase mask for improving uniformity of Fourier hologram interference patterns. V.S.Vorozheikin, S.A.Shoidin. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1242-5 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2022-6 (Oct. 1982). [received: April 1983]

The structure of the phase mask is matched with the data word length and selected according to code combinations in order to improve uniformity in Fourier hologram interference patterns. It is then possible to reduce the probability that all or most of the open cells in the transparency lie on regions of the phase mask with identical phase [for a given code, such a pattern corresponds to recording an unlikely (in practice, extremely unlikely) message]. The probability of phase-coincident cells decreases with increasing word length, and the structure of the phase mask is also simplified. (5 refs.)

61114 Holographic intensity correlator with a laser electron beam tube for inputting images for processing. V.I.Kozlovskii, A.S.Nasibov, O.I.Potaturnik, P.V.Reznikov, Ya.K.Skasyrskii, B.I.Spektol (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1245-7 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2027-31 (Oct. 1982). [received: April 1983]

Optical processing of images (including real-time images) input as electrical signals is considered. The use of a laser electron beam tube is proposed to input the images into an optical processor and an optical system consisting of a holographic intensity correlator. The incoherence of the laser light then permits linear image processing (in terms of intensity). Experimental results are reported. (7 refs.)

61115 Contributions of amplitude and phase modulation to diffraction efficiency in three-dimensional reflective holograms. A.V.Alekseev-Popov, S.A.Gevelyuk (I.I. Mechnikov Sci. Res. Inst. of Phys., Odessa State Univ., Odessa, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1289-91 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2100-2 (Oct. 1982). [received: April 1983]

It is demonstrated that concurrent phase and amplitude modulation alters the qualitative form of the angular selectivity curves in three-dimensional reflecting holograms. It is possible and indeed desirable to use the algorithm to calculate the amplitude and phase modulation coefficients when analyzing reflecting holograms. (5 refs.)

61116 Light refraction in crystals with bipolar photoconductivity. S.I.Stepanov (A.F. Ioffe Physico-techn. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1300-1 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2114-16 (Oct. 1982). [received: April 1983]

Analyzes theoretically the main features of holographic recording. It is shown that bipolar photoconductivity in a light-refracting crystal has an appreciable effect on the steady-state hologram grating amplitude when the hologram is recorded in the absence of an external electric field. (9 refs.)

61117 Data storage in a holographic archive with the aid of an optically controlled transparency. T.A.Belozherova, A.A.Komlev, N.F.Kovtonyuk, S.S.Kuz'min, A.L.Mikaelyan. *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1368-70 (Oct. 1982). Translation of: *Kvantovaya Elektron. Moskva (USSR)*, vol.9, no.10, p.2102-4 (Oct. 1982). [received: April 1983]

Data were stored in a holographic archive memory using an optically controlled transparency. The requirements which the transparency should satisfy for the use as an input original were determined. A liquid-crystal transparency used is described. A report is given of the characteristics of an image obtained using such a transparency and also of an image reconstructed from a

hologram recorded with the aid of the transparency. Ways of improving the image quality are indicated. (4 refs.)

61118 Synthesis of optical elements giving a focal line of arbitrary shape. V.A.Danilov, V.V.Popov, A.M.Prokhorov, D.M.Sagatelyan, I.N.Sisakyan, V.A.Solifer (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.351-3 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.810-15 (July 1982). [received: April 1983]

The authors are interested in the synthesis of optical elements which can produce a planar focal line of arbitrary shape. These elements have an important property, which may be called 'modularity': Parts of one element can, independently, produce different curves, so that quite complicated figures can be produced. Optical elements of this type may be of interest in various fields of science, engineering, and technology. The procedure for synthesizing a focuser (computer-synthesized kineform elements) consists of the following independent steps: 1) The construction of a mathematical model and the derivation of equations for the phase function of the focuser; 2) computer calculation of the phase function of the focuser; 3) creation of the calculated phase function on a physical carrier. (7 refs.)

61119 Time-varying light amplification by dynamic holograms in spatially nonuniform light beams. A.M.Dukhovnyi, D.I.Stasel'ko. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.436-7 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.1009-14 (Aug. 1982). [received: April 1983]

Reports a study of the time-varying-intensification of weak beams by dynamic holograms in media having an inertial local response ('unbiased' dynamic holograms) in the case in which the intense beam has an amplitude-phase distribution with a small-scale nonuniformity. (11 refs.)

42.52 MASERS

61121 Rydberg-atom masers. I. A theoretical and experimental study of super-radiant systems in the millimeter-wave domain. L.Moi, P.Goy, M.Gross, J.M.Raimond, C.Fabre, S.Haroche (Lab. de Phys., Ecole Normale Supérieure, Paris, France). *Phys. Rev. A (USA)*, vol.27, no.4, p.2043-64 (April 1983).

The operation of maser devices using highly excited Rydberg atoms as active medium is investigated. These systems, working in a transient regime, reminiscent of super-radiance generate few-hundred-ns-long bursts of mm-wave radiation. They are characterized by extremely low inversion density thresholds ($N_0 \sim 10^4$ atoms typically) and very small peak power outputs (in the 10^{-11} to 10^{-33} watt range). This study is interesting in the context of new tests of super-radiance and electrodynamics theory. It also opens new possibilities in the important domain of mm-wave amplification and detection. In this paper, the authors present a simple semiclassical theory of transient Rydberg maser operation and they report the experimental observation of a large number of maser emission lines on Na atoms, spanning a wide frequency interval ($60 < \nu < 950$ GHz). The technique used to monitor the emission is the indirect field ionization procedure which reveals fast radiative transfers occurring between Rydberg levels. Another method involving the direct detection of the maser radiation by a heterodyne receiver is described in a subsequent paper, along with a report on the investigation of various effects related to the triggering of the transient maser emission by external radiation. (23 refs.)

61122 Rydberg-atom masers. II. Triggering by external radiation and application to millimeter-wave detectors. P.Goy, L.Moi, M.Gross, J.M.Raimond, C.Fabre, S.Haroche (Lab. de Phys., Ecole Normale Supérieure, Paris, France).

Phys. Rev. A (USA), vol.27, no.4, p.2065-81 (April 1983). For pt.I see *ibid.*, vol.27, no.4, p.2043 (1983). The 'triggering' of transient maser systems using excited Rydberg atoms as active medium is investigated theoretically and experimentally. The authors show how the maser pulse characteristics are modified by the interaction of the active medium with small amounts of resonant mm-wave radiation. The phase, polarization, and emission delay of the radiated field are modified by this triggering: this can be used to detect very small powers of mm- or sub-mm-wave radiation. A complete discussion of the quantum and thermal noise of these detectors is presented. A demonstration of the feasibility of this technique is reported. Triggering signals corresponding to a detectivity of $3 \times 10^{-17} \text{ W/Hz}^{1/2}$ at 108 GHz ($\lambda = 2.8 \text{ mm}$) have been measured at room temperature. The quantum-

noise limit—corresponding to 6×10^{-19} W/Hz^{1/2}—should be reached with liquid-helium-temperature-cooled detectors. (14 refs.)

42.55 LASING PROCESSES

61123 Induced decay of positronium and grasers. D.M.Heffernan, R.L.Liboff (Dept. of Phys., Cornell Univ., Ithaca, NY, USA). *Int. J. Theor. Phys. (USA)*, vol.22, no.2, p.193-206 (Feb. 1983). The differential cross section and the total cross section for the stimulated decay of positronium by an incident photon of frequency ω is calculated as a function of the dimensionless variable $\xi = \hbar\omega/mc^2$. For $\xi \gg 1$ the total cross section is found to decrease as ξ^{-2} . The authors also look at the particular case of positronium in a black-body radiation field. Expressions for the number of induced annihilations per second as functions of the dimensionless ratio mc^2/kT and the number of positronium atoms are obtained. It is found that this rate is proportional to (kT/mc^2) for $kT \leq mc^2$ and to $(kT/mc^2) \ln(kT/mc^2)$ for $kT \gg mc^2$. The possibility of utilizing induced two-photon decay of positronium as a γ -ray laser at the wavelength $\lambda_c/2$ is examined, where λ_c is the Compton wavelength. (13 refs.)

42.55B General theory of lasing action

61124 Wave propagation in media with focused gain. B.N.Perry, P.Rabinowitz, M.Newstein (Corporate Res. Sci. Lab., Exxon Res. & Engng. Co., Linden, NJ, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.1989-2002 (April 1983). A solution of the scalar wave equation in a rotationally symmetric focused Gaussian amplifying medium is constructed from coupled Gaussian-Laguerre solutions of the free-space wave equation and is formally exact. The solution allows for the construction of the characteristic eigenmodes of the system and has direct application to Raman lasers, dye lasers, and the free-electron laser. The eigenvalues corresponding to the eigenmodes are directly related to mode growth rates and phase velocities. Numerical results for single- and multiple-pass growth are evaluated and exhibit an unpredicted gain enhancement that can be related to the phenomenon of 'gain focusing' first described for uniform parabolic gain distributions. The solution for a focused parabolic gain distribution is also presented. Output intensity distributions are found for initial conditions corresponding to spontaneous emission and to a specified initial field. The same method of solution can be applied to a medium with a focused Gaussian refractive index. (20 refs.)

61125 Pressure wave attenuation due to anode mufflers in pulsed lasers. B.N.Srivastava (Avco Everett Res. Lab. Inc., Everett, MA, USA). *AIAA J. (USA)*, vol.21, no.3, p.381-9 (March 1983). The paper addresses some new technical aspects of acoustic suppression in an open cycle pulsed laser device. An open cycle pulsed CO₂ laser system has been studied in order to predict the effect of various acoustic design parameters on the cavity clearing process. More specifically, the effect of an anode muffler (commonly used for transverse wave attenuation), in combination with a downstream acoustic horn, on the cavity-generated longitudinal waves is discussed by developing numerical solutions of the flow conservation equations. The results presented suggest that anode mufflers can provide an effective means of achieving rapid acoustic clearing in the laser cavity. (13 refs.)

61126 Stabilisation of carbon dioxide lasers using the Stark effect. S.A.Rackley, R.J.Butcher (Cavendish Lab., Univ. of Cambridge, Cambridge, England). *J. Phys. D (GB)*, vol.16, no.4, p.505-16 (14 April 1983). A large number of Stark-tuned molecular absorptions have been investigated as possible references for Stark stabilisation of waveguide CO₂ lasers. A set of potentially useful absorptions have been selected and transition tuning rates, absorption coefficients, and electrical breakdown characteristics have been measured for a number of these. A discussion of the optimisation of a Stark stabilisation system is given. Predictions of absorptions that will be useful in stabilising isotopic lasers are also reported. (17 refs.)

61127 LIMP in continuously coupled unstable resonators. E.K.Gorton, P.J.Gorton, E.W.Parcell (Royal Signals & Radar Estab., Great Malvern, England). *J. Phys. D (GB)*, vol.16, no.4, p.517-24 (14 April 1983). The Laser Induced Medium Perturbation (LIMP) effect is shown to be a volumetric effect which plays a significant role in the beam quality obtainable from a CO₂ laser employing a continuously coupled unstable resonator. 61128 Pumping of gas lasers by runaway-electron beams. P.A.Bokhan, A.R.Sorokin (Inst. of Thermal Phys., Acad. of Sci., Novosibirsk, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.411-12 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.947-50 (Aug. 1982). [received: April 1983]
Shows that pumping by runaway electron beams can be used to arrange lasing in a variety of working media. The lasers were pumped in a cell 1 cm in diameter and 10 cm long with an accelerator gap of 0.7 mm. There was a

transverse injection of electrons through a grid with a geometric transparency of 50%. Results are presented by a He-Hg laser with an output wavelength of 615 nm. Measurements of output energy, output pulse length, and delay in the onset of lasing with respect to the maximum of the beam current are reported. Applications to a He-Xe laser are also briefly discussed. (5 refs.)

42.55H Lasing action in other gas lasers

61129 Temporal measurement of the gain of a CuCl laser. K.Kuroda, M.Takeda, M.Chihara, I.Ogura (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan). *J. Appl. Phys. (USA)*, vol.54, no.4, p.1670-4 (April 1983). The temporal behaviour of the population inversion density of a CuCl laser was investigated using the gain method. The amplifier model which included the effect of the pumping during the amplification was discussed and used to analyze the experimental data. The populations of the laser transition levels were inverted during about 50 ns in the laser. The mechanism of the construction and destruction of the population inversion was discussed using the numerical model of a CuCl laser, and the variation of the electron temperature would be the main cause of the behavior of the population inversion density. (14 refs.)

61130 High repetition rate operation of a N₂ waveguide laser. R.Buffa (Istituto de Elettronica Quantistica del Consiglio Nazionale delle Ricerche, Firenze, Italy). *J. Phys. D (GB)*, vol.16, no.4, p.167-9 (14 April 1983). The high repetition rate operation of a capacitively-coupled-discharge, low-dielectric waveguide laser is reported. By using superfluorescent nitrogen as the active medium, a laser pulse output of energy 2.5 μ J and duration 2 ns has been achieved. A pulse repetition rate as high as 100 p.p.s. has been obtained without gas flow but with cooling of the gas by heating transfer to the cell walls after every discharge pulse. (7 refs.)

61131 Effect of capture on the beat contour of oppositely traveling waves in a ring gas laser. Yu.M.Golubev, V.P.Gryaznevich. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.202-3 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.346-8 (Aug. 1982). [received: April 1983]
In the widely used He-Ne laser operating at a wavelength of 0.63 μ m, the spontaneous emission from the upper working level is effectively captured. Capture may, however, have a nontrivial effect in that when the population of the upper level is being formed it interferes with the lasing. Hence, in addition to the separate action of capture and emission, the results of which are quite obvious one would expect there to be a more complex effect, which the authors analyze. The authors carry out a theoretical analysis in the framework of quantum electrodynamics using the kinetic-equation method for the density matrix of the emission field. (4 refs.)

61132 Noise measurement in a He-Zn hollow cathode laser tube. T.Iijima (Coll. of Technol., Seikei Univ., Tokyo, Japan). *Physica B & C (Netherlands)*, vol.115 B+C, no.2, p.257-60 (Jan. 1983). The noise in a He-Zn hollow cathode laser tube with long life and stable operation was measured. The fluctuation of laser power at 758 Å in Zn II for a short period of time was compared with those of He I, Zn I and Zn II spectral line intensities. In the laser noise spectrum, the apparent peaks and periodic oscillation have not been observed in the range of 0-10 MHz. The laser light noise measured under the optimum operating conditions was 0.3% (RMS). By the addition of a small amount of neon, the laser light noise was somewhat suppressed. (9 refs.)

61133 New supersonic lasers at very low temperature and high density. B.Fontaine, B.Forestier (Inst. de Mecanique des Fluides de Marseille, Univ. d'Aix-Marseille-II, Marseille, France). *Rev. Cethedec (France)*, vol.19, no.NS82-2, p.55-80 (1982). In French. Data obtained for ultraviolet and visible high energy lasers with supersonic flow and excitation either by an electron beam or by a discharge assisted or stabilised by e-beam or X-rays are presented. The positive effects of an important temperature decrease are underlined. Moreover the effects of a supersonic flow on the optical properties of the active medium are discussed. The prospects of high energy short wavelength are envisaged. (21 refs.)

61134 Study of the infrared absorption of carbon tetrafluoride at 9 μ m. J.Dupre, C.Meyer, G.Poussigue, G.Tarrago (Travaile Realise au Lab. d'Infrarouge, Univ. de Paris-Sud, Orsay, France). *Rev. Cethedec (France)*, vol.19, no.NS82-2, p.143-54 (1982). In French. The CF₄ molecule can be pumped by a CO₂ laser to give a vibrational laser emitting at 16 μ m. In order to get a better understanding of the functioning of this laser, the authors have analysed the infrared absorption of the $\nu_3 + \nu_4$ CF₄ band at 9 μ m. This analysis, extended to J=40, leads to the identification of 2300 rovibrational transitions which could be reproduced by the model with a standard deviation of 0.003 cm⁻¹. From this study, a complete list of CF₄ transitions has been tabulated located within ± 0.050 cm⁻¹ of any line of ¹²C¹⁶O₂ and ¹²C¹⁸O₂ lasers. (5 refs.)

61135 A mechanism for producing inversion in gas lasers. B.I.Grinenko (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1163-4 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1892-4 (Sept. 1982). [received: April 1983]
A new approach to the kinetics of the formation of inversion in certain types of gas lasers by means of charge transfer reactions of singly and doubly charged ions with excited atoms. Although this reaction, according to calculations, plays an important role in the kinetics of a large group of lasers including metal vapor lasers, the active media are discussed in great detail and the existing interpretations of the basic processes of formation that have been advanced are, for a number of reasons, insufficiently persuasive. (15 refs.)

61136 Pumping of pulsed gas lasers by bulk and sliding spark discharges. E.P.Bel'kov, P.N.Dashuk, G.L.Spichkin (M.I. Kalinin Polytech. Inst., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1216-18 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1979-82 (Oct. 1982). [received: April 1983]
Results are reported from an experimental study of bulk discharge formation in inert gas mixtures containing an electronegative gas when a bulk discharge is produced using a sliding spark along the surface of a titanium-containing ceramic. A capacitor (dielectric ceramic plate) was repeatedly charged during

the time the slipping discharge developed along the surface of the ceramic, and the capacitor discharged into the primary winding of a pulse transformer. The secondary winding of the transformer was powered by a voltage pulse ≤ 120 kV of duration ~ 100 ns which was used to ignite the bulk discharge. The power characteristics of the bulk discharge are reported. (3 refs.)

61137 Efficiency of a stimulated Raman scattering laser using a medium with population inversion. A.S.Eremenko, S.N.Karpukhin, A.I.Stepanov. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1240-2 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2018-21 (Oct. 1982). [received: April 1983]

A simplified method is proposed for solving the equations describing a stimulated Raman scattering laser using a medium with population inversion. The output signal and efficiency of a stimulated Raman scattering laser are calculated as a function of the duration of a coherent pumping square-wave pulse for the example of photodissociation of CF_3 and $\text{C}_3\text{F}_7\text{I}$. Methods are given for optimizing laser operation to increase the efficiency. (6 refs.)

61138 Thermal physics of transverse-discharge copper vapor lasers. B.L.Borovich, R.A.Grigoryan, G.P.Kazeko, G.N.Nikolaev, V.M.Smirnov. *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1289-95 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.1983-92 (Oct. 1982). [received: April 1983]

One of the factors determining the ultimate characteristics of copper vapor lasers is the heating of the active medium by the pulse-periodic discharge providing the excitation. The gas temperature was measured on the axis of the discharge gap of a transversely excited copper vapor laser. Two methods were used: a spectroscopic method (based on the Doppler width of an emission line on the neon buffer gas) and an interferometric method (based on the fringe shift in a Mach-Zehnder interferometer at the instants when the discharge was switched abruptly on and off). Both methods yielded values close 2200K. The temperature distribution in the active zone with a rectangular cross section was computed numerically. The results of a theoretical calculation were used to estimate the efficiency of conversion of the discharge energy into heat, which was around 40%. (14 refs.)

61139 Quasi-CW lasing due to transitions from the resonance 1P_1 to the metastable 3D_2 level of the calcium atom. V.M.Batenin, S.V.Kalinin, I.I.Klimovskii (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1345-7 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2075-7 (Oct. 1982). [received: April 1983]

A description is given of the method and the results are reported of an experiment in which quasi-CW lasing was obtained as a result of transitions from a resonance to a metastable level of the calcium atom without the use of any special impurities to quench the lower metastable state. Under these experimental conditions the metastable level was depopulated not as a result of collisions of the second kind or as a result of a chemical reaction, but because of the ionization, electron-impact excitation, and diffusion of metastable atoms to the discharge tube wall. (12 refs.)

61140 Excimer lasers using fission-reactor ionization. G.A.Batyrbekov, S.A.Kostritsa, Yu.E.Kuz'min, A.B.Teluzhanov, M.U.Khasenov (Inst. of Nuclear Phys., Acad. of Sci., Alma-Ata, Kazakh SSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.341-2 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.789-91 (July 1982). [received: April 1983]

Considerable interest has recently been attracted to the development of excimer lasers with working volumes of tens of liters and pulse repetition frequencies of tens of kilohertz. The neutron flux of a steady-state nuclear reactor makes it possible to uniformly ionize a gas volume of tens of liters, and the electrical energy required to pump the excimer laser can be generated at the same reactor. The authors report a diagnostic study of the plasma produced in the radiation field of a steady-state nuclear reactor in the active mixtures $^3\text{He} + \text{Xe} + \text{NF}_3$ and $^4\text{He} + \text{Xe} + \text{CCl}_4$. The charge-carrier density was determined from the voltage-current characteristics of the steady-state, externally sustained discharge. (8 refs.)

61141 Influence of characteristics of the spark gap on the output energy in a Blumlein type nitrogen laser. A.Nomura, N.Takagishi, Y.Saito, T.Kano (Faculty of Engng., Shinshu Univ., Nagano, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan)*, vol.166C, no.1, p.102-3 (Jan. 1983). In Japanese.

In the Blumlein type nitrogen laser, the residual inductance and resistance of the spark gap circuit were measured under a variety of conditions of pressure and electrode distance of the spark gap. The influences of these circuit parameters on the laser output energy were examined. (2 refs.)

61142 Theoretical simulation of a pulsed HF optical resonance transfer laser. S.Yamaguchi, K.Kumamoto, F.Kannari, M.Obara, T.Fujioka (Dept. of Electrical Engng., Keio Univ., Yokohama-shi, Japan). *J. Appl. Phys. (USA)*, vol.54, no.4, p.1675-85 (April 1983).

The high-efficiency pulsed HF Optical Resonance Transfer Laser (ORTL) is described in this paper. The multiline laser output, pulse shape, pulse width, and efficiency were all calculated by using the HF computer codes which have been developed in the authors' laboratory. Parametric studies were also done to optimize system efficiency and, as a result, the ratio of laser output

energy to pumping energy was as large as 56%. The lasing lines of the ORTL covered the wavelength region between 3.0 and 3.8 μm . Comparison of the results of this simulation with the experiments of CW-ORTL shows that the pulsed ORTL could be more efficient operation. (14 refs.)

61143 Flashlamp-pumped iodine monobromide laser characteristics. L.E.Zapata (Miami Univ., Oxford, OH, USA), R.J.De Young. *J. Appl. Phys. (USA)*, vol.54, no.4, p.1686-92 (April 1983).

The operating characteristics of a flashlamp-pumped IBr laser were investigated to evaluate its suitability for solar-pumped laser applications. A peak power of 350 W/cm² at 2.7 μm was achieved at 12-Torr IBr pressure. At 500-J flashlamp energy, the IBr output saturated; a gain of 0.17% cm⁻¹ was measured for IBr. Neon was found to be effective for enhancing the recombination of the photodissociation products. With neon as a buffer gas, the laser pulse length was extended to 53 μsec . The termination of the laser pulse, within the flashlamp pulse, is thought to be due to the temperature rise in the gas. Increasing the IBr initial temperature decreased the lasing output. At 300°C, output dropped to approximately one-half the room temperature value. The dominant quencher is thought to be atomic iodine. IBr was found to couple better to the flashlamp energy than $\text{C}_3\text{F}_7\text{I}$. (12 refs.)

61144 Localization of a light beam in a narrow inverted zone formed as a result of chemical processes in parallel streams of reagents. V.A.Kochelap, L.Yu.Mel'nikov (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1352-4 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2083-5 (Oct. 1982). [received: April 1983]

It is shown theoretically that injection of an optically dense jet between two parallel planar streams establishes a dielectric gas waveguide which localizes light in a narrow reaction zone. It then becomes possible to use narrow inversion zones (with a thickness of the order of 10^{-2} cm) in CW chemical lasers without suffering the diffraction losses of light. This waveguide effect should make it possible to use gas streams at pressures ≥ 1 atm in chemical lasers. A fast chemical reaction, $\text{Ba} + \text{S}_2\text{Cl}_2 \rightarrow \text{S}_2(\text{B}) + \text{BaCl}_2$, resulting in the emission of visible light is considered by way of example. (13 refs.)

61145 Intrinsic pulsation induced by lateral carrier waveguiding in stripe geometry DH semiconductor lasers. Guo Changzhi, Wang Kaige (Dept. of Phys., Peking Univ., Peking, China).

Chin. J. Semicond. (China), vol.4, no.2, p.161-70 (March 1983). In Chinese. Effects of lateral optical and carrier distributions and their interaction on dynamic processes in stripe geometry DH semiconductor lasers are analyzed theoretically. The rate and field equations are simultaneously solved in rather strict manner for numerical transient solutions. The results calculated show that when the index waveguiding of the carrier distribution and the carrier diffusion become pronounced, 'intrinsic' pulsation characterized by the lateral optical beam width with continuous and significant oscillation during pulsation may occur in the laser output in a certain range of injected current. (21 refs.)

61146 An investigation on visible-infrared GaAlAs lasers. Zheng Guangfu, Liao Xianbing, Zheng Xianming, Hu Enzhi (Inst. of Semiconductor Optoelectronics, Yongchuan Sichuan, China).

Chin. J. Semicond. (China), vol.4, no.2, p.200-5 (March 1983). In Chinese. Visible GaAlAs lasers with CW operation at room temperature and lasing wavelength of ~ 7600 Å, have been achieved. Their electrical and optical parameters are similar to those of infrared GaAlAs lasers. The lasing wavelength of infrared GaAlAs lasers is ~ 8800 Å, at room temperature the CW life is of the order of magnitude of 10^4 hours, and the highest CW operating ambient temperature can be as high as 150°C. (3 refs.)

61147 Stress tests on 1.3 μm buried-heterostructure laser diode. T.Ikigami, K.Takaei, M.Fukuda, K.Kuroiwa (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

Electron. Lett. (GB), vol.19, no.8, p.282-3 (14 April 1983). Preliminary results of the accelerated aging test under stresses of temperature and current are presented. The degradation modes are found to be divided into two patterns which can be mapped in co-ordinates of these stresses. (2 refs.)

61148 Comparison of noise characteristics of Fabry-Perot-type and travelling-wave-type semiconductor laser amplifiers. J.C.Simon, J.L.Favennec (CNET, Lannion, France), J.Chariel.

Electron. Lett. (GB), vol.19, no.8, p.288-90 (14 April 1983). The authors report results of comparative noise measurements on AlGaAs semiconductor laser amplifiers of the Fabry-Perot and travelling-wave types. They show that, for the same net gain, the electrical baseband signal/noise ratio of a photodetector placed at the amplifier output (after an optical filter) is higher for a travelling-wave-type amplifier, especially at high-gain values where the Fabry-Perot amplifier is operated at oscillation threshold. For a net gain of 20.5 dB, the signal/noise ratio of the travelling-wave-type amplifier is 4-5 dB better. (12 refs.)

61149 Tuning characteristics of optical amplification in 1.5 μm InGaAsP/InP lasers. H.Kuwahara, T.Chikama, T.Nakagami (Fujitsu Labs. Ltd., Kawasaki, Japan).

Electron. Lett. (GB), vol.19, no.8, p.295-7 (14 April 1983). The bias current dependence of tuning wavelength in an optical amplifier is investigated in detail. Tuning wavelength decreases below threshold at the rate of -0.36 Å/mA, mainly due to the change of carrier density, and increases at the rate of 0.11 Å/mA above threshold due to the thermal effect. (4 refs.)

61150 Suppression of intensity fluctuation of a longitudinal mode in directly modulated GaInAsP/InP dynamic single-mode laser. F.Koyama, T.Tanbun-et, S.Arai, S.Wang, Y.Suematsu, K.Furuya (Dept. of Phys. Electronics, Tokyo, Inst. of Technol., Tokyo, Japan). *Electron. Lett. (GB)*, vol.19, no.9, p.325-7 (28 April 1983). The intensity fluctuation of a longitudinal mode in a modulated dynamic single-mode laser consisting of a 1.6 μm GaInAsP/InP buried-heterostructure laser with butt-jointed built-in distributed-Bragg-reflector (BH-BJB-DBR) was suppressed to 30 dB less than that of a conventional laser. The possibility of wideband single-mode-fibre communications in the 1.5-1.6 μm wavelength region without degradation of the bandwidth caused by mode partition noise is suggested. (10 refs.)

61151 Einstein relations for gain-guided semiconductor lasers. W.Elsaber, E.O.Gobel (Max-Planck-Inst. für Festkörperforschung, Stuttgart, Germany). *Electron. Lett. (GB)*, vol.19, no.9, p.335-6 (28 April 1983). The Einstein equations which relate the transition rates for stimulated emission, spontaneous emission and stimulated absorption in a laser active medium are re-examined for the special case of a semiconductor laser with complex wave guiding. It is shown that, owing to the nonorthogonality of the gain-guided laser modes, the Einstein relations have to be modified. In particular, the spontaneous emission rate per laser mode no longer equals the stimulated emission rate per laser photon. (8 refs.)

61152 Very low threshold GaInAsP/InP double-heterostructure lasers grown by LP MOCVD. R.Blondau, B.de Cremoux, J.P.Duchemin, M.Razeghi, S.Hersec, P.Hirtz (Thomson-CSF., Lab. Centrale Recherches, Orsay, France). *Electron. Lett. (GB)*, vol.19, no.9, p.336-7 (28 April 1983).

Room-temperature GaInAsP/InP DH lasers emitting at 1.3 μm and having very low threshold current densities have been grown by LP MOCVD. Thresholds were lower than the best values reported for comparable devices grown by LPE, the lowest threshold being 430 A/cm² for a cavity length of 950 μm (width 150 μm) with an active-layer thickness of $d=2200$ Å. (7 refs.)

61153 New mechanism for bistable operation of closely coupled twin stripe lasers. I.H.White, J.E.Carroll (Engng. Dept., Univ. of Cambridge, Cambridge, England).

Electron. Lett. (GB), vol.19, no.9, p.337-9 (28 April 1983). Evidence for a novel mechanism causing bistable operation of closely coupled GaAlAs twin stripe lasers is reported. Current switched bistable operation has been demonstrated stably at room temperature, through the light beam being switched from a central mode to one where the optical filament crosses diagonally from under one laser stripe to the other. (7 refs.)

61154 Static model of DH laser. J.Machac (Inst. of Radio Engng. & Electronics, Czechoslovak Acad. of Sci., Prague, Czechoslovakia). *IEEE Proc. I (GB)*, vol.130, no.2, p.61-6 (April 1983).

A method of complex analysis of the double-heterostructure stripe-geometry laser, based on a new static model, is presented. The optical field distribution in the active region of the laser is described by the wave equation. The interaction between the optical field and free-charge carriers is expressed by the set of rate equations describing also the carrier-concentration profile. Owing to the interaction, it is necessary to solve these equations by a self-consistent procedure. The results of the analysis are light-current characteristics, current dependences of a modal gain, spectra and a near-field pattern. These characteristics are demonstrated in an example. (19 refs.)

61155 Ultrashort pulses from semiconductor diode lasers. B.K.Garside, R.E.Park (Opto-Electronics Ltd., Oakville, Ontario, Canada). *Opt. & Laser Technol. (GB)*, vol.15, no.2, p.91-4 (April 1983).

Careful design of mounting structures and drive-circuit parameters is essential to obtain very short pulse-lengths with high peak powers from semiconductor diode lasers. The authors have developed a diode laser model using a coupled rate equation approach to predict operating regimes producing ultrashort output pulses. The model has been refined through comparison with experiment, and a 10 ps source, designed on the basis of this model, has been implemented. (5 refs.)

61156 Bistable operation of a semiconductor laser. S.A.Gurevich, E.L.Portnoi, M.E.Raikh, B.S.Rykin, F.N.Timofeev, K.Fronts (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.381-4 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.879-83 (July 1982). [received: April 1983]

The authors consider the existence of a type of bistability in a laser with a saturable absorber. In this case, both of the stable states are present in the output. To a large extent, the implementation of this idea rests upon using as the saturable absorber a semiconductor whose band gap is larger than that of the active medium. They have observed bistability in the output of GaAs-GaAlAs injection heterojunction lasers made from LOC structures in which the band gap of the material of one of the emitters, serving as the saturable absorber, is just slightly greater than the band gap of the material making up the active layer. (7 refs.)

61157 Limiting capabilities of the optimum injection-laser radiation modulation conditions. A.S.Logginov, Yu.F.Yul'berdin.

Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.4, p.56-60 (April 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.4, p.21-5 (April 1982). [received: April 1983]

Relationships are established between the value of the prepumping current, the injection-laser parameters, and the parameters of the modulating current pulses that result in the optimum pulse-code modulation mode for the radiation with maximum speed of response. (11 refs.)

61158 Vibronic solid state lasers: the transition metal ion laser. U.Durr (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany).

Laser & Optoelektron. (Germany), vol.15, no.1, p.31-9 (March 1983). In German.

Vibronic lasers are tunable powerful infrared solid state lasers based on insulating crystals doped with transition metal ions. Up to now the tuning range of pulsed systems extends between 0.7 μm -0.8 μm and 1.1 μm -2.3 μm . CW operation is possible between 1.1 μm -2.1 μm . An overview is given about the properties and recent developments of these lasers. Future possible tendencies are discussed. (18 refs.)

61159 Colour centre lasers using alkaline earth fluorides. J.Margerie (Lab. de Phys. Cristalline, Univ. Paris-sud, Orsay, France).

Rev. Cethedec (France), vol.19, no.NS82-2, p.15-31 (1982). In French.

The author's final aim is to build a tunable c.w. laser using colour centres in CaF₂:Na⁺ and SrF₂:Na⁺; for instance F_{2A}-centres with which Arkhangel'skaya et al. (1978, 1979) realised a pulsed laser. To obtain the required samples, a Bridgman crystal-growth technique was developed. The chief difficulty in achieving c.w. laser action is the bleaching of F_{2A}-centres under strong illumination. In order to circumvent it, various possible schemes are discussed, using either F_{2A} or other centres in CaF₂:Na⁺. Experimental results are described concerning the spectroscopy of colour centres in CaF₂:Na⁺, both in its static and dynamic aspects. (26 refs.)

61160 Auger recombination in GaSb and its effects on laser characteristics. I.V.Kryukova, V.I.Leskovich, E.V.Matveenko (All-Union Sci. Res. Inst. for Physicooptical Measurements, Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1285-7 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2095-7 (Oct. 1982). [received: April 1983]

It was previously discovered (see Sov. J. Quantum Electron, vol.6, p.1199, 1976) that heating to 300K seriously degrades the performance of GaSb lasers, a finding which is at variance with similar studies using closely related semiconductors such as GaAs. The present authors show that this difference is due to the high probability of radiationless Auger recombination in GaSb, which reduces the internal photon yield β . The experimental values for the interband Auger transition coefficients C_{ZZ} at 80 and 300K are in agreement with theoretical predictions according to which the probability of Auger recombination in p-type semiconductors such as GaSb and InAs is increased owing to special features of the band structure. Calculation of the temperature dependence of the threshold current density using measured values for C_{ZZ} is in satisfactory agreement with experimental data. GaSb crystals doped with tellurium (n-type) or zinc (p-type) and epitaxial p-type films with residual acceptor densities $p \approx 0.6 \cdot 10^{17} \text{ cm}^{-3}$ which were deliberately not doped were tested. Emission was stimulated by a 50-keV electron beam with pulse duration 100 ns and repetition frequency 50 Hz. (8 refs.)

61161 Laser gain and excitation threshold in semiconductors with transitions between localized states. I.V.Kryukova, S.P.Prokof'eva (All-Union Sci. Res. Inst. for Physicooptical Measurements, Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1287-9 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2097-9 (Oct. 1982). [received: April 1983]

Experiments in recent years have demonstrated that the efficiency of semiconductor lasers pumped by electron beams can be increased by using doped crystals as the active medium material [e.g. GaAs, GaSb and certain other compounds GaInAsP, CdS, in which shallow discrete acceptor levels participate in radiative recombination]. The authors propose a method for calculating gains and threshold excitations n- and p-type materials and report some calculated values. The transitions are assumed to be from the conduction band to shallow discrete acceptor levels. Values are compared with experimental data and calculations also given for undoped crystals. The quantum mechanical theory describing absorption and emission of light in straight-band semiconductors is used. It is found that the energy arrangement of the electron states is most favorable in n-type material which is heavily doped (degenerate) and contains shallow acceptor levels. The threshold density of nonequilibrium carriers is then much less than in undoped samples and the laser efficiency is maximal (~30%). On the other hand, because of the high density of equilibrium and nonequilibrium holes, particularly at 300K, absorption of emitted light by free holes is a fundamental limitation on laser efficiency when undoped or p-type crystals are used. (11 refs.)

61162 Excitation of active impurities in laser crystals under electric discharge conditions. V.M.Mikhitarian, V.R.Nikogosyan, Kh.V.Partamyan (Inst. of Phys. Res., Acad. of Sci., Erevan, Armenian SSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1350-1 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2081-2 (Oct. 1982). [received: April 1983]

A study was made of the excitation of active impurities in laser crystals by an electric discharge. The spectral kinetics of the luminescence indicated that the excitation was by direct electron impact. (5 refs.)

61163 Improvement of the characteristics of ZnSe single-crystal semiconductor lasers pumped longitudinally by an electron beam. I.V.Akimov, A.V.Dudenkova, V.I.Kozlovskii, Yu.V.Korostelin, A.S.Nasibov, P.V.Reznikov, E.M.Tishina, P.V.Shapkin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1366-8 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2099-102 (Oct. 1982). [received: April 1983]

The cathodoluminescence spectrum of ZnSe single crystals grown from the vapor and liquid phases was investigated in the range 400-800 nm and the internal quantum efficiency η was measured at $T=77\text{K}$. A correlation was found between η and the free-electron line intensity, but there was no correlation between η and other luminescence lines. A comparison of the photoluminescence spectra recorded at 4.2K for zinc selenide samples annealed in zinc and selenium with the spectra of the original samples indicated that the saturation with zinc during annealing increased η and improved the laser characteristics. 42.55T Free electron lasers

- 61164 Efficiency of free-electron lasers with a scattered electron beam.** T.J.T.Kwan, C.M.Snell (Advanced Concepts & Plasma Phys. Group, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Fluids (USA), vol.26, no.3, p.835-9 (March 1983).

The quality of the relativistic electron beam in a free-electron laser is an important factor in determining its efficiency of radiation production. In this work, the problem of beam quality is addressed by considering an electron beam that has a scattered velocity distribution but is otherwise monoenergetic. A newly developed particle-in-cell plasma simulation code is used to study the nonlinear stage of the free-electron laser; in particular, the efficiency of energy extraction is determined as a function of the amount of beam scattering. It is found that the mean scattering angle of the electron beam of a free-electron laser in the Raman regime is a much more sensitive parameter than expected. The efficiency of radiation production decreases rapidly for electron beams with finite scattering angles. (10 refs.)

- 61165 Intense free electron laser harmonic generation in a longitudinal magnetic wiggler.** R.C.Davidson (Plasma Res. Inst., Sci. Applications Inc., Boulder, CO, USA), W.A.McMullen.

Phys. Fluids (USA), vol.26, no.3, p.840-7 (March 1983).

The free electron laser instability is investigated theoretically for a tenuous relativistic electron beam propagating parallel to a longitudinal wiggler field ($B_0 + \delta B \sin k_0 z$) \hat{e}_z . The stability analysis is based on the linearized Vlasov-Maxwell equations for perturbations about the beam equilibrium $f_0 = (n_b/2\pi p_1) \delta(p_1 - \gamma_b m V)$ $\delta(p_2 - \gamma_b m V_b)$. For $(\omega_{cb}/k_0 V_b)(\delta B/B_0)$ of order unity or larger, it is found that the transverse electron orbits experience a strong temporal modulation at harmonics of $k_0 v_b \approx k_0 V_b$. In the stability analysis, this orbit modulation is manifest by radiation amplification occurring near the simultaneous zeroes of $\omega = kc$ and $\omega - k V_b - \omega_{cb} = nk_0 V_b$ for the general harmonic number n , which corresponds to an upshifted (for $n \geq 1$) wavenumber $k_n = (1 - V_b/c)^{-1}(\omega_{cb}/c + nk_0 V_b/c)$. For $(\omega_{cb}/k_0 V_b)(\delta B/B_0) > 1$, the instability is typically broadband with several harmonics excited. Moreover, depending on beam and field parameters, the characteristic maximum growth rate can be substantial with $\text{Im} \omega / c k_0 = (\sqrt{3}/2) \times \{ (V_{\perp}^2/4c^2)(\omega_{pb}^2/c^2 k_0^2) n J_n^2(\omega_{cb} \delta B / k_0 V_b B_0) \}^{1/3}$. (19 refs.)

- 61166 Multimode theory of free-electron laser oscillators.** W.B.Colson (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA), J.L.Richardson.

Phys. Rev. Lett. (USA), vol.50, no.14, p.1050-3 (4 April 1983).

The nonlinear self-consistent theory of short-pulse free-electron laser oscillators can now be extended to include transverse diffraction within the optical resonator mode. The theory provides efficient solutions to the three-dimensional parabolic-wave equation coupled to the Lorentz force equation. The method is general enough to include arbitrary magnet designs, optical mirror arrangements, and driving currents. New mode structures are predicted which should be observed in future experiments at Stanford University. (19 refs.)

- 61167 Nonlinear analysis of free-electron-laser amplifiers with axial fields.** H.P.Freund (Naval Res. Lab., Washington, DC, USA).

Phys. Rev. A (USA), vol.27, no.4, p.1977-88 (April 1983).

The nonlinear evolution of free-electron lasers in the presence of an axial guide field is investigated numerically. A set of coupled nonlinear differential equations is derived which governs the self-consistent evolution of the wave fields and particle trajectories in an amplifier configuration. The nonlinear currents which mediate the interaction are computed by means of an average over particle phases, and the inclusion of fluctuating space-charge fields in the formulation permits the investigation of both the stimulated Raman and Compton scattering regimes. The initial conditions are chosen to describe the injection of a cold, axially propagating electron beam into the interaction region which consists of a uniform axial guide field and a helical wiggler field which increases to a constant level adiabatically over a distance of ten wiggler periods. After an initial transient phase, the results show a region of exponential growth of the radiation field which is in excellent agreement with linear theory. Saturation occurs by means of particle trapping. The efficiency of the interaction has been studied for a wide range of axial guide fields, and substantial enhancements have been found relative to the zero-guide-field limit. (14 refs.)

- 61168 Nonlinear traveling-wave equilibria for free-electron-laser applications.** B.Lane, R.C.Davidson (Plasma Fusion Center, MIT, Cambridge, MA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2008-25 (April 1983).

The class of large-amplitude traveling-wave solutions to the nonlinear Vlasov-Maxwell equations is investigated in which the wave pattern is stationary in a frame of reference moving with the ponderomotive phase velocity $v_p = \omega/(k + k_0)$. Here, $\lambda_0 = 2\pi/k_0$ is the wavelength of the transverse helical wiggler field, and (ω, k) are, respectively, the frequency and wave number of the saturated radiation field which is assumed to be monochromatic and circularly polarized. The conservation of (average) density, momentum, and energy are imposed as additional exact constraint equations that connect the final (saturated) and initial states of the combined electron-beam/radiation-field/wiggler-field system. These constraint equations reduce the generality of the nonlinear equilibrium Bernstein-Greene-Kruskal solutions and allow estimates to be made of the saturated field amplitude in terms of initial properties of beam-wiggler system. As a simple example that is analytically tractable, the authors consider the case where the initial distribution $F_0(\gamma)$ and the saturated untrapped distribution $F_s(\gamma')$ are prescribed by rectangular distribution functions centered around axial velocity $v_z = \sigma/(k + k_0)$, assuming a moderate field amplitude with $b_1 = eB_1/mc^2 k < 1$ and small fractional energy spread in the beam electrons. For a tenuous beam with $\omega \approx kc$ and $k \approx (1 + v_p/c)\gamma_z^2 k_0$, where $\gamma_z = (1 - v_p^2/c^2)^{-1/2}$, it is found that the saturated amplitude of the radiation field is given approximately by $\delta B_1 = \Delta_1 \omega_p^2 / 10(1 + b_w^2)^{1/2} c^2 k_0^2 [1 + v_p/c] \bar{B}_w$, where $b_w = eB_w/mc^2 k_0$, $\Delta_1 m^2$ is the characteristic half-width energy spread in the laboratory frame, and $\omega_p^2 = 4\pi n_b e^2/m$ is the nonrelativistic plasma frequency squared. (16 refs.)

- 61169 Laser and noise-driven operation in swept-gain lasers.** F.A.Hopf (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2268-71 (April 1983).

The influence of noise on laser operation is considered for swept-gain lasers and laser amplifiers in which the velocity of the gain medium must be decreased relative to the velocity of light in order to achieve lasing action.

The noise is introduced through the tipping-angle approximation, which leads to a simple, if perhaps unrealistic, formulation of the problem. Such a laser is tuned by desynchronizing the gain medium with the optical pulse, which is the procedure used in the Stanford free-electron laser (FEL). In so doing, the FEL tunes over regions of the true lasing (gain > loss), and over regions where the output is sustained by amplified spontaneous emission (noise driven). The power in the noise-driven regime is not necessarily small compared to the power in the lasing regime. These regimes are identified, the fluctuations are computed, and the connection with the FEL is discussed. (24 refs.)

- 61170 The role of plasma turbulence for wave excitation in a free-electron-laser combined with a molecular and plasma medium.** L.Stenflo (Inst. of Phys., Umea Univ., Umea, Sweden), V.N.Tsytoich, H.Wilhelmsson.

Phys. Scr. (Sweden), vol.T2, no.2, p.538-40 (1982). [received: April 1983]

(1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The effects of plasma turbulence on the generation of radiation in a system of a free-electron-laser and a molecular and plasma medium are investigated by means of a kinetic description. The results are that low frequency waves become damped due to the presence of turbulence, whereas for sufficiently high frequencies ($\omega > \omega_{pe}$, the plasma frequency times the relativistic factor) the turbulence, also in the presence of a molecular medium ($\omega > \omega_r$, the molecular resonance frequency), may lead to amplification of the radiation. (7 refs.)

- 61171 Effects of electron energy spread on self-excitation of free-electron lasers.** L.V.Rodygin, A.V.Smorgonskii (Inst. of Appl. Phys., Acad. of Sci., Gor'kii, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1237-9 (Oct. 1982).

Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2013-17 (Oct. 1982).

[received: April 1983]

As in other electronic devices, in free-electron lasers, electrons interact most efficiently with waves when the spread in the particle parameters is small and hydrodynamic conditions exist (i.e. in laser terminology, line broadening is uniform). However, it is difficult and by no means always possible to achieve hydrodynamic conditions. It is therefore important to know the performance parameters of free-electron lasers when the particle parameters differ widely and there is a kinetic stage of interaction (nonuniform line broadening). (4 refs.)

42.60 LASER SYSTEMS AND LASER BEAM APPLICATIONS

- 61172 Stabilization of the light output delay of a pulsed nitrogen laser.** Cl.Alaimé, J.Bertrand, L.Bonnet, Y.El Masri, L.Palfy, P.Pellegrin, R.Prieels (Inst. de Phys. Corpusculaire, Louvain-la-Neuve, Belgium).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.207, no.3, p.423-7 (1 April 1983).

The authors describe a new type of phaser and demonstrate its efficiency in stabilizing the delay of the light output of a pulsed nitrogen laser with respect to the beam bursts delivered by a cyclotron. (4 refs.)

- 61173 Asymmetry in the coupling coefficients of oppositely traveling waves in a ring laser.** A.Ya.Birman, A.F.Savushkin, V.A.Solomatina.

Opt. & Spectrosc. (USA), vol.53, no.1, p.103-4 (July 1982).

Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.174-6 (July 1982). [received: April 1983]

The coupling coefficients S_a and S_b between the oppositely traveling waves obey the symmetry relation $S_a = S_b$ in scattering at the rough surface of the perfectly conducting reflector of a ring laser. This relation is valid for any realization of a random surface satisfying the condition $\sigma \ll \lambda$, where σ is the RMS height of the unevenness, λ is the wavelength of the radiation. The conclusion on the symmetry of the coupling coefficients for scattering by a perfectly conducting rough surface, however, is not accurate and is valid only on account of the approximations assumed in analyzing the coupling coefficients. The authors give the results of a more detailed analysis of the symmetry properties of the coupling coefficients for scattering at a perfectly conducting rough surface employing the Kirchhoff method. (5 refs.)

- 61174 Tunable picosecond pulses around 1.3 μ m generated by a synchronously pumped infrared dye laser.** A.Seilmeier, W.Kaiser (Phys. Dept., Tech. Univ. Munchen, Munchen, Germany), B.Sens, K.H.Drexhage.

Opt. Lett. (USA), vol.8, no.4, p.205-7 (April 1983).

An infrared dye laser is synchronously pumped by a CW mode-locked Nd:YAG system at 1.06 μ m. The tuning range extends from 1.20 to 1.32 μ m. A pulse duration of 3 psec was measured at 1.25 μ m. The high photostability of the laser dye makes the laser system a practical device. (8 refs.)

- 61175 Inexpensive low temporal jitter laser triggering circuit.** F.A.M.Leal, A.S.L.Gomes, J.R.R.Leite, C.B.de Araujo (Dept. de Fisica, Univ. Federal de Pernambuco, Recife, Brasil).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.501-2 (April 1983).

The authors present a simple and inexpensive triggering circuit which provides a laser pulse jitter of 0.5 ns. (3 refs.)

- 61176 Measurement of ultrafast phenomena in the femtosecond time domain.** C.V.Shank (Quantum Phys. & Electronics Dept., Bell Labs., Holmdel, NJ, USA).

Science (USA), vol.219, no.4588, p.1027-31 (4 March 1983).

Considerable progress has taken place in the generation and application of ultrashort optical pulses. The methods and techniques for extending time-resolved measurements into the femtosecond (10^{-15} second) time domain are described, and applications and fertile areas for investigation with femtosecond pulses are discussed. (32 refs.)

42.60B Design of specific laser systems

- 61177 GaAs/GaAlAs active-passive-interference laser.** H.K.Choi, S.Wang (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA).

Electron. Lett. (GB), vol.19, no.8, p.302-3 (14 April 1983).

A GaAs/GaAlAs interference laser with an active and a passive section is reported. A very clean single longitudinal mode is obtained and maintained without mode hopping over about 10°C, which results from the combined effect of interference and real index waveguiding in the lateral direction. (6 refs.)

- 61178 Helical-flow CO₂ laser.** M.Yessik (Photon Sources Inc., Ann Arbor, MI, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.1693-8 (April 1983).

A CO₂ laser based on a helical gas-flow design has been developed. The major features of this device are as follows: (1) an integral heat exchanger plasmabute with much lower gas flow rates than other convection-cooled lasers, (2) a multiply segmented plasmabute for high-voltage standoff (3)

coaxial beam and electric discharge with small diameter-to-length ratio resulting in high beam quality and high discharge stability, and, (4) a magnetically stabilized discharge position. Gain profile measurements show that the gain distribution highly favors low-order modes, as desired. Temperature profile measurements of the gas in the plasm tube verify the efficiency of the integral heat exchange concept. Specific laser configurations based on this design concept, intended for industrial material-processing applications, and with output powers of 400-500 W/m, are described. (11 refs.)

61179 Injection laser diodes. B.Dance.

New Electron. (GB), vol.16, no.6, p.76-8 (22 March 1983).

Discusses semiconductor laser diodes which are far smaller, more efficient and need less operating power than conventional gas and solid-state lasers. Although the mean output power from semiconductor lasers tends to be more limited than that from the other types, they have the advantage that their output can easily be modulated with signals which may have a very high frequency. Device structures and typical drive circuits are described. (no refs.)

61180 Simultaneous two-wavelength tunable dye laser with no mode competition and a wavelength separation of more than 200 nm. S.W.Williams, D.W.O.Hedde (Dept. of Phys., Royal Holloway Coll., Egham, England).

Opt. Commun. (Netherlands), vol.45, no.2, p.112-14 (15 March 1983).

A versatile simultaneous two-wavelength tunable dye laser is described. The two wavelengths are generated by means of a novel pumping arrangement which is suitable for operating with a linewidth between 0.001 nm and the broadband regime. There is no mode competition between the two wavelengths and the power ratio is continuously variable. If required, separate dyes can be used to generate the two wavelengths so facilitating a broad range of wavelength separations. Each wavelength is independently tunable but only one dispersive element is required in the cavity. (12 refs.)

61181 High power TEA CO₂ laser tuned by a holographic grating. K.P.Francke, G.Korn, H.Albrecht, S.Polze (Akad. der Wissenschaften, Zentralinst. fur Optik und Spektroskopie, Berlin, Germany).

Opt. Commun. (Netherlands), vol.45, no.2, p.115-16 (15 March 1983).

Wavelength tuning of a TEA CO₂ laser by means of a holographic grating with sinusoidal profile is reported for the first time. The grating with 136 lines/mm had an optimized efficiency according to the gain of the laser. The laser beam was coupled out through the zeroth grating order. (5 refs.)

61182 Tunable sealed-off CW CO laser at room temperature. P.J.M.Peters, W.J.Witte, Z.Krzyzanowski (Dept. of Appl. Phys., Twente Univ. of Technol., Enschede, Netherlands).

Opt. Commun. (Netherlands), vol.45, no.3, p.193-5 (1 April 1983).

Starting from a sealed-off CO laser with a long-life output of 29 W/m in multiline operation, the authors developed a tunable version of this device. The system described has a discharge length of 97 cm. It was made transition-selective by using a three-mirror configuration. In this way the authors were able to tune the laser to more than 70 oscillating vibrational-rotational transitions of the CO molecule. (4 refs.)

61183 Laser oscillator using resonator with self-pumped phase-conjugate mirror. R.A.McFarlane, D.G.Steel (Hughes Res. Labs., Malibu, CA, USA).

Opt. Lett. (USA), vol.8, no.4, p.208-10 (April 1983).

A laser oscillator has been operated in which one reflector is a self-pumped phase-conjugate mirror. The laser is tunable and employs rhodamine 6G as a broadband gain medium. The oscillating linewidth was measured to be 2 GHz at half-power points. (7 refs.)

61184 A continuous-wave laser. Z.Jankiewicz, M.Mindak, W.Pichola, J.Szydlak.

Pol. Tech. Rev. (Poland), no.5-6, p.4-5 (1982).

The LCB-6B continuous-wave laser developed and built at the Institute of Optoelectronics of the Military Technical Academy, Warsaw, generates a beam of monochromatic infrared radiation ($\lambda=1.06 \mu\text{m}$) with power of 50 W, and finds application for cutting semi-conductor structures, in scientific research and for didactic purposes. It comprises: a laser head assembly, a power supply circuit and a cooling system. The active material of this laser is a YAG:Na³⁺ crystal measuring 5 mm diameter \times 80 mm. Its faces are coated with antireflection layers. The laser rod made of the active material and an exciting linear krypton tube are placed at the two foci of an elliptical reflector. The reflecting surfaces of the reflector (side and face surfaces) are gold-coated. (no refs.)

61185 YAG 50B pulsed laser. Z.Jankiewicz, W.Pichola, M.Skorczakowski, J.Szydlak.

Pol. Tech. Rev. (Poland), no.5-6, p.6-7 (1982).

The laser head incorporates a YAG:Na³⁺ rod diameter 3 mm \times 55 mm, a gas discharge lamp 3F 2K, in an elliptical reflector and two front reflectors. (no refs.)

61186 A low-power He-Ne laser head. M.Gebczak, J.Tuszynski.

Pol. Tech. Rev. (Poland), no.5-6, p.8 (1982).

Describes the series of LM-type He-Ne laser heads, LM-200, LM-300, LM-500, designed for use in laser geodetic instruments developed at the Institute of Optoelectronics of the Military Technical Academy, Warsaw. The LM-type He-Ne laser heads feature good mechanical, thermal and power stability characteristics. The concentric discharge tube is closed by Brewster windows which ensures linear polarization of the laser beam. An aluminium cold cathode is used. The laser heads incorporate a hemispherical resonator, ensuring the TM_{00q} mode operation. (no refs.)

61187 High-power-density electron-beam-sustained laser. M.Casey, P.W.Smith, M.H.R.Hutchinson (Blackett Lab., Imperial Coll., London, England).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.458-62 (April 1983).

A high optical power-density excimer laser pumped by an electron-beam-sustained discharge has been developed. The electron-beam generator comprised a 200-kV pulse transformer-driven power supply and an electrostatically focused electron-beam diode. The careful design and optimization of this generator has allowed very reliable, reproducible operation of the complete laser system with a high enhancement ratio of 4.8. An average output power density of 0.63 MW cm⁻² in a 250-nm (FWHM) pulse has been obtained from an e-beam-sustained discharge XeCl* laser with an extraction efficiency of 1.5%. (7 refs.)

61188 Effect of outgassing on the performance of a TE CO₂ laser sealed in an acrylic chamber. D.J.Biswas, A.K.Nath, U.K.Chatterjee (Laser Section, Bhabha Atomic Res. Centre, Bombay, India).

Rev. Sci. Instrum. (USA), vol.54, no.4, p.473-5 (April 1983).

Outgassing of contamination in large quantity was observed in a helical TE CO₂ laser housed in an acrylic (Perspex) chamber. This considerably reduced the sealed operational life of the device. In a helium-free mixture the laser energy initially improved and then reduced with time, while in the mixtures with helium it reduced monotonically. Water vapor seemed to be the main constituent in the contamination. By circulating the contaminated gas through

a trap at dry-ice temperature, the water vapor was condensed, enhancing the sealed-off life of the device. (10 refs.)

61189 Solid-state laser having a reflector that transmits IR and UV radiation. I.F.Balashov, B.G.Berezin, B.P.Kryzhanovskii, M.I.Polyakov, S.I.Khanikov, G.A.Nikitina.

Sov. J. Opt. Technol. (USA), vol.49, no.8, p.500-1 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.28-9 (Aug. 1982). [received: April 1983]

The possibility of short-term stabilization of the energy parameters of a laser, cooled by natural radiant heat removal through the use of a reflector having a selective coating that transmits IR and UV radiation, is investigated. (5 refs.)

61190 Operating characteristics of a transverse-excited 16 μm CO₂ laser with profile electrodes and UV-preionization. K.-J.Schmatjko, H.-J.Cirkel (Kraftwerk Union AG, Erlangen, Germany).

Siemens Forsch. & Entwicklungsber. (Germany), vol.12, no.2, p.135-9 (1983).

The maximum attainable inversion density for the 16 μm laser transition of a direct-discharge CO₂ laser is limited by fast collisional deactivation processes. The optical volume can, however, be extended significantly by a transverse homogeneous volume discharge. Effective UV preionization and a well-damped fast discharge circuit are essential to this purpose. Electrical energy density for optimized excitation is limited only by the allowable heating of the laser gas under these conditions. (24 refs.)

61191 Electric-discharge CW industrial CO₂ laser. V.P.Garashchuk, P.A.Vasilets, V.I.Kirsej, I.A.Porazhinskii, A.A.Svirgun (E.O. Paton Inst. of Electric Welding, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1316-20 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2028-35 (Oct. 1982). [received: April 1983]

An experimental CO₂ laser is described, having an output power of 1.5 kW. The use of an electric-discharge unit containing a plane anode and nickel rod cathodes made it possible to couple 150 W into the active medium per cathode (input energy per unit mass 200 J/g, input power per unit volume 5.5 W/cm³, maximum electrooptic efficiency 24%). The service life of the cathodes exceeded 400 h. The relative stability of the output power, without recourse to stabilization, was 2-3% for continuous operation (without switching off) over a period of 8 h. The laser could be operated for 8 h without replenishing the active mixture and a helium-free CO₂-N₂-H₂O mixture could be used. (24 refs.)

61192 High-pressure NH₃-N₂ laser. M.Akhrarov, B.I.Vasil'ev, A.Z.Gras-yuk, A.B.Yastrebov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1326-9 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2044-9 (Oct. 1982). [received: April 1983]

A pulsed high-pressure-(up to 3 atm) NH₃-N₂ laser is described, having an output power of 10 kW at a frequency of 868 cm⁻¹ and optically pumped by radiation from a TEA CO₂ laser. It was established that when the parameters of the NH₃-N₂ laser resonator and the pump intensity were fixed one could achieve an increase in the operating pressure of the active medium on using a depleted NH₃-N₂ mixture having an increased partial pressure of ammonia. (10 refs.)

61193 Distributed-feedback heterojunction laser fabricated by interference laser annealing. Zh.I.Alferov, K.G.Kalandarishvili, Yu.V.Koval'chuk, E.L.Portnoi, V.B.Smirtinskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.333-4 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.769-72 (July 1982). [received: April 1983]

Reports the experimental fabrication of distributed-feedback heterojunction lasers by an interference laser annealing of epitaxial films of InGaAsP/InP heterostructures. The gap width of the quaternary compound was chosen smaller than the photon energy corresponding to the fundamental frequency of a neodymium laser ($\lambda=1.06 \mu\text{m}$): $E_g=1.08 \text{ eV}$. (4 refs.)

61194 Photodissociation CW laser using condensation and evaporation for a closed cycle. V.O.Zaleskii, A.M.Kokushkin, S.S.Polikarpov.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.393-5 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.907-11 (Aug. 1982). [received: April 1983]

In an effort to overcome difficulties associated with the output power and duration of operation of the I laser, the authors used a condensation-evaporation apparatus, consisting of two communicating vessels, to move and purify the gas. As the working gas leaves the laser tube it is liquefied in one of the vessels (the condenser); the liquid passes through a column containing an adsorbent (activated charcoal) and enters the other vessel (the evaporator). The evaporating medium enters the laser tube. The pressure head required to overcome the drag of the transport system is balanced by a difference between the levels of the liquid phase in the communicating vessels. (4 refs.)

61195 Aperture combined Raman laser. C.Woods, K.Tang, C.Hownton, D.Muller, R.O.Hunter, Jr. (Western Res. Corp., San Diego, CA, USA).

Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.TuB6/1-3

Discusses the use of an injection-locked KrF laser to excite a Raman laser using the Stokes shift in hydrogen gas with off-axis pumping. (4 refs.)

61196 Influence of a nonlinear active medium on the structure of natural oscillation modes of a Fabry-Perot interferometer. A.V. Butkovskii. *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1286-9 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.1977-83 (Oct. 1982). [received: April 1983]

The results are given of a parametric calculation of the mode structure of a circular Fabry-Perot resonator of a solid-state laser. It is shown that an increase in the equivalent Fresnel number of the resonator (when its value is sufficiently large) alters the mode field distribution in some cases so that it resembles the modes of increasing order occupying the main part of the resonator, whereas in other cases the mode field is concentrated in a decreasing region near the resonator axis. The existence of several different solutions for the same mode is demonstrated. In the case of resonators with an equivalent Fresnel number much greater than unity the distributions of the intensity are close to geometric in the main volume of the resonator and estimates are given of the angular divergence of the output radiation. (10 refs.)

61197 CW operation of an injection ring laser. A.P. Bogatov, P.G. Eliseev, O.G. Okhotnikov, G.T. Pak, M.P. Rakhval'skii, K.A. Khairetdinov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.346-7 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.799-803 (July 1982). [received: April 1983]

The authors have, for the first time, demonstrated CW single frequency operation of an AlGaAs heterojunction semiconductor laser with a ring resonator. The arrangement proposed makes it possible to minimise the coupling between the oppositely charged waves. At a light density of 2.10^5 W/cm², one observes an approximate travelling wave operation. 61198 A miniature modulator. W. Aleksinski, K. Rozanski. *Pol. Tech. Rev. (Poland)*, no.5-6, p.9-10 (1982).

Discusses the MMP-2 laser beam modulator for the generation of high power, short pulses 10 to 50 ns, achieved by the Q-switching of the laser resonator. The MMP2-modulator can be used for Q-switching of ruby lasers and neodymium lasers, and for modulating laser light beam. This modulator consists of two assemblies: a pockels cell, and a power supply and control circuit. A KDP crystal is used as active material in the Pockels cell. (no refs.)

61199 Generation of femtosecond intense optical pulses and applications to time resolved spectroscopy. A. Antonetti, R. Astier (Lab. d'Optique Appliquee, ENSTA, Ecole Polytech., Palaiseau, France), D. Hulin, J.L. Martin, A. Migus, A. Orszag.

Rev. Cethedec (France), vol.19, no.NS82-2, p.155-74 (1982). In French. New techniques have been developed for producing GW peak power optical pulses, in the femtosecond regime with a new capability of wavelength tunability. Such an experimental advance has made possible the theoretical understanding of some ultrafast phenomena in solid-state physics or in biology: (1) formation of a superdense electron-hole plasma in CuCl, whose emission corresponds to a band gap renormalisation effect; (2) existence of a very short lived excited state (250-300 fs) in the photodissociation of CO or O₂ hemoprotein; (3) explanation of the low quantum yield of dissociation of MbO₂ by relaxation of excited states and geminate recombination. (22 refs.)

61200 Continuous-wave YAG:Nd³⁺ laser with mode locking and intracavity frequency doubling. Yu.D. Golyaev, S.A. Grodskii, V.G. Dmitriev, P.G. Konvisar, S.V. Lantratov, V.Yu. Mikhailov, S.R. Rustamov. *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1360-2 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2093-5 (Oct. 1982). [received: April 1983]

An investigation was made of acoustooptic mode locking in a YAG:Nd³⁺ laser with intracavity frequency doubling in a lithium iodate crystal. The energy, noise, and 'mismatch' characteristics of the laser were investigated. It was found that the mode locking zone increase in size to several millimeters, compared with the regime in the absence of frequency doubling. The maximum power of the second harmonic observed in the mode-locked regime was 5 W, which was approximately three times higher than in the pure CW regime. (9 refs.)

61201 Use of passive switches in the generation of a train of nanosecond pulses by a neodymium glass laser. V.A. Rusov, A.I. Stepanov, A.A. Tarasov. *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1371-3 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2106-8 (Oct. 1982). [received: April 1983]

A train of nanosecond pulses was generated by a neodymium glass laser when a passive laser switch based on a LiF crystal with F_2 color centers was used to control the Q factor. The total radiation energy in a train reached 100 J, the number of pulses in a train exceeded 50, and the instability of the power and repetition frequency of the pulses was within 20-30%. It was found

that, when used in the selected operating regime, switches of this kind were superior to passive switches composed of organic dye solutions. (7 refs.)

61202 Temperature control of an acousto-optic modulator in an Argon ion laser using an R.F. servo loop. J.G. Edwards, D. Henderson. *Report NPL-DES-78*, Nat. Phys. Lab., Teddington, England (Feb. 1983), 20 pp.

A servo system is described to control the temperature of the modulator prism for a mode locked argon ion laser. The loop uses the phase of the reflected RF power to sense the temperature of the glass prism and controls this temperature via the RF, hence maintaining resonance and allowing full use of the available RF power. A second loop using a thermistor and DC heaters defends the first against room temperature fluctuations.

61203 Total radiant power measurement of laser diode by a calorimetric method. T. Inoue, K. Yamamura (Electrotech. Lab., Ibaraki, Japan). *Electron. Lett. (GB)*, vol.19, no.9, p.320-1 (28 April 1983).

A calorimetric measurement method for the absolute value of total radiant power from a laser diode is described. The radiant power is measured from the difference between input DC power to the laser diode and its heat loss by a calorimeter. The method is also useful for an ordinary semiconductor light source. (1 ref.)

61204 Influence of linear phase anisotropy induced in the active medium on the characteristics of gas-laser radiation. A.P. Voitevich, V.S. Kalinov, A.Ya. Smirnov, L.L. Teplyashin. *J. Appl. Spectrosc. (USA)*, vol.36, no.5, p.489-93 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.717-22 (May 1982). [received: Feb. 1983]

The possibility of using the linear phase anisotropy induced in the active medium of a laser to control the spectrum of the generated laser radiation is known. Experimentally, considerable constriction to the center of the amplification contour of the generation spectrum has been obtained in a helium-neon laser with a radiation wavelength of 0.63 μ , inducing anisotropy by means of a transverse magnetic field. However, the potential for the use of linear phase anisotropy to control the spectrum of the generated radiation is not exhausted by constriction of the generation region. It is of interest to obtain frequency retuning of the generation region and to study the possibility of transverse-mode discrimination. The authors examine the influence of phase anisotropy and the transverse magnetic field in general on the generation power, with different mutual orientations of the magnetic field strength and the principal directions of the polarizer. (6 refs.)

61205 Stabilizing a gas discharge laser with an external absorption cell under modulated operation. A.V. Mironov, V.E. Privalov.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.494-8 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.722-7 (May 1982). [received: Feb. 1983]

Considers some properties of the operation of stabilized lasers with linear and ring cavities utilizing gain modulation. It is assumed that the automatic frequency tuning system has sufficient gain in the feedback circuit that the frequency instability in the laser emission is determined by the error signal. (8 refs.)

61206 Pulse evolution and mode selection characteristics in a TEA-CO₂ laser perturbed by injection of external radiation. P.H. Flamant, R.T. Menzies, M.J. Kavaya, U.P. Oppenheim (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

Opt. Commun. (Netherlands), vol.45, no.2, p.105-11 (15 March 1983).

A grating-tunable TEA-CO₂ laser with an unstable resonator cavity, modified to allow injection of CW CO₂ laser radiation at the resonant transition line by means of an intracavity NaCl window, has been used to study the coupling requirements for generation of single frequency pulses. The width and shape of the mode selection region, and the dependence of the gain-switched spike buildup time and the pulse shapes on the intensity and detuning frequency of the injected radiation are reported. Comparisons of the experimental results with previously reported mode selection behavior are discussed. (10 refs.)

61207 Laser heating: an analytical approach to the theory. D.J. Gibbons (Central Res. Labs., Thorn EMI plc, Hayes, England).

Opt. & Laser Technol. (GB), vol.15, no.2, p.95-9 (April 1983).

The theory of pulsed and scanned laser beams is developed and the results are shown to agree with similar analyses by other authors. A new expression, however, for the temperature rise caused by a very small laser spot agrees well with recent experiments. (9 refs.)

61208 Multiple beams from Rogowski-profile solid electrode TEA CO₂ lasers. S.A. Hamadto (Dept. of Phys., King Saud Univ., Riyadh, Saudi Arabia).

Opt. & Laser Technol. (GB), vol.15, no.2, p.105-7 (April 1983).

Three and five beams were observed to emerge with angular symmetry from Rogowski-profile solid electrode TEA CO₂ lasers. A simple geometrical optics theory of the external reflection guided-modes within the rectangular cavity formed by the laser mirrors and electrodes has successfully accounted for the number and angular separation of these multiple beams, and has established criteria for their elimination. (5 refs.)

61209 Laser-power fluctuations: an analog signal-correction technique. D. Kumar, R.V. Nauman, R. Mohanty, S.P. McGlynn (Dept. of Chem., Louisiana State Univ., Baton Rouge, LA, USA), G.L. Findley. *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.463-8 (April 1983).

A simple and inexpensive analog technique which corrects spectroscopic signals for pulse-to-pulse fluctuations in the output power of an excitation laser is described. The technique is applicable to both linear and nonlinear spectroscopy and, in the latter case, requires no fast electronic function generator. This design yields an improved time-constant characteristic which parallels the approach of the effective time constant toward RC. Furthermore, since this improvement does not require any preintegration, pulse shape information is preserved. A description of a photoacoustic (PA) spectrometer which incorporates the signal-correction device and which relies on the photogalvanic effect for wavelength calibration is presented as an example. Finally, signal-

corrected PA spectra of the $S_1 \leftarrow S_0$ transition in azulene are presented. (20 refs.)

61210 Performance of a laser beam wave-front sensor. C.P.Wang (Aero-phys. Lab., Aerospace Corp., Los Angeles, CA, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.469-72 (April 1983). Laser beam wave-front measurement is important for laser beam quality evaluation and beam control. In this paper the author reports on a laser beam wave-front sensor consisting of a phase detector and a scanner. With the use of this sensor, the wave-front phase profile across a hydrogen fluoride (HF) laser beam has been obtained. The major advantages of this technique are that it is fast, sensitive, and compact. Other features are electric scanning, self-alignment, noise cancellation, and no drift. Wave-front sensor operational principles, features, and experimental results are presented. The sensitivity of the sensor was 5° . This sensitivity corresponds to the change of beam quality parameter, the Strehl ratio, by 1%. Hence it is a sensitive beam quality measurement technique. (14 refs.)

61211 Problem of accurate intensity measurements in focused laser beams. Yu.K.Daniileiko, T.P.Lebedev, V.N.Nikolaev, A.V.Sidorin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1295-7 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.1992-7 (Oct. 1982). [received: April 1983] The problem of intensity measurements in sharply focused Gaussian laser beams is discussed. It is shown that existing methods have many disadvantages, particularly for small caustics. A new method is proposed for measuring the aberrations of focusing lens systems and determining the maximum intensity in a caustic. (3 refs.)

61212 Frequency reproducibility of ring He-He/CH₄ lasers. M.V.Daniileiko, A.M.Fal', V.P.Fedin, M.T.Shpak, L.P.Yatsenko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1307-16 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2013-27 (Oct. 1982). [received: April 1983] An investigation was made of the factors governing the frequency reproducibility of ring gas lasers stabilized using resonances of nonlinear absorption in methane. The laser was of monolithic construction convenient in many practical applications. Frequency stabilization by competitive and phase resonances of nonlinear absorption ensured a frequency reproducibility of 5×10^{-13} and 4×10^{-12} , respectively, and this reproducibility was governed mainly by the inaccuracy of the establishment of the necessary pressure in the amplifying medium. A theory of nonlinear resonances in ring gas lasers was developed for an arbitrary degree of saturation of the absorption and this theory could be compared directly with the experimental results. (26 refs.)

61213 Resonances of the polarization of gas laser radiation under mode self-locking conditions. G.I.Kozin, I.P.Kononov, V.N.Petrovskii, E.D.Prosenko, A.N.Rurukin (Engng. Phys. Inst., Moscow, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1321-6 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2035-44 (Oct. 1982). [received: April 1983] A theoretical analysis is made of a gas laser with an internal absorption cell operating in the regime of self-locking of two orthogonally polarized modes with a finite spatial shift along the resonator axis. It is shown that the radiation emitted by such a laser exhibits polarization resonances. Potential applications of these resonances in ultrahigh-sensitivity spectroscopy are considered. (9 refs.)

61214 Use of high-frequency laser-intensity fluctuations for optical measurements. A.B.Bukhman, E.M.Dianov, A.Ya.Karasik, V.A.Kozlov, A.M.Prokhorov, A.K.Senatorov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.389-90 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.897-900 (Aug. 1982). [received: April 1983] Proposes the exploitation for optical measurements of laser intensity fluctuations in the frequency range from tens of kilohertz to hundreds of megahertz. The intensity fluctuations are similar to a white noise and correlate with the laser output intensity, so that useful information about an optical signal can be extracted from the level of this noise. The authors selected three types of CW lasers: an LG-52-1 commercial He-Ne laser operating in a single transverse mode ($\lambda = 0.63 \mu\text{m}$), an injection semiconductor laser ($\lambda = 0.85 \mu\text{m}$), and a neodymium garnet laser ($\lambda = 1.064 \mu\text{m}$). The solid-state lasers operated in several transverse modes. (6 refs.)

61215 Thermo-optic-conversion method for detecting the spatial mode structure of a TEA CO₂ laser beam. E.A.Chernov (Lenin Komsomol State Univ., Voronezh, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.429-30 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.992-5 (Aug. 1982). [received: April 1983] Proposes a simple and convenient method, usable in any laser laboratory, which makes use of a thermo-optic converter, which has been used previously to measure the spatial structure of the beams from CW CO₂ lasers. The converter is a thin film of CdS deposited in vacuum on a piece of Muskovite television mica $60 \times 60 \text{ mm}^2$ in size. (9 refs.)

61216 Beam-profile measurement of laser pulses using a spatial filter to sample the hermite modes for a string of pulses. E.G.Johnson, Jr.. Report NBS-TN-1057, Nat. Bur. Stand., Washington, DC, USA (Sept. 1982), iii+39 pp. As a first step in the development of a beam-profile measuring instrument for laser sources that is capable of determining the distribution of low-order (less than 25) Hermitean modes in a series of laser pulses, the author has designed and evaluated the three key parts of such an instrument. First, there is the telescope system which allows the incident laser beam to be phase, beam-width, and beam center matched to the optical spatial filter. Second, there is a brief error analysis of the structure of the mismatch function between the beam out of the telescope and that expected by the filter. Finally, there is the detailed analysis and design of the computer-generated spatial filter that will cause the incident-laser beam to be cross correlated with the low-order Hermite modes and will create an array of light spots in the detector (Fourier transform) plane each of which can be uniquely related to a particular Hermite mode of the original laser pulse. The principal conclusion is that the Hermite mode analysis can be done with better than 99 percent separation between modes, provided the phase between modes is uncorrelated from pulse to pulse when the filter has been fabricated with a two-level, gray-scale structure which samples the profile with either 0 percent, or 100 percent transmission. (8 refs.)

61217 Anti-Stokes Raman scattering of excimer and tunable UV lasers in chemically pumped CO. J.C.White (Bell Telephone Labs., Holmdel, NJ, USA), T.A.Miller, M.Heaven. Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.TuB5/1-3

Presents experiments in which chemically pumped CO has been studied as a storage medium for anti Stokes Raman lasers (ASRL) operating in the VUV. Excited CO is particularly attractive as a medium for ASRL action due to the ease with which it can be prepared, the large energy shift (e.g. 3-4 eV), and the position and strength of the various electronic transitions. Initial experiments aimed at constructing an ASRL tunable from 140 nm to 170 nm with mJ output energy have been conducted, and the authors report spectroscopic studies in which excimer and tunable laser sources have been used to pump the CO inversion in a small scale device. Although ASRL action is yet to be achieved, these studies indicate that such a device is indeed feasible as an excimer laser up-converter. (3 refs.)

61218 Laser alignment techniques. D.C.Williams (NPL, Teddington, England). *Phys. Technol. (GB)*, vol.14, no.2, p.61-7 (March 1983).

Describes the relevant properties of a laser beam and the techniques and instruments which are available for alignment work. Amongst the techniques discussed are three-point systems and various commercial levelling systems. The effect of ambient air and accessories used in laser alignment work, particularly the pentagonal prism, are dealt with. (9 refs.)

61219 A study of laser Doppler anemometer based on colliding beams. V.M.Zemlyanskii, N.P.Divnich, A.M.Demeschik. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.357-61 (March 1983). In Russian.

A laser Doppler anemometer based on colliding beams is analyzed using the vector theory of light scattering. Doppler signal calculation results are presented for conditions of scattering by spheres of polystyrene (dia=1.5 μm) and water (dia=1.98 μm) for various states of illuminating beam polarization. 61220 Investigation of the rotation of a wave front in a molecular multipass amplifier. N.E.Aver'yanov, Yu.A.Baloshin, A.I.Dernyatn, I.V.Pavlishin. *J. Appl. Spectrosc. (USA)*, vol.36, no.5, p.502-4 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.730-3 (May 1982). [received: Feb. 1983]

Presents the results of a numerical computer investigation into the phenomenon of rotation of a wave front (RWF) with four-photon mixing (FPM) in the medium of a nonlinear (with partial saturation) molecular multipass TEA-amplifier based on CO₂. The authors investigated RWF with FPM in an amplifier with $\tau_p \leq 10^{-7}$ sec. (5 refs.)

61221 Optical bistability in multimode systems with second- and third-order dispersive nonlinearity. F.-J.Schutte, K.Germey, R.Tiebel, K.Worlitzer (Pädagogische Hochschule 'Karl Liebknecht', Potsdam, Germany). *Opt. Acta (GB)*, vol.30, no.4, p.465-74 (April 1983).

Mutual optical bistability is found for several modes in open cavities containing second- or third-order nonlinear materials. The quantum-statistical treatment yields the Fokker-Planck equation for any system of damped boson modes. Under certain conditions it is possible to state the extrema of the steady solution of the Fokker-Planck equation. They are compared with the steady states resulting from the classical deterministic treatment. In some cases both statements coincide. (12 refs.)

61222 Excitation of surface polaritons by nondegenerate four-wave mixing of evanescent waves. S.T.Hendow, K.Ujihara (Dept. of Phys. & Astron., Univ. of New Mexico, Albuquerque, NM, USA). *Opt. Commun. (Netherlands)*, vol.45, no.2, p.138-42 (15 March 1983). Proposes a method for exciting a surface polariton wave by nonlinear mixing of three evanescent waves. The nonlinear polarization and phase matching conditions are analysed for diatomic cubic crystals and a numerical example is given for GaP showing that this scheme is possible. Furthermore, by consideration of the energy balance in the crystal, the gain coefficient for the surface wave and the intensity of the wave coupled to the vacuum are also calculated. (18 refs.)

61223 Difference-frequency as a tunable source for detection of free radicals. P.-V.Nickles, T.Lungershausen, G.Fritsch (Akad. der Wissenschaften, Zentralinst. fuer Optik & Spektroskopie, Berlin, Germany). *Exp. Tech. Phys. (Germany)*, vol.31, no.1, p.65-73 (1983). In German. The radiation of a dye-laser and the SHG of a YAG-laser are frequency-mixed in LiIO₃ as the nonlinear crystal. The so formed difference-radiation is tunable in the IR-region 2.8...5.6 μ m with pulsepower of some watts. This system is suitable for linear absorption measurements. The system parameters are discussed for the detection of free CH₃-radicals in the IR-region. (11 refs.)

61224 Spectroscopic and line-narrowing properties of resonant sum and difference frequency generation. B.Dick, R.M.Hochstrasser (Dept. of Chem., Univ. of Pennsylvania, Philadelphia, PA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3398-409 (15 March 1983). Three wave mixing is investigated with respect to its spectroscopic applications under fully resonant conditions. A theoretical study of the appropriate second order susceptibility $\chi^{(2)}$ reveals interesting features both for sum and difference frequency generation. For difference frequency generation two different mechanisms are possible, one of which allows the observation of resonances between excited states and the study of dephasing induced coherent emission. The coherence decay rate between the two excited states may be measured and also its pure dephasing rate. The line-narrowing characteristics of the fully resonant $\chi^{(2)}$ are studied with respect to correlation between the inhomogeneous distribution for different levels. The line-narrowing capabilities are found to be partly complementary for the sum- and the two difference frequency resonance configurations. This leads to the suggestion of new line-narrowing techniques which could provide information about type and amount of correlation in inhomogeneously broadened systems. (35 refs.)

61225 Nonlinear optical phenomena in a multiple interferometer. V.N.Lugovoi (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.473-8 (April 1983). A multiple interferometer is proposed and stimulated Raman radiation, stimulated Mandel'stam-Brillouin radiation, and Cerenkov-type optical parametric oscillation are considered in this interferometer, which is excited by an external light beam. An extremely low threshold intensity of the exciting beam is noted. Optical bistability and hysteresis, self-pulsing of the radiation intensities, amplification of amplitude-phase deviations in the incident pumping beam, limitation of the intensity of the beam transmitted by the interferometer, and nonlinear reflection of the beam from the multiple interferometer are predicted and discussed. It is also noted that the threshold for generation of the second Stokes component of stimulated Raman radiation and stimulated Mandel'stam-Brillouin radiation under the conditions discussed is usually not achieved, even for high excess of the exciting beam intensity over the threshold for generation of the first Stokes component. (25 refs.)

61226 Nonlinear interferometry in Langmuir-Blodgett multilayers of polydiacetylene. F.Kajzar, J.Messier (CEA-CENS, Gif-sur-Yvette, France), J.Zyss, I.Ledoux. *Opt. Commun. (Netherlands)*, vol.45, no.2, p.133-7 (15 March 1983). A new technique of nonlinear spectroscopy in highly absorbing media is demonstrated for polydiacetylenes. Third harmonic of a Nd:YAG laser is generated and measured by interference between two Langmuir-Blodgett multilayers of polymer. The intensity recorded after two 2700 Å thick multilayers is comparable to that obtained from a CaCO₃ 1.91 mm thick phase matched crystal. (13 refs.)

61227 Shift of stimulated Brillouin scattering component in certain liquid mixtures. N.F.Andreev. *Opt. & Spectrosc. (USSR)*, vol.53, no.1, p.4-5 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.7-9 (July 1982). [received: April 1983] It is shown that during stimulated Brillouin scattering the frequency shift of the stimulated Brillouin scattering component is again a nonmonotonic function of the solution concentration. Consequently, there may be significantly expanded opportunities for tuning the frequency of high-power laser beams in optical experiments. For the present experiments binary mixtures of organic liquids: ethanol (C₂H₅OH) and carbon tetrachloride (CCl₄); acetone (C₃H₆O) and carbon tetrachloride; benzene (C₆H₆) and carbon tetrachloride; and acetone and benzene were used. The nonmonotonic dependence of the shift of the stimulated Brillouin component (or of the hypersonic frequency) on the solution concentration may be evidence of the presence of complexes and associations in the solution, and it may yield information on the composition and structure of these formations. (8 refs.)

61228 Observation of resonantly enhanced sum-frequency generation involving sodium Rydberg states. D.J.Gauthier, J.Krasinski, R.W.Boyd (Inst. of Optics, Univ. of Rochester, Rochester, NY, USA). *Opt. Lett. (USA)*, vol.8, no.4, p.211-13 (April 1983). A large, DC-electric-field-induced nonlinear optical susceptibility is exploited to produce ultraviolet radiation in the range 2453-2476 Å by the process of sum-frequency generation in sodium. The interaction is resonantly enhanced at the first intermediate level by the ³P_{3/2} state and at the second intermediate level by a Rydberg state. Conversion efficiencies of 10⁻³ have been obtained; improvement of this value by a factor of 10³ should be possible. (10 refs.)

61229 Generation of 35.5-nm coherent radiation. J.Bokor (Bell Labs., Holmdel, NJ, USA), P.H.Bucksbaum, R.R.Freeman. *Opt. Lett. (USA)*, vol.8, no.4, p.217-19 (April 1983). Tunable coherent radiation was produced at 35.5 nm by seventh-harmonic conversion of 248-nm radiation from a krypton fluoride excimer laser. The nonlinear interaction took place at the intersection of the laser focus and a pulsed, supersonic helium gas jet. Third- and fifth-harmonic generation produced coherent outputs at 83 and 50 nm in both helium and xenon gas jets. (15 refs.)

61230 Effect of laser fluctuations on squeezed states in a degenerate parametric amplifier. K.Wodkiewicz, M.S.Zubairy (Max-Planck-Inst. fur Quantenoptik, Garching, München, Germany). *Phys. Rev. A (USA)*, vol.27, no.4, p.2003-7 (April 1983). The effect of phase and amplitude fluctuations of the pump mode on the quantum-statistical properties of the signal mode is considered. It is shown that these fluctuations in the laser field tend to decrease the squeezing of the signal field. (15 refs.)

61231 Self-compensating optical frequency conversion. R.B.Weisman (Dept. of Chem., Rice Univ., Houston, TX, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.502-3 (April 1983). A novel optical configuration is described for use with angle-tuned nonlinear frequency conversion crystals. By double passing the beams through the crystal, the new method suppresses wavelength-dependent beam displacements more thoroughly and conveniently than previous approaches. This configuration is useful in automatic phase-matching systems and experiments requiring overlapped beams. (5 refs.)

61232 Present prospects for continuous coherent ultraviolet sources. B.Couillaud, A.Ducasse (Centre de Phys. Moléculaire Optique et Hertzienne, Univ. de Bordeaux-I, Talence, France). *Rev. Cethedex (France)*, vol.19, no.NS82-2, p.33-55 (1982). In French. Presents a brief and incomplete review of the progress that has been made in the generation of highly monochromatic ultraviolet radiation, as well as a review of the different experiments that have been performed in this frequency domain. The methods of frequency doubling or mixing using nonlinear crystals located inside the laser cavity or inside an external enhancement cavity are compared and the results that have been obtained are given. Finally a new method that the authors have recently proposed, in which the crystal is located inside an injected CW laser, is described. Preliminary results are included. (30 refs.)

61233 Stimulated scattering of electromagnetic waves by a magnetized relativistic beam of oscillators. S.N.Belov, N.I.Karbushev, A.A.Rukhadze (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1068-72 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1741-7 (Sept. 1982). [received: April 1983]

A theory is derived for the stimulated scattering of electromagnetic waves by a relativistic beam of oscillators. A general dispersion relation is derived and analyzed in detail for the case with cyclotron resonances. The enhancement of the scattered radiation and the starting currents for stimulated Raman and Compton scattering are derived for spatially bounded systems. The efficiency of the stimulated scattering of electromagnetic radiation under cyclotron-resonance conditions is derived from the condition for electron trapping in the field of the scattered wave and for complete modulation of the beam of oscillators. (11 refs.)

61234 Polarization four-photon spectroscopy within the absorption line: role of coherent Rayleigh scattering and of the multilevel nature of molecules. N.I.Koroteev, M.F.Ternovskaya (M.F. Lomonosov State Univ., Moscow, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1281-6 (Oct. 1982). Translation of: *Kvantovaya Elektron. Moskva (USSR)*, vol.9, no.10, p.1967-77 (Oct. 1982). [received: April 1983]

It is shown that in order to obtain a correct interpretation of experiments on four-photon nonlinear spectroscopy within the absorption line, it is necessary to allow not only for a coherent four-photon process due to a resonant electronic nonlinearity but also for a similar process involving generation of optically induced diffraction gratings followed by the diffraction of one of the probe beams from these gratings. It is also necessary to allow for the contribution of highly excited molecular states to the resonant electronic nonlinearity. General expressions are derived and investigated for the cubic susceptibility in an isotropic medium. It is found that all nonzero components of this tensor may be expressed in terms of a single scalar function of the interacting wave frequencies. The explicit form of this function is determined in the lowest order of perturbation theory. (23 refs.)

61235 Efficient parametric sum-frequency generation by noncoherent two-photon pumping of metal vapors. A.V.Aleksandrov, S.A.Pleshanov, V.S.Solomatina (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1337-9 (Oct. 1982). Translation of: *Kvantovaya Elektron. Moskva (USSR)*, vol.9, no.10, p.2060-5 (Oct. 1982). [received: April 1983]

Four-photon parametric sum-frequency generation in a randomly modulated (noncoherent) pump field was investigated, and an expression obtained for the quantum conversion efficiency. It was found experimentally that on broadening the pump line by a factor of 20-30 (lowering the spectral density by a factor of 10-20) the quantum conversion efficiency for 9.27 μ radiation in sodium vapor reached 35%, exceeding that for the case of quasimonochromatic pumping. (14 refs.)

61236 Interaction in frequency doubling of ultrashort laser pulses. L.S.Telegin, A.S.Chirkin (M.V. Lomonosov State Univ., Acad. of Sci., Moscow, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1354-6 (Oct. 1982). Translation of: *Kvantovaya Elektron. Moskva (USSR)*, vol.9, no.10, p.2086-8 (Oct. 1982). [received: April 1983]

A study of the multiplication of the frequency of picosecond pulses revealed a shift of the central frequency of the second harmonic spectrum dependent on the intensity of the fundamental-frequency radiation. It was found that the effect was associated with the cubic nonlinearity of the medium. A theory of

second harmonic generation was developed in the constant intensity approximation allowing for the quadratic and cubic nonlinearities. (11 refs.)

61237 Stimulated Raman scattering in optical fibers. Y.Ohmori, Y.Sasaki, T.Edahiro (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan), vol.E66, no.2, p.146-52 (Feb. 1983).

Stimulated Raman scattering is investigated in optical fibers, pumped by a mode-locked and Q-switched Nd:YAG laser or a CW Nd:YAG laser. The critical powers for the first five Stokes, at which each Stokes begins to build up, decreased with an increase in the length of fiber and became constant values above 200 meter long in the case of a mode-locked and Q-switched pump. The first and the second Stokes were observed with 0.6 W and 2.1 W of CW pump power input, respectively, in a 35 km single-span fiber. Experiments showed that the pulse wave separation effect played an important role in stimulated Raman scattering characteristics of optical fibers. (13 refs.)

42.65F Phase conjugation

61238 Efficient phase conjugation by Brillouin enhanced four wave mixing. A.M.Scott (Royal Signals & Radar Estab., Great Malvern, England).

Opt. Commun. (Netherlands), vol.45, no.2, p.127-32 (15 March 1983). It is shown that frequency detuning and phase mismatch effects can strongly affect the reflection coefficient of Brillouin enhanced four-wave mixing. Extremely large reflectivities ($R > 10^6$) can be obtained if the intensities and frequency of the pump beams and the length of the interaction region all take on certain critical values. This theory accounts for the high reflectivity which has been reported by another author. (7 refs.)

61239 Four wave mixing due to the optical Kerr effect and Rayleigh-wing scattering. A.M.Scott (Royal Signals & Radar Estab., Malvern, England).

Opt. Commun. (Netherlands), vol.45, no.3, p.207-11 (1 April 1983). The nearly degenerate four-wave mixing process is considered when the interaction arises through the Kerr nonlinearity and Rayleigh-wing scattering. It is found that the reflection coefficient depends on the product of the pump field strengths, and that it progressively becomes smaller as the signal beam is detuned from the pump beam. This is in contrast with the electrostrictive case (i.e. the Brillouin type of interaction) where the reflectivity may become large at certain frequency detunings, and may depend on the ratio of the two pump fields, and the phase mismatch. (9 refs.)

61240 Phase conjugation with phenomenological pump depletion. N.C.Kothari, M.Yoshizawa, T.Kobayashi (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

Opt. Commun. (Netherlands), vol.45, no.3, p.211-14 (1 April 1983). The authors introduce phenomenological depletion terms of the pump beams in the phase conjugate coupled equations of Yariv and Pepper (see Optics Lett., vol.1, p.16, 1977), and obtain the modified expressions for conjugate reflectivity and probe transmissivity. The results are compared with the experiments of Bloom et al. and it is shown that under their experimental conditions the authors' theoretical expressions give reasonably good matching. (12 refs.)

61241 Improvement of phase-conjugate beam fidelity in degenerate four-wave mixing by focused probe fields. E.Bochove (Telecommunicacoes Brasileiras S/A, Campinas, Sao Paulo, Brazil).

Opt. Lett. (USA), vol.8, no.4, p.202-4 (April 1983). It is shown that signal-beam fidelity in degenerate four-wave mixing, which is affected by the finite beam widths of the pump beams, may be largely restored over a wide range of spatial frequencies. The technique consists of focusing the probe beam into the mixing cell. This permits restoration of up to about 90% of the principal distortion effect. (6 refs.)

61242 Forced Rayleigh scattering: thermal and acoustic effects in phase-conjugate wave-front generation. R.C.Desai, M.D.Levenson, J.A.Barker (IBM Res. Labs., San Jose, CA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.1968-76 (April 1983). The authors present and discuss a theory for hydrodynamic effects in forced-Rayleigh-scattering experiments. The efficiency of phase-conjugate wave-front generation by forced Rayleigh scattering varies significantly with the nature of the solvent and the scattering angle. Acoustic effects become important for small scattering angles and times shorter than 0.5 ns under which conditions the simple thermal-diffusion theory fails. The phase-conjugate reflection efficiency predicted by the authors' theory at short times

is much smaller than that predicted by the thermal-diffusion theory, and thus need not obscure other quantum electronic processes. (18 refs.)

61243 Four-wave interaction of low-power CO₂ laser radiation in SF₆. N.K.Berger, I.A.Deryugin, V.V.Novokhatskii (Polytech. Inst., Khabarovsk, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1359-60 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2091-2 (Oct. 1982). [received: April 1983]

A four-wave interaction of CO₂ laser radiation was studied. The pump wave power was 3-5 W and the signal wave power was 0.5-0.8 W. The nonlinear medium was gaseous SF₆. The pressure dependence of the reflection coefficient was determined (a maximum was of the order of 0.1%). The influence of heating of SF₆ by CO₂ laser radiation was considered. (7 refs.)

61244 Effect of the laser breakdown of a glass stimulated-Brillouin-scattering mirror on its phase-conjugation properties. P.I.Bal'kyavichyus, A.S.Dement'ev, I.P.Lukoshyus, E.K.Malutis, V.P.Tarulis (Inst. of Phys., Acad. of Sci., Vilnius, Lithuanian SSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.353-4 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.816-19 (July 1982). [received: April 1983]

Most experimental studies of phase conjugation (or 'wavefront inversion') during stimulated Brillouin scattering use lightguides filled with liquids (usually carbon disulfide) or compressed gases. For several applications, however, there is interest in the phase conjugation which occurs in the stimulated Brillouin scattering of focused beams in solid media, of which the most important for laser systems are optical glasses. Because of the high threshold intensities for stimulated Brillouin scattering of focused beams, the phase conjugation is frequently accompanied by simultaneous self-focusing and laser breakdown of the medium. It is thus important to study the efficiency and quality of the phase conjugation under various focusing conditions and at various pump intensities, close to the threshold intensities for the breakdown of solids. In the present experiments the authors studied the effect of damage in K-8 glass and in KSG quartz glass on the efficiency of subsequent stimulated Brillouin scattering and phase conjugation. They used the second harmonic ($\lambda = 0.53 \mu\text{m}$) of a neodymium-glass laser. (10 refs.)

61245 Optical multiple pulse sequences for multiphoton selective excitation and enhancement of forbidden transitions. W.S.Warren (Dept. of Chem., Princeton Univ., Princeton, NJ, USA), A.H.Zewail.

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3583-92 (15 March 1983).

In this paper the authors present novel and simple pulse sequences for enhancing the intensity of forbidden or highly nonresonant optical transitions. These sequences provide a straightforward approach to circumventing the most serious limitation of optical coherent transient spectroscopy. Available laser intensities are often insufficient to excite a significant fraction of the ground state population into desired excited states, either because of large inhomogeneous broadening or, in the case of multiphoton absorption, large anharmonicities. Optical phase modulation (which can be produced by an acousto-optic modulator) or amplitude modulation (which can be produced by an interferometer) with carefully chosen pulse flip angles and delays can effectively remove even very large energy mismatches, thus permitting essentially complete population inversions arbitrarily far from resonance. Coherent averaging theory and computer calculations are used to derive particularly valuable sequences. Pumping enhancement of 10^3 - 10^5 (depending on individual molecular parameters) for these modulated pulse sequences are predicted. Specific applications to multiphoton pumping of local vibrational modes are discussed. (30 refs.)

61246 Narrow optical hole burning and related effects in ruby. T.Endo, T.Muramoto, T.Hashi (Dept. of Phys., Kyoto Univ., Kyoto, Japan).

Opt. Commun. (Netherlands), vol.45, no.2, p.122-6 (15 March 1983).

The authors observed a narrow optical hole burning in ruby whose width (FWHM = 107 kHz) is the narrowest of those reported so far in solids. The steady state, 'transient hole' was used as the basis for theoretical analysis of the hole burning, and the first observation of optical wiggles and the detection of superhyperfine structures near zero frequency are reported as two new effects related to the narrow optical hole burning. 61247 Thermal defocusing and transformation of the statistics of a spatially noncoherent light beam. V.A.Aleshkevich, S.S.Lebedev, A.N.Matveev (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1340-2 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2066-70 (Oct. 1982). [received: April 1983]

The Monte Carlo method is used to consider the problem of thermal self-interaction of a multimode light beam. A study is made of the transformation of the statistics of the distributions of the intensity and phase of the radiation, and also of the behavior of the average width and of the spatial coherence radius. It is shown that at distances of the order of the nonlinear thermal self-interaction length of coherent radiation a multimode beam splits into filaments and this results in deterioration of its spatial coherent and in a considerable change in the statistics of the radiation. 42.78 OPTICAL LENS AND MIRROR SYSTEMS

(for microscopes, see 07.60P; for photographic instruments, see 07.68; for astronomical telescopes, see 95.55)

- 61252 Effect of conicoid asphericity on the Tscherning ellipses of ophthalmic spectacle lenses. G.Smith, D.A.Aitchison (Dept. of Optometry, Univ. of Melbourne, Parkville, Victoria, Australia). *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.441-5 (April 1983).
 One of the criteria in ophthalmic spectacle lens design is the elimination of oblique astigmatism. For a range of equivalent powers, Seidel (primary or third-order) astigmatism can be eliminated, and the solutions of back- (or front-) surface power are commonly displayed graphically in the form of ellipses (Tscherning ellipses). The Tscherning ellipses apply only to lenses constructed from spherical surfaces. If one or both surfaces are made aspheric, the solutions for zero astigmatism are no longer in the form of ellipses. If one surface, usually the front surface, is made as a conicoid aspheric, the solutions for zero astigmatism can be presented graphically similarly to the Tscherning ellipses. For any given equivalent power, there are two or no solutions for spherical lenses. However, there is always one and up to three solutions for conicoid aspheric lenses. (12 refs.)
 61253 Luneburg lens: unitary invariance and point characteristic. H.A.Buchdahl (Dept. of Theoretical Phys., Faculty of Sci., Australian Nat. Univ., Canberra, Australia). *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.490-4 (April 1983).
 The Hamiltonian of the Luneburg lens K is invariant not merely under rotations but under a wider group of unitary transformations. This has two immediate consequences: First, by inspection one can write down ray integrals sufficient in number to describe fully the shapes and deposition of rays; second, K is one of the rare, nontrivial systems for which the point characteristic can be exhibited in closed, nonparametric form. This paper sets out in detail what has just been described in outline. (9 refs.)
 61254 Second-stage concentrators—a new formalism. E.M.Kritchman (Dept. of Phys., Univ. of Chicago, Chicago, IL, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.508-11 (April 1983).
 The concept of second-stage nonimaging concentrators is redefined. A model of an incoherent source of limited emitting angle serves to simulate the input rays to these elements. Hence the second stages may be classified as a sub-

group of ideal concentrators that collect all the radiation emitted by such sources and concentrate it up to the maximum achievable limit. As a consequence of this discussion, it becomes obvious that, for any given plane behind a primary, an ideal second stage can be designed with its entrance aperture located on that plane. Implications for the design of ideal reflectors with shielding windows are discussed. (18 refs.)

- 61255 Rectangular Luneburg-type lenses for integrated optics. E.Van Wood, J.R.Busch (Columbus Labs., Battelle Memorial Inst., Columbus, OH, USA), D.T.Moore, C.B.Wooley, W.H.Southwell. *Opt. Lett. (USA)*, vol.8, no.4, p.226-8 (April 1983).
 Compact Luneburg-type lenses of rectangular outline as viewed from above have been made by thermal evaporation of As_2S_3 glass onto single-mode $LiNbO_3:Ti$ waveguides through suitably shaped masks and subsequent exposure of the glass to ultraviolet light. The best lenses had speeds of $f/5.5$ at an aperture of 10 mm and focal spots at reduced aperture about 1.2 times the diffraction-limited size. These lenses have a field of view of at least 25° inside the waveguide. (5 refs.)
 61256 General principles for compiling computer archives of optical systems to be used as reference designs. I.M.Mal'tsev. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.431-3 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.28-30 (July 1982). [received: April 1983]
 A general approach to the development of a computer archive of optical systems to be used as reference designs, which is included in a dialog system based on the BESM-6 computer, is described. The classification of the archive optical systems in terms of their functional purpose and special attributes is presented as a special case of possible classifications. An example of the interaction procedure between optical designer and computer archive is discussed. (4 refs.)

42.78H Coatings

- 61257 Metallic multilayers: new possibilities in X-UV optics. P.Dhez (LURE, Univ. Paris Sud, Orsay, France). *Adv. Space Res. (GB)*, vol.2, no.4, p.199-206 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).
 Reflectivities measured on metallic multilayers obtained by evaporation methods have demonstrated the validity of theoretical predictions. Experimental tests using wavelengths from 1.54 Å to several hundred of angstroms give a firm basis for proposed new designs for X-UV optics. This new kind of Bragg reflector can be tailored for any wavelength and any incidence angle, because the period of evaporation of the layered synthetic medium can be freely chosen. Such artificial Bragg reflectors are more efficient than natural, organic or molecular crystals which have been employed until now in the X-UV, and can overcome the weak luminosity and astigmatism problems encountered in grazing incidence optics. The possibility of evaporating multilayers on shaped substrates will lead to optics with focusing and selectivity functions given by a single reflection. (29 refs.)

- 61258 A tunable 90° rotator using a total reflection by a monodomain cholesteric liquid crystal cell. H.Takezoe, Y.Ouchi, M.Hara, A.Fukuda, E.Kuze (Dept. of Textile & Polymeric Materials, Tokyo Inst. of Technol., Tokyo, Japan). *Jpn. J. Appl. Phys. Part 2 (Japan)*, vol.22, no.3, p.L185-7 (March 1983).
 A tunable 90° rotator using a cholesteric liquid crystal cell is presented. The idea is based on a unique optical feature of cholesterics, a total reflection. In the total reflection region, linearly polarised incident light is totally reflected and the incident polarisation is rotated by about 70° . In other words, 80% of the incident light intensity can be converted to the perpendicular component to the incident polarisation over a relatively wide spectral range, 485 nm-670 nm. The cell of another tuning range is also easily obtained by choosing the helical pitch of cholesterics. (4 refs.)
 61259 Analysis of effect of fabrication errors of a scanning four-component prism on the ray paths in it. Yu.A.Gogolev, I.I.Druz'. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.428-30 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.26-8 (July 1982). [received: April 1983]
 The allowable fabrication errors of a scanning four-component prism are analyzed. Special selection of the right-angle prisms, comprising the four-component prism, is proposed in order to broaden the tolerances on its fabrication. (4 refs.)

- 61260 Increased-accuracy triaxial autocollimator.** I.A.Konyakin, E.D.Pankov.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.514-15 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.41-3 (Aug. 1982). [received: April 1983]
The operating principle and metrological capabilities of triaxial autocollimator, built on the basis of the AK-0.25 instrument, are examined. (5 refs.)
- 61261 Illuminator for IAB-451 schlieren instrument to implement the four-slit color method.** T.N.Besmenova, V.Ya.Bruckman, V.B.Dmitrieva, V.A.Novikov, V.A.Yakovlev.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.531-2 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.59-60 (Aug. 1982). [received: April 1983]
An attachment to the IAB-451 schlieren instrument has been developed in which one light source and lightguides are used to illuminate the four slits of the illuminator diaphragm. (2 refs.)

- 61262 Recent developments in ultraviolet filters and coatings.** B.K.Flnt (Acton Res. Corp., Acton, MA, USA).
Adv. Space Res. (GB), vol.2, no.4, p.135-42 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).
A number of new high efficiency optical coatings have recently been developed at wavelengths in the ultraviolet and vacuum ultraviolet for use in space science experiments. The development of these coatings has resulted in the design and manufacture of wavelength selective filters used in reflectance at near normal incidence that have high VUV reflectance with little near-UV and visible reflectance. Material limitations, more severe than those in the visible, place certain restrictions on the size, wavelength, and degree of selectivity that is achievable with present technology. A summary of the current commercial technology along with the material limitations is presented. (6 refs.)

42.80D Monochromators

- 61263 Simplified method for calculating the parameters of a symmetric monochromator with a concave holographic diffraction grating.** I.V.Peiskhson, N.G.Romanova, N.Yu.Chernyak.
Opt. & Spectrosc. (USA), vol.53, no.2, p.219-20 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.369-73 (Aug. 1982). [received: April 1983]
A method is proposed that can be used to calculate the parameters of the optical scheme of a symmetric monochromator with a concave spherical holographic grating and the recording conditions that ensure minimal defocusing when scanning the spectrum, with a simultaneous correction of astigmatism and coma for the mean wavelength of the operating range. The calculations involved in this method do not require complicated calculations and can be carried out with the help of desk-type minicomputers (a DZ-28 type, for example). (3 refs.)

42.80F Gratings, echelles

- 61264 Secondary structures formed during the inscribing of diffractive three-dimensional phase gratings.** V.B.Konstantinov, Yu.F.Romanov, A.F.Rykhlov, A.Yu.Tropechenko (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1134-6 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1849-53 (Sept. 1982). [received: April 1983]
The secondary structures which arise during the holographic inscribing of three-dimensional phase gratings are examined. These structures result from the reflection of light from the boundaries of the photographic plate. Their relation to the secondary diffracted waves observed during reconstruction is discussed. It is found that the experimental ratio of the diffraction efficiencies of the secondary structures agrees with the theoretical predictions. (5 refs.)

42.80L Optical waveguides

(for fibre optical waveguides, see 42.80M)

- 61267 Nonlinear effects in TIPE-LiNbO₃ waveguides for optical communications.** M.De Micheli (Univ. de Nice, Nice, France).
J. Opt. Commun. (Germany), vol.4, no.1, p.25-31 (March 1983).
A new fabrication process of waveguides in LiNbO₃, Titanium Indiffusion Proton Exchange (TIPE) is reported, and the waveguides are characterized. Their nonlinear possibilities are studied and compared to existing systems, and some prospective applications are given. (12 refs.)
- 61268 Loss reduction in curved dielectric optical slab waveguide.** M.Geshire, S.Sawa (Dept. Electronics Engng., Ehime Univ., Ehime, Japan).
Electron. Lett. (GB), vol.19, no.9, p.321-3 (28 April 1983).
Formulas of the pure bending loss and the transition loss valid for TM modes in dielectric optical slab waveguides are presented. The characteristic of the total transmission loss of a step-index slab waveguide containing a circular bend having an asymmetric waveguide structure are analysed numerically by applying derived loss formulas. It is found that the features of the total transmission loss of TM modes are closely analogous to those of TE modes except for small discrepancies in the numerical values. (3 refs.)
- 61269 Waveguide loss evaluation by the ray-optics method.** M.Miyagi, S.Kawakami (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).
J. Opt. Soc. Am. (USA), vol.73, no.4, p.486-9 (April 1983).
Attenuation constants of bound or leaky modes in a general class of straight planar waveguides evaluated by the ray-optics method are analytically shown to be identical in the first-order of approximation with those obtained from the characteristic equation when one takes the Goos-Hanchen shift into account. It is also pointed out that significant errors will result if the Goos-Hanchen shift is ignored. (6 refs.)
- 61270 Optical mode conversions in Nd substituted iron garnet films.** N.Koshizuka, T.Okuda, Y.Yokoyama, K.Ando (Electrotech. Lab., Ibaraki, Japan).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.167-9 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
Magneto-optical TE-TM mode conversion was studied in LPE grown (YNd)₃Fe₅O₁₂ films as functions of growth temperature and film thickness. High conversion efficiency (~80%) was found for the film in the in-plane field higher than 3 Oe. The phase matching was explained by the small stress induced birefringence (1×10⁻³). (8 refs.)

61271 Single-mode anisotropic cylindrical dielectric waveguides. R.F.Alvarez-Estrada, M.L.Calvo (Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain).

Opt. Acta (GB), vol.30, no.4, p.481-503 (April 1983).

The authors study anisotropic cylindrical dielectric waveguides under the following conditions: (1) their cross section Ω has arbitrary shape; (2) the dielectric permittivity tensor ϵ has discontinuities at the boundaries, as well as a graded spatial variation; (3) Ω is small, and ϵ minus the unit 3×3 matrix (I) is small and smooth, so that only one pair of propagation modes is allowed. A general and exact dispersion relation for the propagation modes is derived, using integral equation techniques and the long wavelength singularity of the free-space Green's function in two dimensions. The authors present approximate explicit solutions of the dispersion relation to first order in $(\epsilon-I)$, which exhibit a logarithmic dependence and birefringence in general. Some numerical estimates are also given. Approximate dispersion relations up to and including second order in $(\epsilon-I)$ are also discussed. The scattering problem is treated briefly. (17 refs.)

61272 Mode coupling in a specifically tapered Bragg grating coupler. M.Hofman, J.Nezval (Inst. of Radio Engng. & Electronics, Czechoslovak Acad. of Sci., Praha, Czechoslovakia).

Opt. Commun. (Netherlands), vol.45, no.3, p.143-4 (1 April 1983).

Analytic expressions of the coupling process between a guided surface wave and a backward travelling diffraction order are derived by means of coupled wave theory for specifically tapered Bragg grating couplers. Numerical results are presented for a linear taper. (7 refs.)

61273 Gaussian approximation of the waveguide EH_{11} mode pattern in the far field. P.Belland, J.P.Crenn (Dept. de Recherches sur la Fusion Controlee, CEN, Fontenay-aux-Roses, France).

Opt. Commun. (Netherlands), vol.45, no.3, p.165-70 (1 April 1983).

The calculation of the far-field intensity pattern of the EH_{11} mode launched from a hollow dielectric circular waveguide is carried out as a particular case of the Gaussian beam diffraction by a circular aperture. The result derived by using a Gaussian approximation agrees very well with that computed from Fresnel diffraction theory and with experimental values obtained from the study of the beam launched from EH_{11} single mode waveguide lasers. (22 refs.)

61274 Coupling of optical fibres: a simple but precise technique.

Rev. Polytech. (Switzerland), no.12, p.1603 (Dec. 1982). In French. Describes a plug-and-socket method of joining optical fibres developed by Philips. The connection is thus simply made and with minimum loss. The connector is manufactured using a small optically-controlled turret concentric to the core of the fibre. (no refs.) L.A.F.

61275 Extending the working temperature range of high-aperture light guides. I.V.Aleksandrov, S.Ya.Fel'd, O.E.Shushpanov (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1140-3 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1859-64 (Sept. 1982). [received: April 1983]

It is shown on the basis of existing experimental data that the increase in the refractive index of the light-reflecting cladding of a light guide of the glass-polymer type upon cooling is due to an increase in the density of the polymer. The range of working temperatures of the light guide can be widened by introducing an additional outside covering to decrease the change in the density of the light-reflecting polymer cladding by restricting its deformation. The deformation of the light-reflecting cladding can be effectively limited if its thickness is properly chosen. Approximate formulas are given for designing such a light guide for a specified range of working temperatures. The validity of these formulas is checked by comparison with the results of exact calculations. The results of a numerical experiment are presented, which show that by choosing the design in accordance with these formulas, one can achieve the specified working range even when a relatively soft polymer is used for the outer coating, and even at small thicknesses. The requirements on the construction of a light guide having the minimum diameter for a given range of working temperatures are formulated. Such an optimization permits the diameter of the light guide to be substantially decreased, resulting in increased flexibility and service life. (9 refs.)

61276 Extraction of radiation from a planar optical waveguide by diffraction in noncollinear mode interaction with the lattice. S.S.Dremov, V.E.Strigalev, Yu.P.Udoev (Kalinin Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1170-2 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1902-4 (Sept. 1982). [received: April 1983]

Measurements were made for waveguide layers and additionally for a $Ti:LiNbO_3$ diffusion waveguide. Corrugation was produced by ion etching with a URM-3-279-036 apparatus through photoresist masks previously prepared on the waveguide by holographic means with a diffraction method of checking the etching depth of the photoresist directly during chemical etching of the exposed layer. The results indicate that the corrugation method has a marked effect on the characteristics of a noncollinear integrated-optics communication element. The data can be used in rough estimates of the necessary corrugation depth and interaction length in developing such communication elements for waveguide structured close to those examined. (3 refs.)

61277 Time-dependent theory of resonant tunnel coupling in optical waveguides. V.V.Malov, D.A.Pavlovskii, L.V.Iogansen (All-Union Correspondence Inst. for Textile & Consumer Industry, Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1182-4 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1922-6 (Oct. 1982). [received: April 1983]

The time-dependent theory of coupled waves is considered. Conditions are found under which the nonstationary wave-coupling theory must be used and the equations are solved explicitly for the case of two coupled waves. The time evolution of a rectangular input pulse is examined in detail. (8 refs.)

61278 Optical waveguides from epitaxial lithium niobate films. A.P.Vorono, M.B.Kosmyrna, A.P.Ostroumenko, V.P.Prudkii, E.F.Chaikovskii, A.V.Shmalko.

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.349-50 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.806-10 (July 1982). [received: April 1983]

Reports a study of planar optical waveguides made from epitaxial lithium niobate single-crystal films grown by liquid-phase epitaxy from a $Li_2O-Nb_2O_5-V_2O_5$ molten solution on lithium tantalate substrates. The waveguides have an essentially uniform index distribution. (12 refs.)

61279 Thin-film Ge-As₂S₃ waveguide with diffraction input coupling of a CO₂ laser beam. M.A.Vasil'eva, L.E.Vorobn'ev, S.N.Danilov, V.I.Stafeev, D.A.Firsov.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.438-9 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.1014-17 (Aug. 1982). [received: April 1983]

Reports a study of the waveguide properties of the modulators and the efficiency at which the beam from a CO₂ laser can be coupled in for a particular Ge-As₂S₃ structure. This structure may serve as the starting point for the development of a thin-film IR modulator made from p-Ge or from n-InSb, which has similar optical properties, but it is necessary to adhere strictly to the optimum conditions in order to maximize the efficiency. This may be achieved by coupling the light in and out through the substrate: $p_m/(p_m + p_m) = 1$. In this case an efficiency of the order of 50% can be achieved. A second approach to increasing the efficiency might be to metalize the waveguide under the gratings. It might also be possible to arrange single-mode input, which would increase η . (6 refs.)

61280 Production of 'Gradan'-type lightguide blanks on automated equipment (model UIZS-1). V.V.Grigor'yants, M.E.Zhabotinskii, G.A.Ivanov, V.N.Isakov, N.A.Koreneva, A.G.Novikov, V.V.Petyukevich, V.V.Storozhev.

Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.3, p.123-6 (March 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.3, p.70-5 (March 1982). [received: April 1983]

Automated equipment is described for fabricating lightguide blanks by the chemical vapor-phase precipitation method. The parameters of the fiber lightguides, obtained from the blanks, are given. (8 refs.)

61281 Large-aperture lightguides with a hard outside coating. I.V.Aleksandrov, S.Ya.Fel'd, O.E.Shushpanov.

Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.3, p.126-31 (March 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.3, p.75-80 (March 1982). [received: April 1983]

The glass-polymer type of lightguide with a hard external coating applied to the cladding is examined. It is shown that this approach can increase significantly the numerical aperture and range of operating temperatures of the lightguide. (11 refs.)

61282 The effect of the quartz support tubes on the amount of light attenuation in fiber lightguides. V.V.Grigor'yants, A.V.Zigunskeya, G.A.Ivanov, N.A.Koreneva, Yu.K.Chamorovskii, V.V.Shemet.

Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.4, p.60-4 (April 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.4, p.25-30 (April 1982). [received: April 1983]

The effect of the quartz support tubes on the amount of light attenuation in multimode fiber lightguides is investigated. It is shown that this effect is caused by contamination of the light-conducting layers with impurities contained in the support tube and by imperfections in the fiber lightguides associated with defects of the quartz support tube. (14 refs.)

61283 Designing optical fibers for frequency conversion and optical amplification by stimulated Raman scattering and phase-matched four-photon mixing. C.Lin (Bell Labs., Holmdel, NJ, USA).

J. Opt. Commun. (Germany), vol.4, no.1, p.2-9 (March 1983).

Discusses fiber design considerations for frequency conversion and optical amplification applications in the visible and the near infrared. Both the material parameters (Raman spectra, absorption spectra, refractive-index dispersion, etc.), and the fiber parameters (transmission loss, core diameter, dispersion properties, etc.) need to be considered for efficient conversion by stimulated Raman scattering and phase-matched stimulated four-photon mixing. The use of birefringence and schemes of group velocity matching are also discussed. (28 refs.)

61284 Stimulated Brillouin scattering in a monomode optical fiber. D.Cotter (British Telecom Res. Labs., Ipswich, England).

J. Opt. Commun. (Germany), vol.4, no.1, p.10-19 (March 1983).

Stimulated Brillouin scattering (SBS) has recently been observed in low-loss monomode fibers at power levels of only a few milliwatts. This article reviews the increasingly important influence which SBS will have on the design and operating range of future optical communications systems which employ low-loss fiber and narrowband laser transmitters. The important dependence of the SBS gain and threshold on the spectrum and modulation parameters of the optical transmitter is described. Possible techniques for suppressing SBS in optical communications systems are discussed. (38 refs.)

61285 Optical fibres: a solution looking for a problem? S.Hannington.

Electr. Times (GB), no.4693, p.8, 9, 11 (11 March 1983). Looks at the development of optical fibres during the past six years. The initial prophecy of a 'great industrial future' was followed by a market slump. However, a new range of equipment from several manufacturers has revitalised interest in optical fibre products. Available equipment is reviewed. (no refs.)

61286 Spontaneous Brillouin noise in long-distance high-bandwidth optical-fibre transmission. J.Stone, A.R.Chraplyvy (Crawford Hill Lab., Bell Labs., Holmdel, NJ, USA).

Electron. Lett. (GB), vol.19, no.8, p.275-7 (14 April 1983).

The light propagating in a single-mode optical fibre is found to be converted gradually into forward-scattered spontaneous Rayleigh-Brillouin power. The Brillouin component has a linewidth of ~500 MHz and constitutes ~1/200 of the propagating power at 1.3 μ m wavelength after 600 km. The measured backscatter-Brillouin shift coefficient is ~0.15 GHz/wt.% GeO₂. (10 refs.)

61287 Single-mode-fibre cutoff measurements using offset splice technique: excess loss effects. J.E.Chapman, D.Wu (Valtec, A. Philips-M/A-COM Venture, West Boylston, MA, USA).

Electron. Lett. (GB), vol.19, no.8, p.290-1 (14 April 1983).

The effect of excess loss mechanisms on the measurement of the LP₁₁ mode cutoff wavelength using the offset splice technique is investigated. The authors show that the measured cutoff wavelength will shift towards shorter wavelengths only if excess attenuation is present in both the emitting and receiving fibres. The shift is not observed if the excess loss is only present in one of the two fibres. (6 refs.)

- 61288 Characterisation of single-mode fibres by near-field measurement.** G. Coppa, P. Di Vita, U. Rossi (CSEL, Torino, Italy). *Electron. Lett. (GB)*, vol.19, no.8, p.293-4 (14 April 1983). A new technique for the determination of the refractive-index profile of single-mode optical fibres from a simple near-field measurement is proposed. This permits one to deduce accurately all the important parameters of the fibre. (6 refs.)
- 61289 Derivation of fundamental-mode electric field and modal properties of single-mode fibres from variable-aperture launch method.** F. Alard, P. Sansonetti (CNET LAB/MER/FOG, Lannion, France). *Electron. Lett. (GB)*, vol.19, no.9, p.313-14 (28 April 1983). Reports a simple derivation of the electric field and modal properties of the fundamental mode of single-mode optical fibres only from the results of the variable-aperture launch method performed on the fibre. (6 refs.)
- 61290 Segmented-core single-mode fibres with low loss and low dispersion.** V.A. Bhagavatula, M.S. Spatz, W.F. Love, D.B. Keck (Corning Glass Works, Res. & Dev. Div., Corning, NY, USA). *Electron. Lett. (GB)*, vol.19, no.9, p.317-18 (28 April 1983). Single-mode-fibre designs with segmented core for achieving simultaneously low loss and dispersion are described. Results showing dispersion flattening of ± 1.5 ps/km nm over a 280 nm range are presented. Such dispersion flattening is achieved while maintaining spot sizes of 4-5 μ m, which compare favourably with those for earlier designs without dispersion flattening. (11 refs.)
- 61291 Simple power spectrum of microbendings in single-mode fibres.** P. Danielson (Electromagnetics Inst., Tech. Univ. of Denmark, Lyngby, Denmark). *Electron. Lett. (GB)*, vol.19, no.9, p.318-20 (28 April 1983). A simple model is set up yielding the power spectrum of the microbendings in single-mode optical fibres. The model rests on an assumption of random short curvatures of the fibre axis. Employing the effective spot size instead of the RMS spot size the author achieved good agreement with experimental data. (4 refs.)
- 61292 Radiation from graded-index single-mode fibres.** C.D. Hussey (School of Electronic Engng., Nat. Inst. for Higher Education, Dublin, Ireland). *IEE Proc. H (GB)*, vol.130, no.3, p.225-9 (April 1983). Radiation from the fundamental mode due to sources in graded-index single-mode optical fibres can be examined by determining the effect of the presence of the perturbing core on the free-space (i.e. uniform cladding) radiation field. The author looks at this effect for fibres with power-law-profile cores. Using these examples he discusses the following two approximation schemes: (i) a new equivalent step approximation where the step has the same 'degree of guidance' as the graded core, and (ii) a previously proposed WKB asymptotic approximation. (9 refs.)
- 61293 Inverse-square wavelength dependence of attenuation in infrared polycrystalline fibers.** J.A. Harrington (Hughes Res. Labs., Malibu, CA, USA), M. Sparks. *Opt. Lett. (USA)*, vol.8, no.4, p.223-5 (April 1983). The total-attenuation coefficient α_T in polycrystalline thallium bromiodide fibers varies as λ^{-2} , in sharp contrast to the Rayleigh λ^{-4} dependence in silica fibers. The authors developed a model showing that this λ^{-2} attenuation results from the combination of bulk scattering from large-scale, optically thin imperfections and surface scattering and absorption. The model also explains the authors' scattering sphere result that the attenuation coefficient that is due to scattering, α_s , at 10.6 μ m increases linearly with fiber length, in contrast to the situation in glass fibers in which α_s is constant along the fiber. (8 refs.)
- 61294 Laser phase noise effects in fiber-optic signal processors with recirculating loops.** M. Tur, B. Moslehi (Stanford Univ., Stanford, CA, USA). *Opt. Lett. (USA)*, vol.8, no.4, p.229-32 (April 1983). The power spectrum of the optical intensity at the output of a single-mode-fiber recirculating delay line driven by a multimode semiconductor laser is shown to exhibit a spectral structure with notches at zero frequency as well as at other multiples of 1/(loop delay). A theoretical model based on laser phase noise is suggested to explain the experimental data. (10 refs.)
- 61295 Real-time Fourier transformation in dispersive optical fibers.** T. Jansson (Res. Div., Nat. Tech. Systems Inc., Los Angeles, CA, USA). *Opt. Lett. (USA)*, vol.8, no.4, p.232-4 (April 1983). The general concept of temporal Fourier transformation in dispersive media is analyzed. The real-time optical Fourier transformer is shown to be realizable by using dispersive single-mode fibers and chirping lasers. (15 refs.)
- 61296 Beam-oscillation suppressor for multimode gradient-index fibers.** W.K. Kahn, Shuwen Yang (Dept. of Electrical Engng., George Washington Univ., Washington, DC, USA). *Opt. Lett. (USA)*, vol.8, no.4, p.238-40 (April 1983). The oscillations about the fiber axis that generally accompany a beam injected eccentrically into a gradient-index fiber can be substantially suppressed. It is shown how the constraint of Liouville's theorem, which was thought to preclude this effect, is satisfied in a system of two coupled fibers. The length of the coupled-fiber section required for operation is found. (9 refs.)
- 61297 Nonlinear absorption of light in glassy arsenic sulfide fibers in the energy range $h\nu < E_g$.** V.G. Abashkin, A.M. Andriesh, V.V. Ponomarev (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1343-5 (Oct. 1982). Translation of *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2070-4 (Oct. 1982). [received: April 1983] Nonlinear absorption of light was discovered in waveguides made of glassy arsenic sulfide at $h\nu < E_g$. The transmission of the fibers at $\lambda = 0.63 \mu$ m varied several fold as a function of the intensity of the radiation, and of the time for which it acted, for intensities exceeding 1 W/cm^2 . The recovery of the transmission coefficient also depended on the exposure conditions. The results obtained were interpreted on the basis of a two-step transition model. (6 refs.)
- 61298 Determination of the amplitude-frequency characteristics of W-type fiber waveguides.** I.V. Golubenko, V.V. Savvin, D.K. Sattarov. *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1347-9 (Oct. 1982). Translation of *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2078-80 (Oct. 1982). [received: April 1983] The results are given of theoretical and experimental investigations of the amplitude-frequency characteristics of fiber waveguides obtained using continuous optical radiation modulated by a microwave signal. A simple analytic expression is derived for the transfer function of an ideal fiber waveguide when a Gaussian light beam is coupled in and the numerical aperture of the fiber is considerably less than unity. The results are given of experimental determinations of the amplitude-frequency characteristics of quartz multimode fiber waveguides with a W-like profile of the refractive index, obtained in the

modulation frequency range 800-1250 MHz. The amplitude-frequency characteristics determined in this way are compared with calculated results. (4 refs.)

- 61299 Development of radiation resistant optical glass fiber.** K. Yagi, K. Shibuya, T. Iwamoto, K. Adachi, N. Sugiyama. *Showa Wire & Cable Rev. (Japan)*, vol.32, no.2, p.67-76 (1982). In Japanese. A study on the material, structure, characteristics and other factors of an optical fiber which is usable under a radiological environment has revealed the fact that pure silica core fiber is most excellent in resisting radiation. The study was also conducted in detail on the dose rate, temperature and effects that are imposed by OH contained in the fiber core on the transmission loss in actual applications. As a result, new knowledge had been gained on the basic transmission and mechanical characteristics of this fiber. It has been revealed that, when an optical glass fiber is irradiated with gamma rays, its transmission loss increases not with the increasing total dose but with the increasing dose rate, decreases with rising temperature and decreases with increasing OH concentration. As far as structure is concerned a fiber 50/125 μ m in diameter is recommendable as the pure silica glass core should be of the step index type. (12 refs.)
- 61300 Fiber optics takes its place in the subscriber loop.** G.W. Shaffer (Ohio Region of Mid-Continent Telephone Service Corp., Hudson, OH, USA). *Telephony (USA)*, vol.204, no.5, p.24-6 (31 Jan. 1983). Discusses Western Reserve Tel decision to choose a fiber optics system for its subscriber loop in order to reduce potential electrical interference from a nearby nuclear plant. The system includes six-fiber lightwave cable and a Timespan 128 pulse code modulation (PCM) pair gain system, both supplied by Anaconda-Eucsson Inc. The digital switching system includes a Litespan optical span card, which converts electrical signals to optical signals. (no refs.)

- 61301 Relevance of optics in electronic instrumentation for communication systems.** V.V. Rampal (Defence Electronics Appl. Lab., Dehradun, India). *CSIO Commun. (India)*, vol.9, no.1, p.18-21 (Jan.-March 1982). [received: March 1983] The increasing relevance of the optical band and the importance of optical feedback devices for providing optical analogues to electronic devices in communication systems is discussed with a view to project the futuristic trends. (5 refs.)
- 61302 Statistical connector loss estimation in optical fiber transmission line including a number of connectors.** Y. Koyamada (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan), Y. Tamura, A. Sakamoto. *Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan)*, vol.166B, no.1, p.63-70 (Jan. 1983). In Japanese. Statistical connector loss estimation is presented. Connector losses due to offset, tilt and mismatch of fiber parameters were estimated considering the distribution of connector plug dimensions and fiber parameters. The change of mode power distribution with the location of connectors along transmission lines were taken into account for the connector loss estimation. As an example, connectors used at the field trial of the intra-office optical transmission systems were examined. Good agreement was seen between estimated and measured connector losses. (7 refs.)

(Germany)*, vol.4, no.1, p.20-4 (March 1983). The application of a combination of nonlinear and integrated optics to obtain high-speed, real-time signal processing is demonstrated. Both second- and third-order nonlinearities are considered, and interaction geometries are given for real-time convolution, pulse compression and expansion, and time inversion. (10 refs.)
- 61304 Design of a new thin-film electro-optic switch.** P.S. Chung, K.S. Chiang (School of Electrical Engng. & Computer Sci., Univ. of New South Wales, Kensington, NSW, Australia). *Opt. & Laser Technol. (GB)*, vol.15, no.2, p.83-90 (April 1983). A new thin-film electro-optic switch employing two stable states of polarization is proposed and investigated. The design can be further employed to realize a TE-TM polarization converter by constructing a Mach-Zehnder type interferometer integrated optical switch. The limitations and design procedures for electro-optic devices are also discussed. (19 refs.)

61305 Joining a semiconductor laser to a planar optical waveguide. V.L.Aksenov, A.V.Kukharev, A.A.Lipovskii, A.V.Pavlenko, V.Yu.Petrunkin (M.I. Kalinin Polytech. Inst., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.358-9 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.828-31 (July 1982). [received: April 1983]

The effective exploitation of optical methods for information processing and transmission requires an extensive use of integrated-optics elements and devices. The authors have studied the possibility of joining an ILPN-102 standard CW semiconductor laser with a planar optical waveguide, using the end of the waveguide. (6 refs.)

61306 Two-channel integrated-optics multiplexer in a redundancy system. V.L.Maslennikov, Yu.A.Sarkisov, V.A.Sychugov, A.V.Tishchenko, Yu.F.Fedorov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.373-5 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.862-6 (July 1982). [received: April 1983]

The authors have developed a two-channel integrated-optics multiplexer which operates in a redundancy mode. The device consists basically of stripe waveguides in glass. There are two symmetric inputs, which are brought together to form a single output channel, and there is also a control channel, used in operation in the redundancy mode. The inputs and outputs are terminated with parabolic flare sections, which allow the system to be coupled to production-model semiconductor lasers. All the inputs and outputs are spatially separated; this is a very important consideration for the development of practical devices. (2 refs.)

42.85 OPTICAL TESTING AND WORKSHOP TECHNIQUES

61307 The sol-gel method for optical fiber fabrication. A.L.Harmer, R.Puyane, C.Gonzalez-Oliver (Battelle Res. Inst., Geneva, Switzerland). *IFOC Int. Fiber Opt. & Commun. (USA)*, vol.3, no.6, p.40-4 (Nov.-Dec. 1982).

The sol-gel method is a general technique for the preparation of glasses starting with inorganic salts or organometallic solutions. These solutions are transformed by polycondensation to a gel: a jelly-like solid which is highly porous. The next stage is to remove the rest of the solution from the pores by drying and then to sinter the gel, at relatively moderate temperatures, to a solid glass. Thus, optical fiber preforms may be produced from pure liquid starting materials and then pulled into fibers by conventional drawing techniques. The technique, which holds promise for mass production of optical fibers is described in detail. (no refs.)

61308 Monitoring method for axis alignment of single-mode optical fiber and splice-loss estimation. T.Hiabara, M.Matsumoto, T.Tanifuji, M.Tokuda (Nippon Telegraph & Telephone Public Corp., Tokai, Ibaraki-ken, Japan). *Opt. Lett. (USA)*, vol.8, no.4, p.235-7 (April 1983).

A new method for core-axis alignment and precise splice-loss estimation for single-mode optical fibers is presented. By using a differential interference contrast microscope one can achieve core-axis alignment with an offset below 0.3 μm , which results in a butt-joint loss increase of 0.04 dB compared with that obtained by alignment using a conventional optical monitoring method. Furthermore, splice-loss estimation with a precision of 0.05 dB is attained for a low-loss region without using an index-matching liquid. (5 refs.)

61309 On centering of lenses during cementing. V.M.Mudholkar, G.K.Sharma (Instruments Res. & Dev. Establ., Dehra Dun, India). *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.507-8 (April 1983).

An apparatus has been designed for direct viewing of centering errors in cemented doublets. The centering errors can be corrected in situ during cementing. This enables easy rectification and is applicable both to thermoplastic and thermosetting cemented lens systems. Multiple lenses can also be easily centered and cemented using this apparatus. (2 refs.)

61310 Investigation of the possibility of using an optical matching filter to test the geometry of parts in precision instrument manufacturing. V.I.Shanin. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.416-18 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.15-17 (July 1982). [received: April 1983]

The metrological possibilities of optical matched filtering in problems of checking the geometry of parts in precision instrument manufacturing are analyzed theoretically. A method is proposed for reducing the absolute testing error, and the requirements are established for positioning the parts at the input to the test system. (7 refs.)

61311 General-purpose UELI-1M electron-beam evaporator. L.Yu.Vol'fon, A.N.Kabanov, B.N.Vasichev, A.P.Bdulenko, V.V.Polivanov, A.G.Klyukov, V.I.Solomentsev. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.440-1 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.36-7 (July 1982). [received: April 1983]

A 6-kW general-purpose electron-beam evaporator, which has been developed and placed into batch production, is described. This equipment is designed for use in the optical industry. (1 ref.)

61312 Investigation of sintering activator distribution in refractory materials by means of an X-ray microanalyzer. E.E.Khrishch, V.K.Pavlovskii. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.442-4 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.38-40 (July 1982). [received: April 1983]

A method has been developed that uses the MAR-2 X-ray spectral microanalyzer to evaluate the distribution uniformity of sintering activators throughout the volume of a refractory for optical glass making and to determine the dimensions of regions having an elevated concentration of the introduced ingredients. (5 refs.)

61313 Optimizing the technology of fabricating low-stiffness optical plates. B.E.Shilshvskii, G.V.Maslakov, Z.A.Migus'kina, Z.E.Alekseeva. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.444-5 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.40-2 (July 1982). [received: April 1983]

The technology of grinding and polishing extremely low-stiffness 16×20×0.2 and 40×40×0.5 mm optical plates by employing differentiation of the operations, the use of high-stiffness tools, selective combining and special methods of blocking is examined. This technology makes it possible to increase the

labor productivity by ten times, stabilize the quality of the parts and mechanize the heavy manual labor. (2 refs.)

61314 Methods of in-shop testing of microscope optical-system centering. V.B.Rabinovich. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.446-8 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.42-5 (July 1982). [received: April 1983]

Two methods are examined for checking the centering of a microscope optical system: by using an autocollimation Gaussian eyepiece and telescope objective, and by using a centered objective heating an index mark. The errors that arise during testing by these methods are analyzed. (2 refs.)

61315 Micro Fresnel lenses blazed by electron beam lithography. T.Fujita, H.Nishihara, J.Koyama (Faculty of Engng., Osaka Univ., Suita, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.66C, no.1, p.85-91 (Jan. 1983). In Japanese.

The authors have examined a blazing technique using electron beam lithography in order to increase efficiency of micro Fresnel lenses. First, with respect to uniform-period linear gratings, the variation of diffraction efficiency as a function of deviation from an ideal sawtooth relief profile was calculated. Then, on the basis of the measured exposure-sensitivity characteristics of a PMMA resist, blazed gratings have been formed in the resist and an efficiency of more than 60% was achieved at 0.633 μm wavelength. By a similar method, blazed-type micro Fresnel lenses of 5 mm focal length and 1 mm diameter have been fabricated and a performance of 50% efficiency and nearly diffraction-limited focusing was confirmed. 43.20 GENERAL LINEAR ACOUSTICS

(see also 03.40K Mathematical problems in waves and wave propagation)

61318 Propagation of spherical waves above ground. R.Seznec, M.Berengier, V.Legeay (Lab. Central des Ponts et Chaussées, Bouguenais, France). *Appl. Acoust. (GB)*, vol.16, no.3, p.163-8 (1983).

A new methodology is developed for the problem of sound propagation above ground. The respective advantages of pure tones generated by a pressure driver with a $\lambda/4$ tube and impulsive noises issued from an 8 mm alarm pistol with a double cavity absorbing silencer, are analysed. Use is made of minimum phase linear systems for which the modulus and phase of the transfer function are related by a Hilbert transform. Finally, the different parameters of a locally reacting model are calculated using a nonlinear fitting procedure and the specific impedance values of the tested ground are estimated from the attenuations experimentally measured under grazing or oblique incidence. (4 refs.)

61319 Scattering of SH waves by spherical elastic layers. A.Gerard (Lab. de Mecanique Theorique, Univ. Pierre et Marie Curie, Paris, France). *Rev. Acoust. (France)*, vol.15, no.63, p.250-2 (1982). In French.

Determines the exact solution of SH wave propagation in a pattern of an infinite space containing a source point outside a finite number of concentric spheres without using Cramer's technique. The series solution obtained is interpreted in terms of multiple reflections and refractions and the assumption of the infinite interactions which accompanies the method proposed in Int. J. Engng. Sc. vol.18, p.583-595, (1980) is wholly justified. (8 refs.)

61320 Acoustic waves in a Rijke tube with radiation impedance. A.Trad (Lab. d'Etudes Aerodynamiques et Thermiques, Poitiers, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.3, p.177-80 (24 Jan. 1983). In French.

Considers a Rijke tube as a limit of a hot porous tube. An asymptotic theory is developed, to study acoustic waves in that tube, when the impedance of radiation at the ends of the tube has been taken into account. (3 refs.)

61321 Sound attenuation in lined rectangular ducts in the presence of fluid motion. Zhao Song-ling, Wu Mei-qin (Tongji Univ., Shanghai, China). *Acta Acust. (China)*, vol.7, no.6, p.380-6 (Nov. 1982). In Chinese.

The theory dealing with sound attenuation in lined rectangular ducts in the presence of fluid motion is discussed. The following improvements are made: 1. The figures representing the relation between the acoustic impedance on the boundary surface and the sound propagation parameter in narrow rectangular ducts in the static case are re-plotted and improved. 2. By introducing

certain equivalent parameters, a normal rectangular duct may be transformed into an equivalent narrow one. 3. In the presence of fluid motion the sound propagation parameter may be approached systematically by means of solutions obtained in the static case. (5 refs.)

61322 The finite element formula of sound field by the weighted residual method. Qin You-guo (Dept. of Architecture, Qinghua Univ., China). *Acta Acust. (China)*, vol.7, no.6, p.387-91 (Nov. 1982). In Chinese. The finite element formula of a sound field, in which there are sound sources of which the boundary is non-rigid and absorbent, can be worked out by the weighted residual method. The formulae of the characteristic value problem of a sound field, which has been deduced using a variational method, may be taken as a particular case. (4 refs.)

61323 Experimental investigation of the scattering effects of a sphere in a cylindrical resonant chamber. M.Barmatz, J.L.Allen, M.Gaspar (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.725-32 (March 1983). The resonance frequency, acoustic pressure, and quality factor for various longitudinal and transverse modes of a cylindrical chamber were measured as a function of sphere position along the chamber axis. In the limit of small spherical blockages, the shift in the plane-wave resonance frequency is proportional to the ratio of sample-to-chamber volumes, v_s/v , as predicted by analytical models. The frequency shift measurements are compared to a phenomenological model based on the ratio of sample-to-chamber cross-sectional areas, a_s/a , and sample diameter to chamber length, d_s/l . The frequency shift, $\Delta f/f_0$, for plane waves is proportional to a_s/a , d_s/l , and v_s/v for ratios less than about 0.2, 0.1, and 0.013, respectively. Measurements for large values of these ratios for spherical and cylindrical blockages are in good agreement with the three-dimensional Green's function theory of El-Raheb and Wagner [J. Acoust. Soc. Am. 72, 1046 (1982)]. An approximate analytical frequency shift expression is derived for the intermediate ratio region. The frequency shift measurements for modes containing a transverse propagation component were smaller in magnitude and different in shape than those of the plane-wave modes. (8 refs.)

61324 Bistatic low-frequency inverse scattering. N.N.Bojarski. *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.733-5 (March 1983). The monostatic acoustic and electromagnetic low-frequency inverse scattering solutions of this author [Office of Naval Research Contract N00014-76-C-0082 Report (25 July 1982); IEEE Trans. Antennas Propag. AP-30 (4), 775-778 (July 1982)] are generalized to the bistatic case. Specifically, derived are bistatic acoustic and electromagnetic low-frequency direct scattering approximations in terms of the characteristic function of a scatterer. These bistatic approximations satisfy the principle of reciprocity, and consist of a generalization of the monostatic-bistatic equivalence theorem, valid for wide bistatic angles. Unlike the monostatic case, for which the acoustic and electromagnetic low-frequency direct scattering approximations are identical, and for which the electromagnetic low-frequency direct scattering approximation fails to yield depolarization information, the bistatic acoustic and electromagnetic low-frequency direct scattering approximations are different, and the electromagnetic bistatic low-frequency direct scattering approximation does yield depolarization information. An inverse scattering solution for the complete set of moments tensors of this characteristic function is obtained. It is shown that this bistatic inverse scattering solution is a bistatic generalization of Rayleigh's monostatic volume law, yielding the Rayleigh volume of the scatterer for the moments tensor of rank zero. The moments tensors of rank one and two are shown to be the spatial position centroid and the principal dimensions (and their spatial orientation) of the scatterer, respectively. It is shown that the inverse scattering solution can be implemented with one transmitting and one receiving location, and a modest spatial spread in one, the other, or both locations. (8 refs.)

61325 Acoustic scattering by elastic solid cylinders and spheres in viscous fluids. W.H.Lin, A.C.Raptis (Components Technol. Div., Argonne Nat. Lab., Argonne, IL, USA). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.736-48 (March 1983). This paper deals with analytic studies and numerical results of the scattering of plane sound waves from an elastic circular cylinder and from an elastic sphere in a viscous fluid. The elastic properties of the cylinder and the sphere and the viscosity of the surrounding fluid are taken into account in the solution of the acoustic-scattering problems. The associated acoustic quantities, such as the acoustic-scattering patterns, the acoustic-radiation forces, and the acoustic attenuation, are first derived in closed forms and then evaluated numerically for a given set of material properties. Numerical results show that increasing fluid viscosity tends to increase the directionality of the angular distribution of the scattering patterns, especially in the forward direction. The acoustic-radiation force on the cylinder or on the sphere is in the direction of the incident wave and increases as the viscosity of the fluid increases. The plots of the acoustic-attenuation coefficients versus the dimensionless wavenumber of the incident sound wave reveal oscillatory phenomena, which are caused by the resonant vibrations of the cylinder or the sphere. 61326 Horizontal covariance of surface reverberation: Comparison of a point-scatterer model to experiment. C.R.Wilson, M.E.Frazer (Appl. Res. Labs., Univ. of Texas, Austin, TX, USA). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.749-60 (March 1983). A theoretical model of reverberation developed by D. Middleton was implemented to predict the spatial-temporal covariance of surface reverberation. The implementation assumed narrow-band transmissions and point scatterers treated as perfect point reflectors distributed uniformly over the plane of the mean surface level. The implementation of the model under these assumptions is presented, and the results are compared to experimental measurements of the covariance of surface reverberation measured by a horizontal array of receivers. The dependence of the covariance on spatial separation of the receivers, time, and time difference was modeled. The modeled results were found to agree well with the experimental measurements. The effects of off-axis scattering due to the azimuthal directivity of the projector and the bandwidth of the projector and receivers were shown to be significant and were also shown to be properly taken into account by the model. (25 refs.)

61327 Acoustical characteristics of rigid fibrous absorbents and granular materials. K.Attanborough (Engng. Mech. Discipline, Faculty of Technol., Open Univ., Milton Keynes, England). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.785-99 (March 1983). A model is developed that predicts the acoustical characteristics of rigid fibrous absorbents soils and sands from five parameters. These parameters are porosity, flow resistivity, tortuosity, steady flow shape factor, and dynamic shape factor. Tortuosity is shown to be related simply to porosity and a simple relationship between the shape factors is postulated. In practice, therefore, only two measurable parameters (porosity and flow resistivity) are required together with a third shape factor parameter, appropriate values of which are deduced for the media of interest by comparison with appropriate

measurements. The model is shown to give superior predictions to those of empirical formulae that use flow resistivity only, particularly when applied to high flow resistivity soils and sands at low frequencies such that the stated range of validity of the empirical formulae is exceeded. (28 refs.)

61328 Diffraction of spherical wave at a slit and an aperture in a plane screen. M.Yuzawa (Tohoku Inst. of Technol., Sendai, Japan). *J. Acoust. Soc. Jpn. (Japan)*, vol.38, no.12, p.755-63 (Dec. 1982). In Japanese.

A method of predicting the diffracted sound field behind the respective infinite plane screens with slits or a rectangular aperture is described. Macdonald's formula (1915) for a thin barrier and Pierce's formula (1974) for the double-edge diffraction by a thick three-sided barrier are used in this study, and this procedure for a rectangular aperture primarily follows Fresnel-Kirchhoff's diffraction theory. The calculated results for several kinds of small-scale model obtained by the present procedure, are compared with experimental results. (14 refs.)

61329 Finite-element analysis of topographic waveguides for acoustic surface waves using approximate analytical solutions for substrate region. M.Koshiba, M.Okada, M.Suzuki (Faculty of Engng., Hokkaido Univ., Sapporo, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan)*, vol.E66, no.2, p.75-81 (Feb. 1983).

An efficient finite-element program utilizing approximate analytical solutions is described for the analysis of topographic waveguides for acoustic surface waves. In this method, the only ridge region is divided into triangular elements, and therefore it is possible to use computer memory more economically. Calculations are made for the rectangular ridge waveguide, the dovetail ridge waveguide, the truncated knife edge waveguide and the wedge waveguide. The results obtained agree well with the earlier theoretical and experimental results. (18 refs.)

61330 The boundary value problem of the sound propagation in the rarefied gas. Yu.R.Romanovskii. *Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR)*, no.1, p.80-4 (Jan. 1983). In Russian.

Considers the boundary value problem of sound generated at an oscillating wall propagating into a halfspace. An existence and uniqueness theorem for the solution of this problem is proved for the linear Boltzmann equation with a general cut-off intermolecular potential for all frequencies. (5 refs.)

61331 Breadth effects on the penetration of an acoustic beam into a solid. P.Gatignon (Univ. de Technol. de Compiègne, Compiègne, France). *Rev. Acoust. (France)*, vol.15, no.63, p.246-9 (1982). In French.

Studies the refraction and the reflection of a bounded monochromatic acoustic beam at a liquid-solid interface. Using an analytical approach and a far-field approximation for the relevant Fourier integrals, it is shown that the highest pressure lines do not satisfy the usual Descartes laws. The corresponding angular shifts are computed for various values of the adimensional breadth k_a and of the incidence of the beam. Two different forms of incident beam are considered. (5 refs.)

61332 Propagation of finite-amplitude ultrasonic waves in air. I. Spherically diverging waves in the free field. J.A.Gallego-Juarez, L.Gaete-Garretón (Lab. de Ultrasonidos, Inst. de Acustica, Consejo Superior de Investigaciones Científicas, Madrid, Spain). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.761-7 (March 1983).

An investigation of the free-field propagation in air of sinusoidal spherical waves of finite amplitude is described. It includes experiments made at 20.4 kHz and a theoretical interpretation using weak shock theory. The acoustic source used was a new high-power and highly directional ultrasonic transducer which is able to generate a nearly pure sinusoidal wave at sound pressure levels over 160 dB. The experiments were done in an anechoic chamber, using a CW mode. They consisted essentially of measuring the amplitude of the fundamental component of the wave and its first three harmonics for different source levels and at various distances along the axis of the source. In addition, oscillograms and directivity patterns were recorded. In general, the experimental data confirm the predictions of the theoretical model. (10 refs.)

61333 Propagation of finite-amplitude ultrasonic waves in air. II. Plane waves in a tube. L.Gaete-Garretón, J.A.Gallego-Juarez (Lab. de Ultrasonidos, Inst. de Acustica, Consejo Superior de Investigaciones Científicas, Madrid, Spain). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.768-73 (March 1983).

For pt.1 see ibid., pt.73, no.3, p.761-67 (1983). This paper is concerned with an investigation of the nonlinear behavior of sinusoidal plane progressive acoustic waves of finite amplitude in air at a frequency of about 21 kHz. The various stages in the distortion of the wave have been experimentally studied and the results compared with theoretical models. The experiments were done in a tube 5.5 m long and 8-mm internal diameter with an absorbing termination. The acoustic source used was a prestressed piezoelectric sandwich transducer with a titanium stepped mechanical amplifier, the small end of which was the piston that produced the high-amplitude motion inside the tube. This source was capable of generating a nearly pure sinusoidal wave at sound pressure levels up to about 155 dB (re: 0.0002 μ bar). Interestingly, as compared to previous reports on this field, the use of a high frequency has allowed the study of all the propagation regions (including the old age region) of the wave using a short length tube. (11 refs.)

61334 Distortion of finite amplitude ultrasound in lossy media. M.E.Haran (Office of Radiological Health, Rockville, MD, USA), B.D.Cook. *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.774-9 (March 1983).

A form of Burgers' equation is used to derive an algorithm for calculating harmonic generation by a continuous plane wave of ultrasound propagating in a nonlinear, lossy, nondispersive medium. The algorithm accounts for attenuation that is not quadratically related to the frequency of the wave. Attenuation strongly affects the rate of harmonic production. The effect of variations

of the relationship between attenuation and frequency is shown. Biological tissue is an example of a highly lossy medium where the attenuation does not increase with the square of the frequency. Calculations for several types of tissue and biological fluids are presented that show, for certain conditions, finite amplitude distortion is possible. (15 refs.)

(see also 92.60 Meteorology)

61335 The dependence of sound extinction on the parameters of thermal turbulence in the atmospheric boundary layer. L.G.Shamanaeva (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.780-4 (March 1983). Scattering coefficients and normalized scattering phase function were calculated using the Von Karman spectrum of temperature fluctuations in the atmospheric boundary layer which enabled one to take into account the outer scale of turbulence. It was shown that the scattering coefficient had a quadratic frequency dependence and 1.68-1.69 power dependence upon the outer scale of turbulence. At the same time, the scattering cross section was proportional to the cube root of the sound frequency which agreed with the previously obtained results. The normalized scattering phase function was calculated for small scattering angles. It was shown that in the presence of small scale inhomogeneities in the atmosphere the portion of power removed from the original beam increases because the lateral scattering becomes prevailing. The obtained results are in good agreement with the experimental data. (14 refs.)

61336 The use of quasi-random scanning for designing sound scattering surfaces. M.Yu.Laneh, S.A.Pavlov, G.D.Tolstyykh. *Tekh. Kino i Telev. (USSR)*, no.3, p.3-6 (March 1983). In Russian.

Considers a method for designing sound scattering surfaces based on surfaces synthesis with caissons of various depths. A spectral method of determining caisson depths and evaluating a sound scattering surface quality is described. An example of such a surface is given and the results of evaluating sound scattering properties of the model surface are presented. (5 refs.)

61337 A corrected match for coherent part of time-variant channel. Xu Jun-hua, Chen-Geng (Inst. of Acoustics, Acad. Sinica, Peking, China). *Acta Acust. (China)*, vol.7, no.6, p.352-63 (Nov. 1982). In Chinese.

The detection performance of a matched filter with the transmitted signal as a reference signal will be degraded in an underwater acoustic channel due to the multipath effect and time variability. Two methods of channel match are presented in this paper: (1) Pulse-to-pulse correlation method for the channel match. (2) Deconvolution method. In the first method the received signal is used as a reference signal of the matched filter to improve the detection performance of the matched filter. In the second method a short pulse is used to excite the channel. To obtain the response function of the channel, the Wiener-Hopf equation in matrix form is used. The equation can be solved by several deconvolution methods. Then the solved response function of the channel is convoluted with the transmitted signal and the result of the convolution is used as a reference signal of the corrected matched filter. In this paper, with the aid of a computer the corrected match for several channel models and for the real underwater acoustic propagation channel is given and the comparison between the conventional and corrected matched filters is illustrated. (5 refs.)

61338 Coupled mode solution for a cylindrically symmetric oceanic waveguide with a range and depth dependent refractive index and a time varying rough sea surface. C.A.Boyles (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.800-5 (March 1983). The paper uses the technique of coupled, local normal modes to obtain an exact numerical solution of the Helmholtz equation for the case of a two-dimensional, oceanic waveguide which can possess both horizontal and vertical sound-speed gradients as well as time varying rough sea surface. By a two-dimensional waveguide, the authors mean one that can be described by two coordinates; viz., a radial coordinate r to describe variations with horizontal range and a depth coordinate z to describe variations with depth below the sea surface. The speed of sound in the waveguide $c(r,z)$ can then be a function of both range and depth. (29 refs.)

61339 Geometric dispersion of acoustic signals propagated in a deep ocean channel. K.D.Flowers (Naval Res. Lab., Washington, DC, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.806-9 (March 1983). In this paper the authors consider two sinusoidal signals generated in such a way as to have a constant frequency ratio. Then, except for dispersive effects of the propagation channel, the two signal frequencies should remain correspondingly related at a distant receiver. As a measure of this relationship a correlation function is defined for signals of different frequencies. The signals are assumed to have a frequency relationship $\omega_2 = q\omega_1$, where q is a real number. As an illustration of the use of this correlation function, model calculations are made of signals propagated over long ranges through the deep ocean. It is determined that geometric dispersion in a deep ocean channel degrades the correlation slightly but limits the precision to which q may be evaluated. The variations in q are directly proportional to q . It is found that the correlation function degrades with signal-to-noise ratio, q , and frequency. In general, it is concluded that the dispersive effects of the ocean channel at long range can be significant for broadband signals when signal coherence is an important consideration. (10 refs.)

61340 A cautionary note on the use of range-dependent propagation models in underwater acoustics. R.F.Henrick (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.810-12 (March 1983). A caution is given to the users of range-dependent models that utilize single ocean sound-speed profiles for discrete range intervals. It is shown that, if new profiles are not input every few kilometers, the effect of the discontinuities in the ocean may produce erroneous results. An example illustrates potential errors of as much as 18 dB using the parabolic equation method (PE) to compute propagation through a Gulf Stream ring. It is argued that range interpolation routines should be used to produce closely spaced profiles as a standard part of applying these acoustic propagation codes. (8 refs.)

61341 Optimum frequency of propagation in shallow water environments. F.B.Jensen, W.A.Kuperman (SACLANT ASW Res. Centre, La Spezia, Italy).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.813-19 (March 1983). The optimum frequency of propagation in shallow-water environments is the result of competing propagation and attenuation mechanisms at high and low frequencies. It is shown that the optimum frequency is strongly dependent on water depth, that it has some dependence on the sound-speed profile, while it is only weakly dependent on the bottom type. A comparison between experimental data and normal-mode theory indicates the importance of shear waves in the bottom, both in determining the optimum frequency of propagation and in determining the actual propagation-loss levels at lower frequencies. (23 refs.)

61342 On the calculation of normal mode group velocity and attenuation. R.A.Koch, C.Penland, P.J.Vidmar, K.E.Hawker (Appl. Res. Labs., Univ. of Texas, Austin, TX, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.820-5 (March 1983). The group velocity for a normal mode can be calculated without invoking a finite difference approximation requiring a second eigenmode calculation. The reciprocity relation is employed in a derivation of the normal mode group velocity and attenuation coefficient. The group velocity thus calculated is more accurate than a comparable finite difference approximation. Arbitrarily arranged layers of solid and fluid media are considered. (10 refs.)

61343 Transmission of a pulsed acoustic signal at a two-fluid interface. J.Naze Tjøtta, S.Tjøtta (Dept. of Math., Univ. of Bergen, Bergen, Norway).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.826-34 (March 1983). The transmission of an acoustic pulse with a plane front at a two-fluid interface is considered. An exact solution is obtained and several properties are derived. Numerical examples are given, showing patterns of the transmitted signal for different pulse shapes and incident angles. It appears that penetration at angles above the critical incidence (according to Snell's Law) is indeed possible, depending on how the incident pulse is shaped. This happens at the cost of a self-demodulation of the signal. (13 refs.)

61344 Response of underwater structures to convective component of flow noise. K.L.Chandiramani (Bolt Beranek & Newman Inc., Cambridge, MA, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.835-9 (March 1983). Convective component of flow noise (for example, a turbulent boundary layer) is characterized by length scales of the order U/f , where U is the mean flow speed and f is the frequency. Nonresonant response of underwater structures to the convective component of flow noise is often of interest. An exact theory of transmission of sound across an isotropic flat plate, involving longitudinal and shear waves, is modified so as to apply at high, convective wavenumbers. Closed form results are presented. Such results can in turn be used as inputs to scattering analyses, and as a guide to treating more complicated problems involving multiple-layered structures. However, these later topics are not the subject of this paper. (5 refs.)

61345 The input mobility of an infinite circular cylindrical elastic shell filled with fluid. C.R.Fuller (NASA Langley Res. Center, Hampton, VA, USA).

J. Sound & Vib. (GB), vol.87, no.3, p.409-27 (8 April 1983). The force input mobility of an infinite elastic circular cylindrical shell filled with fluid is derived by using the spectral equations of motion. Mobilities are evaluated and their physical interpretations are discussed for a steel shell of thickness $h/a=0.05$ filled with water and vibrating in the $n=0, 1$ and 2 circumferential modes. The results are subsequently used to analyze the related situations of wave transmission through a radial ring constraint and the far field vibrational energy distributions between the contained fluid and the shell wall for line and point driving forces. (12 refs.)

61346 Resonant oscillations of fluid-loaded struts. D.G.Crighton (Dept. of Appl. Math. Studies, Univ. of Leeds, Leeds, England).

J. Sound & Vib. (GB), vol.87, no.3, p.429-37 (8 April 1983). A simplified model is used to obtain a description of the way in which radiation damping limits the resonant oscillations of a cantilever or strut. It is shown that radiation damping is equivalent, in the low frequency limit, to a fictitious internal dissipation, with loss factor $\eta_m = (\pi/2)[m'/(m+m')](k_0 a)^2$, where $2a$ is the strut thickness, m its mass per unit length and m' the virtual fluid mass per unit length. Typical values of η_m appear to be slightly higher than internal loss factors, showing that the resonant amplitude is limited only

by radiation loss, even for thin struts for which $k_0a \ll 1$. When $k_0a \gg 1$ it is found that η_{rad} is much larger than any internal loss factor, and therefore that high frequency resonances are heavily damped, regardless of internal dissipation. The pressure field near the strut is also examined, and in the case $k_0a \ll 1$ is found at resonance to exceed the driving pressure field by the large factor $(k_0a)^{-2}$. The far field pressure at resonance may, under some conditions, also greatly exceed the off-resonance scattered field, and this great scattering efficiency of a thin strut at resonance is demonstrated by detailed examination of a particular case. 61347 Effect of size on measurements of the sound reduction index of a window or a pane. N.Michelsen (Danish Acoustical Inst., Tech. Univ. of Denmark, Lyngby, Denmark).

Appl. Acoust. (GB), vol.16, no.3, p.215-34 (1983).

The variation in the sound reduction index as a function of the size of a test specimen was investigated. Five different sizes of one particular hinged window were tested. In addition, tests were carried out with a sound insulating double glazing and a laminated pane mounted in normal wooden frames. Some differences in the sound reduction index due to the different test specimen sizes were found. However, these differences were slight compared with the practical difficulties and costs which tests on several sizes would involve. One size of test specimen is therefore considered to be sufficient for sound reduction index measurements in windows with respect to labelling. This practice is currently in use in Denmark. (7 refs.)
